Miners, Western Federation of. See WESTERN FEDERATION OF MINERS.

Minersville, mī'nérz-vīl, Pa., borough, in Schuylkill County; on the west branch of the Schuylkill River, and on the Philadelphia & R. and the Lehigh V. R.R.'s; about 45 miles north by east of Harrisburg. It is situated in the hard coal region, and its chief industries are connected with mining and shipping coal. Some

MINERVA—MINIM FRIARS AND MINIM NUNS

of its industrial establishments are machine shops, foundries, lumber and brick yards. Pop. (1890) 3,504; (1900) 4,815.

Minerva, *mī-nēr'vā*, in Roman mythology, a daughter of Jupiter, and one of the great divinities of the ancients. She was looked upon as the patroness of all arts and trades, and her annual festival, called Quinquatrus, lasted from the 19th to the 23d of March inclusive. She was believed to protect warriors in battle, and to her was ascribed the invention of numbers, and of musical instruments, especially wind-instruments. At Rome a temple was built for Minerva by Tarquin on the Capitol, where she was worshipped along with Jupiter and Juno; and there was also a temple on the Aventine dedicated to herself alone.

Mines, American. See AMERICAN MINES.

Mines and Mining, Law of. By United States law public mineral lands, both surveyed and unsurveyed, are open to free explorations, of opening and developing mines, on the conditions established by Congress. A mine located by a compliance with those conditions is the property of the locator, and he may lease, assign and convey it, giving a valid title. The owner of the soil may convey the mineral rights in a distinct grant, and thereby create one freehold in the soil and another in the mines, and each estate is entirely independent of the other, capable of being conveyed or inherited. The purchaser of a mineral right has, as an incident of his purchase, the right to open as many tunnels and shafts in the soil as are necessary to a convenient and complete operation of his property, to deposit the earth excavated upon the premises, erect suitable machinery and buildings, have free ingress and egress, and in a reasonable way to use the premises as he would his own in the prosecution of such business, and is responsible to the owner of the soil for abuse of his privilege only. The local laws relating to mines and mining are constantly being changed in their minor details.

Miniatur. See MANUSCRIPTS.

Miniature Painting, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. The art of illumination was expressed by the Low Latin verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving this delicate art entered on a new phase; copies in small dimensions of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits that a miniature in popular language came to signify "a very small portrait." Soon after their introduction miniature-portraits were executed with very great skill in England. Holbein (1495-1543) painted exquisite miniatures, and, having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (1547-1619) are justly held in high estimation. Isaac Oliver (1556-1617) was employed by Queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Peter Oliver (1601-47), achieved even a higher reputation. Thomas Flatman (1637-88) painted good minia-

tures. Samuel Cooper (born at London 1609, died 1672), who was with his brother Alexander a pupil of his uncle, John Hoskins, an artist of reputation (died 1664), carried miniature-painting to high excellence. Cromwell and Milton sat to him; he was employed by Charles II., and obtained the highest patronage at the courts of France and in Holland. Jean Petitot (1607-91) was the first to bring to perfection the art of enameling as applied to portraiture. There are as many as 58 examples of this great artist in the Jones Collection at the South Kensington Museum. Richard Cosway (1740-1821) was one of the most famous miniaturists of the 18th century. Robert Thorburn (1818-85) first made his name as a miniaturist, and many others might be mentioned; but the last famous miniature-painter was Sir William Ross (1794-1860), who lived to see his art superseded by photography. As to technical details, the early artists painted on vellum and used body-colors—that is, colors mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory fixed on card-board with gum were substituted. After ivory was substituted for vellum, transparent colors were employed on faces, hands, and other delicate portions of the picture, the opaque colors being only used in draperies and the like; but during the 19th century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work except the high lights in white drapery with transparent colors.

In the United States the first miniature-painter of note was Edward Greene Malbone, who in colonial days was a protégé of Benjamin West. His famous ivory, 'Hours,' is now in the Athenæum at Providence, R. I. After the days of Malbone the art was lost in America, and was not again revived until 1880. William J. Baer and Miss Laura C. Hills were the pioneers in this revival, and from 1880 to the present time the art has made remarkable headway. The painting on ivory in this country has developed into a distinctive American school, and is distinguished for sincerity, originality and creative ability. Miniatures are now accepted as a regular part of the winter art exhibitions in New York, Boston, and other cities.

Among American artists who have gained reputation as painters of miniatures may be mentioned W. J. Whittemore, Paul King, H. Vance Swope, Amalia Kussner, Alice H. Bremer, Miss Helen Kirchner, Florence Mackubin, Lydia F. Emmet, I. A. Josephi, Lucia F. Fuller, Virginia Reynolds, Alice Beckington, Theodora W. Thayer, Marie Humphreys, J. A. McDougall, Laura C. Hills, and William J. Baer.

Min'im Friars and Minim Nuns, an order instituted in the middle of the 15th century, and more correctly designated Minim-Hermits of Francis of Paula. They observe perpetual abstinence. The object of the order is both contemplative and active, as its members undertake the work of the ministry by preaching and hear-

ing confessions. They belong to the mendicant orders, and possessed, in 1900, several hundred convents.

Minimum Thermometer. See THERMOMETER.

Mining, the trade or profession of extracting minerals from their situations in the strata of the earth. There is reason to believe that it has been practised from the earliest periods of the world's history, and that the art of mining is coeval, or nearly so, with that of metallurgy (q.v.). In modern times mineral deposits are found in more or less horizontal or inclined beds or seams, in which the extension is parallel to the stratification of the enclosing rock, as in coal, salt and many iron ore deposits, and in veins or lodes, in which the extension intersects the stratification of the enclosing rock, as in deposits of the metals. In the case of horizontal beds lying parallel to the stratification of the surrounding rocks and below water level a shaft is sunk till the mineral is reached. Machinery is then used to extract the whole of the mineral, due precautions being taken to avoid danger from falls of roof and from noxious gases. In the case of veins or lodes and inclined beds the inclination and change of direction have to be studied. The miner looks unfavorably on vertical veins; for he considers that the chance of their being productive is much less than in inclined ones. In some cases a vertical shaft is sunk, and passages, known as cross-cuts, are driven from this to the vein at different levels. A vertical shaft presents the advantages of greater ease in sinking, hauling, and pumping. At the Comstock lode (q.v.) in Nevada, thousands of dollars were wasted in sinking a perpendicular shaft, the advantages of which were urged with considerable plausibility. A deep shaft may cost from \$50,000 to \$250,000. In the case of an inclined shaft the ore obtained from the shaft itself enables some of the charges to be recouped. In the Cornish copper mine, Tresevan, after an inclined shaft had been used for many years, a new shaft, 1,800 feet in depth, was sunk at a cost of \$100,000; but success had already been assured before this great outlay was contemplated. The best arrangement for an extensive mine is to have a main vertical shaft and several secondary inclined ones. With inclined shafts it is often out of the question to put in the highly-perfected engines used at collieries, the object being not the removal as quickly as possible of large quantities of material, but the exploration of the vein by slow and careful degrees at many points and with a moderate number of men. In the anthracite coal mines of Pennsylvania, however, a large majority of the mines are opened by inclined shafts or "slopes." For a general survey of the technical methods of mining see MINING ENGINEERING; for details of the coal mining industry see COAL MINING; for gold see GOLD MINING, etc. Also see MINES AND MINING, LAW OF.

Mining Engineering, that branch of engineering which pertains to the operations of extracting useful minerals from the deposits in which they occur. While no distinct line can be drawn between the fields occupied by mining and mining engineering, the former may be termed the art and the latter the science of min-

ing. The present article will be confined to a consideration of the qualifications, professional duties and training of the mining engineer; the subjects relating to mining as an art, namely, the modes of searching or prospecting for mineral deposits, the various systems or methods of working mines, and the details of the operations connected therewith, are dealt with under the head of MINING.

The province of the mining engineer comprises the testing and valuing of mineral deposits, the planning and execution of the various mining works required to reach the deposit—such as tunneling, shaft-sinking, etc.—the choice and application of a suitable method of opening the mine and bringing the ore to the surface; and lastly, the installation of the necessary surface and underground plant. In addition, therefore, to a knowledge of the theory and practice of the various kinds and methods of mining, the successful pursuit of the profession demands not only a training in mathematics, mechanics, physics, and other fundamental subjects which underlie all technical education, but also an intimate acquaintance with certain of the natural sciences, particularly geology, mineralogy and chemistry, and many of the principles of civil, mechanical, and electrical engineering. In a well-planned course of professional instruction the scientific studies would preferably come first, but the engineer is incomplete until to these is added a knowledge of the actual practice of mining. The arts of metallurgy, ore-dressing, and milling, moreover, are so related to the art of mining that these subjects also, at least in part, must be included in the equipment of the mining engineer. The functions of the mining engineer cannot be defined in precise terms, largely because of the infinite variety of local conditions which may be encountered, and the differing physical, mineralogical, and chemical characteristics of the ore deposits themselves. (See ORE DEPOSITS.) There has been perhaps a greater tendency toward specialization in mining than in other departments of engineering. As the professional field has broadened, no one man can hope successfully to cover it all. Quite a sharp distinction exists, for example, between metal mining and coal mining. The modes of deposition of coal and of the metalliferous ores, the geological and physical conditions, and the accepted systems of mining, are so different that the engineering of collieries has become largely a specialty. So again among the metals themselves. Engineers may be led to specialize in the direction of iron, or lead and zinc, or copper, or gold and silver mining. This latter differentiation is not the result of any fundamental diversity in the methods of developing and working the mines, but is due rather to differences in the scale of operation, the physical characteristics of the deposits themselves, the treatment of the ores of the various metals and their final disposition. It frequently happens that the dressing, or concentration, and even the smelting, or other process for the reduction of the ore, are carried on at or near the mine itself, and under the same general management. The mining engineer, therefore, must be something of a metallurgist also, and though not necessarily highly skilled in this direction, he should at least be able to decide upon and select the plant and process appropriate to the character of the ore, and to supervise its erection and

MINING ENGINEERING

operation. But this view applies chiefly to the mining and treatment of the non-ferrous metals. The metallurgy of iron and steel forms far too large a field to be included in the range of work of the mining engineer. It requires a special training, and has itself developed practically into a distinct profession.

Several more or less conventional distinctions are made as to the particular branch of work in which a mining engineer may specialize. He may devote himself to examining, valuing and reporting on mines, being engaged for such work by intending sellers or buyers; he may serve in the capacity of consulting engineer for one or more mining companies; or in doing a general business he may be retained by his clients in an advisory capacity similar to that occupied by a counsellor-at-law, leaving to others the actual execution of the work or the carrying out of the policy determined upon. On the other hand, a mining engineer who becomes identified with the management of the affairs of a particular company must be a successful organizer and business man; he must possess the ability to make favorable contracts for work, the purchase of material and disposal of product, to control men, and not only to plan work but to know how it should be executed to attain the best economic results. He often combines with his purely professional functions the duties of superintendent or manager, and the smaller the property, the greater usually is the variety of responsibility devolving upon the engineer. When in charge of a small or temporarily non-paying mine, especially one situated in a remote region, the engineer may be compelled to serve simultaneously in the capacities of superintendent, foreman, assayer and book-keeper. He must know enough of chemistry and of civil, mechanical and electrical engineering, to exercise intelligent control in matters relating to these branches, and he should have at least a general knowledge of mining law.

Formerly, the profession of mining engineering was less complex and exacting in its requirements than at the present time. The great advances made during the past 35 years in scientific and technical lines have brought with them constantly increasing responsibilities. An inspection of the course of study prescribed in mining schools of good standing will show how largely the education of a student in mining engineering lies in the direction of subjects not relating specifically to the art of mining itself. Manual labor has been more and more replaced by mechanical appliances, and the engineer must keep abreast of the times by alertness in availing himself of the innovations which have been introduced in endless variety: the ever widening applications of electricity and compressed air for the transmission of power, the numerous improvements in the machines and processes for the concentration and reduction of ores, the increase in knowledge of the relations of geology to the deposition of ores; all these constitute new tools in the hands of the mining engineer, but they unite also in demanding a broader and more severe training. Up to 1870 applications of electricity and compressed air to mining were practically unknown; now they are employed in nearly all departments of mine work. Compressed air rock drills are used everywhere for both surface and underground excavation of

rock; electric drills are rapidly gaining in favor; electric and compressed air locomotives or rope haulage have largely superseded hand tramping and haulage by mules and horses, wherever the quantity of material dealt with is sufficient to warrant the additional first cost of plant; the greatly increased depths at which mining is carried on in many districts have made necessary the design and erection of enormously powerful and complicated hoisting engines; and finally, the successful and economical operation of such plants requires the maintenance of well equipped machine and other repair shops.

The question of hoisting large quantities of ore from great depths, that is, vertical depths of say more than 5,000 feet, is one of the most serious mechanical problems at present confronting the mining engineer. Depths of approximately 5,000 feet have been already attained in several mining districts, notably in the Lake Superior copper region, the Witwatersrand in South Africa and elsewhere, while in the Butte, Mont., copper district, the silver mines of the Comstock Lode, Nevada, and the Bendigo gold fields of Victoria, Australia, depths of 3,000 to 3,500 feet have been or are being reached. In a number of places where the present maximum depth of shaft does not exceed 3,000 feet, elaborate engines capable of hoisting from 5,000 feet or more have been installed. The prosecution of work at such depths involves the solution of rather intricate problems, among which are: the proper construction of hoisting drums for winding the great lengths and weights of rope required, the design of reliable controlling apparatus for hoisting at speeds of 3,000, 4,000 or even 5,000 feet per minute, the means of raising and lowering with safety, speed and economy the hundreds of men required in large and deep mines, and the difficulties involved in the varying weight of the rope itself, as it winds upon its drum, a weight which often greatly exceeds that of the ore raised at each hoisting operation. A high degree of mechanical skill and knowledge is demanded for the effective solution of these and other problems, some of which have only recently presented themselves (*vide* the discussions on "Hoisting from Great Depths," which have appeared during 1902 and 1903 in the 'Transactions of the Institution of Mining and Metallurgy,' London, the South African Association of Engineers, and the 'Engineering and Mining Journal,' New York).

In all branches of his work the mining engineer of the present day finds himself compelled to introduce every new method and appliance that promises some saving in the cost of production. This is the direct result, not only of competition, but of the great reduction in market price of nearly all of the metals within the past three decades. In 1873 the price of silver was \$1.30 per ounce; now it is 58c; copper was then worth 30c per pound, now 13c; lead was then 6½c per pound, now 4¼c, and other similar examples of the decline in value of the staple metals can be cited. Furthermore, as the more easily accessible mineral deposits are exhausted, the mining engineer is called on to practise his profession farther afield, often in regions remote from centres of population. Here he may be confronted with new problems arising from the lack of transport facilities, dis-

MINING ENGINEERING

tance from source of supplies and materials, labor insufficient in quantity and poor in quality, and adverse and unhealthful climatic conditions.

That function of the mining engineer which relates to examining and reporting on mining properties is both delicate and difficult, and calls for the highest degree of professional efficiency. In brief, the examination of a mine includes a study of the local conditions, topographical, geological and economic, and of the mineral deposit itself; the mineralogical character, quality, quantity and grade of the ore and its value per ton; an estimate of the cost per ton of mining the ore and the net profit which reasonably may be expected; and lastly, the probable life of the mine. Upon these factors depends the market value of the property. In determining the quantity and grade of the ore, the deposit, as revealed by the development work already done, must be carefully and systematically tested. This is done by taking a series of samples in a manner which will enable the engineer to obtain a true average of such ore as can be examined and measured with sufficient accuracy and definiteness to warrant confidence in the results obtained. Evidently much depends upon how and to what extent the mine has been developed. The variety of conditions which may be met is almost infinite. Nature does not work with rule and plumb-line. Besides the ore which can be actually measured and sampled, the engineer may often be warranted in taking into consideration the quantity of ore which in the future will probably be rendered available by further development of the mine. In balancing such probabilities or possibilities, he must be guided mainly by geological and mineralogical analogies deduced from his previously acquired knowledge and experience. Lengthy discussions bearing upon this subject, by well-known engineers, have been published during 1902 and 1903, under the title of 'Ore in Sight,' in the 'Transactions of the Institution of Mining and Metallurgy,' the 'Engineering and Mining Journal' and the 'Mining Reporter.' It may be added that the circumstances under which mine examinations are made are often rendered difficult and embarrassing where the perpetration of fraudulent practices by interested persons may be attempted, for the purpose of misrepresenting or concealing the true condition of the mine; records of cost and of the value and amount of previous production may be falsified, or the samples taken by the engineer tampered with. Constant vigilance is required to guard against such contingencies.

With the development of the mining industry and the wider adoption of mechanical appliances and engineering methods in connection with mining operations, the demand for trained engineers has steadily increased until, at the present time, probably no field of engineering affords better opportunities for a young man. It is true that the course of preparatory study is exacting and the life somewhat arduous, but as yet it is one of the few professions which cannot be said to be over-crowded. Formerly, the so-called "practical" man monopolized most of the positions of responsibility and emolument, but the educated engineer has made his way to a degree that has produced an active demand for his services. Mining companies have found that the greater breadth of view resulting from a sound technical education has

a direct money value. The trained engineer is acquainted with what is being done in his profession in other regions or countries. He keeps himself informed as to the experiments and discoveries made by others; is quick to utilize improved and more economical methods, and knows not only what to do but also what to avoid. His competitor who lacks this knowledge, and who has at his command only what has come within his own personal experience, is in danger of failure, if circumstances bring him face to face with new conditions, and with problems the prompt and efficient solution of which must be based on a familiarity with the principles of engineering practice. It must be remembered that the young graduate of a mining school is not yet an engineer; he has been grounded in the fundamentals of his profession, has absorbed a multitude of facts relating to its practice, and his powers of observation have been cultivated; but before he is fitted to deal successfully with the diverse problems which sooner or later will confront him, he must in most cases patiently continue his education in the field for some years after graduation. His first employment is likely to be that of chemist, assayer, draughtsman, surveyor or assistant to one of the heads of department in the mine or works. How fast he advances will depend on his native energy and ability and the efficiency of his preparatory training. Not all young men are fitted by nature to become successful mining engineers. If the student has no aptitude for such a pursuit, the sooner he finds it out, the better, both for himself and his instructors. Unquestionably, an immense amount of time, money and energy are wasted in the attempt to give a scientific and technical education to young men whose bent—if they possess any decided bent—is in some other direction. The curriculum of the school, therefore, should be so planned as to eliminate inefficient students as early in the course as possible.

In the making of an engineer, circumstances and opportunity are important. A well-known engineer and instructor has said: "A man without school education may make a remarkable engineer; but it may have taken him years to get his training and at the end of the time there may be whole regions of knowledge utterly unknown to him; in other words, he is liable to be a one-sided man without a broad outlook upon other fields than his own. The school cannot teach him everything, but it can give him the keys to the storehouses which he may need to draw from in after life." A graduate of a good mining school has this advantage over his uneducated competitor: that he is better able to avail himself of the opportunities presented to him.

Mining Schools.—The need of technical schools specially equipped for preparing young men for the profession of mining engineering was long ago recognized in Europe, and some of the institutions there established have exerted through their graduates a marked and beneficial influence upon the mining industry of the world. The best known of the European mining academies are those at Freiberg (Saxony), Clausthal, Aix-la-Chapelle and Berlin (Prussia), Leoben and Przibram (Austria), Paris and St. Etienne (France), and London (England). In addition to these, separate schools for mine foremen are maintained at Freiberg, Clausthal,

MINING ENGINEERS—MINISTER

Aix-la-Chapelle, St. Etienne, Przibram and elsewhere. Previous to 1865, mining practice in the United States was based chiefly upon European methods, and the earliest work prosecuted on a large scale in this country—for example, at the Comstock mines, Nevada—was in great measure planned and managed by American engineers who had received their education in Europe. The influence of the Continental institutions also made itself felt in the organization of the older American mining schools. The first School of Mines in the United States was founded in 1863 under the auspices of Columbia College, New York. Since then, mining schools have been established in many parts of the country, the total number being now about 30. The majority of them, however, are small, with limited equipments and teaching forces. Many exist simply as departments of technical schools connected with State universities. A few are separate and distinct institutions. The leading mining schools of the United States are: the School of Mines of Columbia University, the Mining Department of the Massachusetts Institute of Technology, the College of Mining of the University of California, the State School of Mines of Colorado, the Michigan College of Mines, the School of Mines of the University of Minnesota and the schools at Lehigh University and Lafayette College. The courses of study leading to the degree of mining engineer occupy four years, but exhibit quite wide variations in plan and scope. Some of the best of the schools have rigidly prescribed courses; others offer a range of elective subjects, comprised in more or less interdependent groups. Without attempting a comparison of the curricula of these schools, a condensed statement of the ground covered by one of the leading institutions may here be given:

First Year.—Algebra—general theory of equations (elementary algebra required for admission), analytical geometry, spherical trigonometry (plane trigonometry required for admission), general inorganic chemistry, qualitative analysis, physics, descriptive and determinative mineralogy, including crystallography and blow-piping, theory of surveying and mechanical draughting. In the vacation following the first year, five weeks' field practice in surveying.

Second Year.—Calculus, elementary and analytical mechanics, physics, industrial chemistry, theory of railroad surveying, general geology, elements of electrical engineering, quantitative analysis, descriptive geometry and drawing. In the vacation following, five weeks' field work in general surveying and four weeks' railroad surveying.

Third Year.—Analytical mechanics, economic geology, properties and resistance of structural materials, masonry and timber construction, engineering of power plants, earth and rock excavation, railroad and mine tunnels, boring and shaft-sinking, exploration, development and methods of working mines, general metallurgy, and metallurgy of the non-ferrous metals, graphic statics, assaying, principles of electrical engineering, experimental mechanical engineering, optical mineralogy and petrography. Vacation work: five weeks' systematic study in mines selected for the purpose, one week's study in metallurgical works and one week of field geology.

Fourth Year.—Thermodynamics, steam engines and boilers, heat and its applications, motors other than steam, hydraulics, ore-dressing, mine engineering, mine plant and equipment, mine surveying, mine administration, metallurgy of silver, gold, iron and steel, draughting and design of mine plant, geological examinations and surveys, thesis or project in mining. Laboratory work is required in connection with geology, mineralogy, physics, qualitative and quantitative analysis, assaying, testing of materials, electrical engineering, metallurgy and ore-dressing.

Admission.—The requirements for admission to the best American mining schools comprise: Elementary and certain portions of advanced mathematics, elementary chemistry and physics, free-hand drawing, English, elementary history, elementary German and either elementary French, Latin or Spanish. Under certain circumstances, students may be admitted on certificate of other institutions.

Mining Engineers, American Institute of. See AMERICAN INSTITUTE OF MINING ENGINEERS.

Mining Industry, American. See AMERICAN MINES.

Minister, a high officer of state entrusted with the administration of national affairs. Collectively, the persons who constitute the administration are called in Europe the ministry, and also the cabinet. The cabinet of the President of the United States consists of the secretaries of state, treasury, war, navy, the interior, commerce and labor and of the attorney-general and postmaster-general. These ministers hold office at the pleasure of the President, by whom they are appointed subject to the consent of the senate. While in office they cannot hold seats in Congress. The term minister is seldom applied in the United States to members of the cabinet, but is used, as in Europe, to designate diplomatic officers. (See DIPLOMACY.) In Great Britain, of late years, the ministry has been formed by some eminent party leader who has the confidence of the House of Commons, and is authorized by the sovereign to organize a

MINISTER'S WOOING—MINNEAPOLIS

cabinet. The person thus charged with the task selects from his party or from those favorable to his policy the members of the ministry, taking himself generally the post of premier or prime minister, and commonly the office of first lord of the treasury. The other principal ministers are the lord chancellor, the three secretaries of state for home, colonial, and foreign affairs, the secretary at war, and the chancellor of the exchequer. The executive government of France is divided into 10 departments or "ministries," namely, of state, justice, foreign affairs, interior, finances, war, marine, public instruction and worship, agriculture, commerce, and public works, and Algeria and the colonies. See CABINET.

Minister's Wooing, The, a novel by Harriet Beecher Stowe, first published in serial form in the 'Atlantic Monthly' in 1859. The scene is laid in New England, and deals with the habits and traditions of the close of the 18th century. The "minister" in the tale is the famous Samuel Hopkins 1721-1803, the founder of "Hopkinsianism." The central purpose in this story is to show the sternness and inflexibility of the New England conscience, which clings to the Calvinistic doctrines through all phases of life. The struggle that goes on in the heart of the heroine and her mother when the brother and son, James, is supposed to be drowned unconverted, is a graphic delineation of the moral point of view at that time.

Min'ium. See LEAD.

Min'iver, the Siberian squirrel, which has fine white fur; also the fur itself.

Mink, a circumpolar species of weasel (family *Mustelidæ*), valuable as a fur-bearer, known in North America as *Putorius vison*, and in the Old World as *P. lutreola*, although substantially the same animal. The mink is a true weasel, with 34 teeth, and not a marten with 38; but it is of larger size, being about two feet long, one fourth of which belongs to the tail, and has a stouter form and bushier tail, more like the martens. Males are much larger than females. The mink differs greatly from both weasels and martens, and in those points in which it is modified toward this mode of life, namely, the half-webbing of the toes, short ears, and close-set, bristly, glistening pelage, it makes an approach toward the others. In color, the mink ranges from dull yellowish-brown to a rich blackish chocolate-brown. The ordinary color is a dark reddish-brown, growing blackish on the tail, and marked by a white patch on the chin of variable extent. The pelage consists of a dense, soft, matted, under-fur, mixed with long, stiff, lustrous hairs on all parts of the body and tail. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest and most glistening pelage; but the rough treatment given its coat by the animal in scrambling through holes and crevices in rocks, rotten logs and broken ice, so rapidly damages its fur that only the pelts taken in early winter show the fur to perfection and yield full value to the trapper. Both sexes are extremely odorous, due to the secretion, equally in both sexes, of a fetid musky scent in small perineal sacs opening near the orifice of the rectum, on each side; the smell is powerful, penetrating and lasting, and is under voluntary control of the animal,

but it cannot be discharged like that of the skunk, and is by no means so overpowering. The purpose of this secretion is undoubtedly the attraction of the sexes; and it is used to advantage by trappers as a scent-bait for their traps.

Minks occur in all parts of North America, and are so prolific, so well-supplied with food and so secretive, that they survive numerous even in the more thickly settled parts of the country. They abound near the coast and in the neighborhood of the larger lakes, rivers, and marshes, but are to be found along almost every stream, even in the driest portions of the interior. The minks cling to the water-courses where they find plentiful food in the form of meadow-mice, frogs, mussels, fishes (especially eels) and insects. In New England, at least, they feed largely on earthworms, getting them in plenty even in midwinter; and when very hungry, or a good opportunity offers, do not hesitate to attack larger animals, as muskrats—which they are able to pursue through underwater ways into their houses,—rabbits, partridges, ducks, and poultry. They search the stream-banks for prey, diving and swimming long distances with ease, go about under loose ice and snow, climb rough-barked trees, and penetrate crevices and hollows almost with the ease of a serpent, so that nothing is safe from their inquisitive ferocity; and in winter they wander widely.

Their own homes are made in burrows, usually, but not always, opening in the bank of a stream; and are more often accidental than carefully contrived. In some such retreat the female brings forth in early spring her litter of four or five young, which she guards with great care and courage from all enemies, including the males of her own species. The kittens, and the older ones, indeed, exhibit the same playfulness in and out of the water which characterizes otters.

No fur-bearing animal is so unsuspicious of traps and so easily caught as the minks, and they are the victims of boys and amateurs as well as of professional trappers in all parts of the country. The value of the pelts varies with their color, condition, size and the varying demand of changing fashion, but good ones are always of sufficient worth to make them reward the trouble of taking. When captured young they are easily habituated to confinement in suitable pens, and are tamable to a certain degree. They will breed in captivity, and several temporarily successful attempts have been made to rear them in large numbers for the sake of their pelts. They are fed upon fish, coarse meat, etc. The sexes are kept separate except during the month of March, and reproduction begins when the female is one year old. Tame minks make excellent ratters, doing the duty of ferrets.

Minneapolis, mīn-ē-āp'ō-līs, the largest city in Minnesota (q.v.), is located at Saint Anthony Falls (q.v.) on the Mississippi, 2,200 miles from its mouth. The name is derived from the Indian word *minne*, meaning water, and the Greek word *polis*, city. Minneapolis is situated on both sides of the Mississippi River, and covers an area of 53 square miles. The two parts of

MINNEAPOLIS

the city are connected by 17 bridges, nine of which are highway bridges, and eight railroad bridges. To the great water-power at Saint Anthony Falls are to be attributed in large degree the founding of the city and its remarkable subsequent growth and development.

Commerce and Industries.—The rapid increase in population is due to its unrivaled facilities for manufacturing and distributing, and to its location at the gateway of the rich agricultural region of the Northwest, whose population is largely supplied by its manufacturing and commercial interests. The increasing growth and importance of this territory adds yearly to the resources of Minneapolis, and has already made it the chief manufacturing and commercial city of the Northwest. Minneapolis is the largest primary wheat market in the world, and its flour milling (q.v.) industry exceeds that of any other city. Its mills have a capacity of 80,000 barrels daily, and the product is sent to all parts of the world. There were exported to foreign countries in 1902 more than 3,400,000 barrels, while over 16,200,000 were sold in this country. The elevator interests are also great. These, together with the flour mills, furnish employment to many thousands of men. The manufacture of breakfast foods has already become a large industry and is constantly gaining in importance. It was in the manufacture of lumber that the water-power at Saint Anthony Falls was first utilized, and from that beginning Minneapolis has become the largest lumber (q.v.) centre in the United States. The capacity of its lumber mills is about 3,500,000 feet a day, and it is estimated that not less than 10,000 men are employed in all departments of the work. Not only is a large part of this lumber manufactured in Minneapolis, but such are the distributing advantages of the city that much material manufactured in other parts of the West is shipped here for sale and distribution to other points. The proximity of the city to a great and rich agricultural district has made it a favorable point for the distribution of agricultural implements, and in its jobbing trade, in this department, it hold the second place in the world. It is also the centre of an increasing manufacturing industry in agricultural implements, and as the large area of unoccupied land in the Northwest is settled, it is evident that this industry alone will reach vast proportions. The yearly value of the manufactured product in this line already exceeds \$6,000,000. The woolen mills of Minneapolis are well known. Their output is considerable and the quality of their product is excellent. The manufacture of boots and shoes is also an important and growing industry, and the manufacture of clothing for the wholesale trade is increasing at a rapid rate. Minneapolis is also a furniture manufacturing centre. Office and school desks made here are sold in all parts of this country and also shipped abroad. The manufacture of iron and steel has increased very largely in the last few years, and this bids fair to become one of the leading industries of the city. On account of the number of flour mills the making of boxes and barrels is an industry of great importance. The nearness of the city to the flax fields has made the manufacture of linseed oil an extensive industry. The manufacture of paper is carried on here, and the brewing interests are also heavy. Indeed, it would be difficult to name any kind of manufac-

turing which is not carried on in Minneapolis, and the rapid growth of the country tributary to it gives promise of a rapid development of all manufacturing industries in the immediate future.

Parks.—The natural advantages of Minneapolis have been of great value in the development of its park system, upon which much money has already been expended, and the system, when fully completed, will be one of the most beautiful in the country. The park area is about 1,800 acres, and its estimated value over \$5,000,000. The driveways, which come under the control of the Park Board, aggregate nearly 30 miles in length. Connected with the system and lying within the city limits are four beautiful lakes, the largest of which, Calhoun, over a mile long, is less than three miles from the business centre of the city, with which it is connected by a fine boulevard as well as by an electric railway. Harriet, the second in size, is a short distance farther away, and during the summer months is the favorite resort of thousands of people. The remaining lakes are Cedar Lake and Lake of the Isles. Minnehaha Falls, made famous by the poet Longfellow, is also within the city limits and under the control of the Park Board, and is always a point of great interest to visitors from other cities, as well as a favorite resort for the children of Minneapolis. Steps are now being taken to further improve the banks of the Mississippi and when the plans are carried into effect the drive along the river will be most beautiful.

Schools and Colleges.—Minneapolis is recognized as the educational centre of the Northwest. It has an efficient system of public schools with 59 school buildings, 950 teachers, and about 40,000 pupils. Great interest is taken in the school system by the people, and they contribute generously to its support. There are four high schools which in 1902-3 enrolled over 3,800 pupils. Minneapolis is also the seat of the University of Minnesota, which has become one of the largest institutions in the country, the enrolment during the year of 1902-3 being 3,788. Excellent courses of study are presented in all departments and it takes high rank among the universities of the West.

Public Buildings.—Minneapolis is noted for its public buildings, among which will be found some of the finest in the West. The courthouse and city-hall covers an entire block. It is built of granite, is five stories high, and has a tower 400 feet in height; and cost about \$3,500,000. Among the other fine buildings are the Public Library, Guaranty Loan Building, New York Life Building, Andrus Building, Chamber of Commerce, Masonic Temple, Syndicate Block, Glass Block, Lumber Exchange, and West Hotel.

Railroads and Water Routes.—The transportation facilities of Minneapolis are excellent. Ten different lines of railway are represented with their branches and subdivisions, and all have large terminal facilities in the city. Seven railways connect Minneapolis directly with Chicago. The completion of the improvements in the Mississippi River between Saint Paul and Minneapolis will make Minneapolis the head of navigation and give direct water connection with the Gulf of Mexico. The United States government will expend several hundred thousand dollars in these improvements.

COUNT-AMOUNT AND OF

MINNEAPOLIS—MINNESOTA

Street Railways.—Minneapolis has a fine system of electric railways, reaching into all sections of the city, and affording direct connection with all the parks and other places of interest. It is owned by the Twin City Rapid Transit Company, which also controls the system in Saint Paul, with which city Minneapolis is already connected by two interurban roads, and a third is being built. The entire system covers 250 miles. Electricity, which is the motive power, is generated by the water power at the Falls. The company also has a manufacturing plant in the city where it manufactures its own cars and carries on its extensive work of repairs.

Churches.—Minneapolis has a large number of churches, all denominations being represented. Among the finest church buildings are Wesley Church (Methodist), Westminster Church (Presbyterian), and Church of the Redeemer (Universalist). Of the Protestant denominations the Lutherans have the largest membership. Among the other large denominations are the Congregationalists, the Presbyterians, the Methodists, the Baptists, and the Episcopalians. The Roman Catholics have many churches and a large membership. Pop. (1870), 13,066; (1880), 46,887; (1890), 164,738; (1900), 202,718.

CHAS. M. JORDAN,

Superintendent Minneapolis Public Schools.

Minneapolis, Kan., city, county-seat of Ottawa County; on the Solomon River, and on the Atchison, T. & S. Fe and the Union P. R.R.'s; about 130 miles west of Topeka. It is in an agricultural and stock raising region. Its chief industrial establishments are flour-mills, grain elevators, foundry, carriage shops, and creamery. Stone quarries in the vicinity contribute to the industries of the city. The principal buildings are the churches and the school. The public library has about 3,000 volumes. Pop. (1890) 1,756; (1900) 1,727.

Minnehaha, mĭn-ĕ-hă'hă, Falls of (Sioux, *Mini-haha*, "laughing water"), a cascade in the Minnehaha River, now in Minnehaha Park, which belongs to Minneapolis, Minn. The cascade has a fall of about 60 feet, and is in a picturesque glen which extends to the Mississippi River. Just below the falls the river is spanned by a rustic bridge. The name has become world-known through Longfellow's 'Hiawatha.'

Minnequa, mĭn-ĕ-kwă', or **Minnequo Springs**, Pa., a summer watering resort in Canton Township, Bradford County, picturesquely situated in a glen, surrounded by wooded hills, on the Northern Central railroad, 36 miles south of Elmira. It is frequented for its medicinal mineral springs containing carbonates of soda, magnesia, lime, etc.

Minnesinger, min'ĕ-sĭng-ĕr, or **Minnesänger** (from Old German *minne*, love), the name given to the German lyric poets of the 12th and 13th centuries on account of love being the chief subject of their poems. The cradle of German lyric poetry was Upper Austria. The earliest German poetry was chiefly narrative, and this not only when past events formed the poet's theme, but also when he celebrated present occurrences. But this contact with the present naturally gave occasion to the expression of the poet's feelings, and gradually led to the lyric pure and simple. Such was the origin of

the oldest extant poems of Dictmar von Eist (1143-70) and others. But the development of German lyric poetry was greatly hastened by the influence of the French poetry of the same class, which at that time flourished in Champagne and Flanders. The immediate effects of this French influence were greater strictness and variety in the versification, a greater preponderance of the subject of love, and a more purely lyrical treatment. The Westphalian Heinrich von Veldeken, afterward regarded by the minnesingers as the true father of their art; Friedrich von Hausen, a native of the Palatinate; the Thuringian Hugo von Salza; the Saxon Heinrich von Morungen; the semi-mythical Heinrich von Ofterdingen; and the two Swabians Heinrich von Rucke and Ulrich von Gutenberg, were the chief minnesingers of the latter half of the 12th century. The 13th century witnessed the highest cultivation of the minnesong, and also the beginning of its decay. Its greatest masters are Walther von der Vogelweide, Wolfram von Eschenbach, Gottfried von Strassburg, and Hartmann von Aue. After the art had ceased to be practised by the minnesingers, it was taken up by the artisans of the towns under the name of *meistersingers* (q.v.).

Minnesota, min-ĕ-sō'ta, one of the States of the Union, almost in the exact centre of the northern boundary, situated between lat. 43° 30' and 49° N. and lon. 89° 29' and 97° 5' W. It is bounded on the north by the Northwest Territories of British America, on the east by Lake Superior and the State of Wisconsin, on the south by Iowa, and on the west by North and South Dakota. It has alternately been termed the "North Star" and the "Gopher" State, the former appearing upon the official seal, but at the Pan-American Exposition at Buffalo in 1901 the name "Bread and Butter State" was suggested by the exhibits of breadstuffs and dairy products made by Minnesota. It takes its name from two Sioux words meaning "sky-colored water." The floral emblem of the State is the moccasin flower, or lady's slipper. The Territory of Minnesota was organized in 1849 and the State formally admitted into the Union, 11 May 1858.

Extent and Population.—Minnesota has an extreme length, from north to south, of 380 miles, and its breadth varies from 263 to 338 miles. It has an area of 83,365 square miles, or 53,353,600 acres, including over 10,000 lakes, occupying an estimated surface of 4,300 square miles. The twelfth census of the United States in 1900 showed the population of Minnesota to have been 1,751,394. Comparison with the previous decennial periods is as follows:

CENSUS YEARS.	Pop.	Increase.	
		No.	Per Cent.
1900.....	1,751,394	449,568	34.5
1890.....	1,301,826	521,053	66.7
1880.....	780,773	341,067	77.6
1870.....	439,706	267,683	155.6
1860.....	172,023	165,946	2,730.7
1850.....	6,077

History.—The area of Minnesota, when it first became known to white men, was occupied

MINNESOTA

by the Dakota (or Sioux) and the Ojibway (or Chippewa) Indians. Advancing from the region of Lake Superior, the Ojibways, in their almost continual wars with the Sioux, wrested from them the region of Mille Lacs about the year 1750, and were thenceforward in possession of nearly all the wooded northeastern two fifths of Minnesota, while the Sioux held its great prairie country on the south and west. But the outbreak of the Sioux in 1862 caused them to lose their homes here, being driven into the Dakota Territory. About 8,000 Ojibways live now on reservations in the northern part of the State. Previous to the settlement and occupation of this area by the white immigration, which may be said to have begun when the Territory of Minnesota was organized, in 1849, there were nearly two centuries of gradually increasing knowledge of the geography of this State. During the first century its explorers were the French, chiefly led to this distant region for the profits of the fur trade. After the British conquest of Canada, the explorers were English-speaking fur traders and travelers; and in the later expeditions were sent by the United States government to acquire information of the unsettled parts of the Northwest Territory and the northern part of the Louisiana Purchase.

The history of Minnesota is thus divisible into three parts: (1) The period of French exploration, 1655 to 1763, the date of the cession of Canada to the English; (2) The period of English colonial and United States exploration, 1763 to 1849; (3) The period of development as a Territory and State, 1849 to the present time. After the discovery of the lower Mississippi in 1541 by the ill-fated De Soto, 114 years passed before this river was next seen by Europeans. Then, in the year 1655, two hardy French explorers, Groseilliers and Radisson, appear, according to the narrative of the latter, to have crossed Wisconsin to the Mississippi, and to have voyaged up the river to the large island in Minnesota, now called Prairie Island, west of the main channel of the Mississippi above Lake Pepin, between the present sites of the cities of Red Wing and Hastings. This was during the first two expeditions, in each of which these earliest pioneers of exploration in Minnesota advanced far beyond all who had preceded them. In 1679-80, DuLuth and Hennepin were in Minnesota, at Mille Lacs and on the Mississippi; Le Sueur explored the Mississippi and Minnesota rivers in 1683-1700; and in 1731-49 Verendrye and his sons established trading posts along the northern boundary of Minnesota. Soon after Canada was ceded to the English, a colonial captain, Jonathan Carver, traveled in 1766 from Boston to Minnesota, and wintered among the Sioux Indians near the site of New Ulm. In 1798, David Thompson traversed and mapped the region of Red Lake and of the Turtle Lake and river, the latter being tributary to the Mississippi near its source. In 1804, William Morrison was at Itasca Lake, the head of the Mississippi, and in 1832 this lake was visited and named by Schoolcraft.

The first United States government expedition sent into this area was led by Lieut. Zebulon M. Pike, in 1805, only two years after the Louisiana Purchase, which included the western two thirds of Minnesota, on the west side of

the Mississippi River. Pike wintered on the Mississippi at Pike Rapids, near Little Falls, and visited the fur trading posts on Sandy, Leech and Cass lakes. He obtained from the Sioux, by a treaty, a tract adjoining the mouth of the Minnesota River and reaching to the site of Minneapolis, for military uses; and on this tract, on the bluff at the junction of the Minnesota with the Mississippi, Fort Snelling, at first called Fort Saint Anthony, was built in 1819-22. The first steamboat, the Virginia, came up the Mississippi to Fort Snelling, 10 May 1823. A second exploring expedition, under the command of Gen. Lewis Cass, came from Detroit in 1820, passing through Lakes Huron and Superior to Sandy Lake and thence up the Mississippi to Cass Lake, which was so named at this time by Schoolcraft, the historian of the expedition. Three years later, Major Stephen H. Long, with a military escort and several scientists, traversed the country west and north from Fort Snelling to the Red River and Lake Winnipeg, and returned east along the canoe route of the northern boundary to Lake Superior. Beltrami, an Italian political exile, was in Long's company to the vicinity of Pembina, and thence traveled alone, or with Indian companies, past Red and Turtle lakes, and down the Mississippi to Fort Snelling. Among the later explorers were Schoolcraft, Featherstonhaugh, Catlin, and Nicollet, the last making a most admirable map in 1842, of the upper Mississippi country before it had any agricultural settlement.

Minnesota was organized as a Territory by Governor Alexander Ramsey, 1 June 1849, then extending west to the Missouri River. It was admitted to the Union as a State, 11 May 1858, with its present area. The first governor of the State was Henry H. Sibley, and the second State governor through the early part of the Civil War was Alexander Ramsey, later United States senator (1863-75). In 1851, by treaties with the Sioux, Governor Ramsey and Luke Lea, commissioners for the United States, acquired the fertile prairie region of southern and southwestern Minnesota for white settlement. On 18 Aug. 1862, an outbreak of the Sioux began in which 800 of the settlers were massacred; 23 September, the hostile savages were overwhelmingly defeated by General Sibley in the battle of Wood Lake: their white prisoners, about 150 women and children, were released; many of the captured Sioux were soon afterward tried, and in December 38 were executed at Mankato. In the ensuing frontier campaigns of 1863 and 1864, the Sioux, who had fled into the Dakota Territory, were severely chastised. Governor Ramsey, in April 1861, was the earliest among the governors of the States to tender troops to President Lincoln at the beginning of the Civil War. During this war 12 regiments were raised by this State and, with later recruits for these regiments and enlistments of Minnesota men in other States, about 25,000 of her citizens served in the War.

Topography.—The chief topographic features of Minnesota are as follows: the valley of the Mississippi River, from Lake Pepin southward, several miles wide, and enclosed by bluffs 200 to 600 feet high; the basin of the Minnesota River, a slightly undulating expanse, 900 to 1,100 feet above the sea; the broad and flat

MINNESOTA

Red River Valley, 800 to 950 feet above the sea; the Coteau des Prairies, in southwestern Minnesota, which rises 1,800 to 1,950 feet above the sea; the Leaf Hills, 100 to 300 feet high, being 1,000 to 1,750 feet above the sea; the Giants Range and the Mesabi Range, north of Lake Superior, each 1,800 to 2,200 feet above the sea, being the highest land in the State; and the Sawteeth Mountains near the northwest shore of Lake Superior, 1,500 to 1,800 feet above the sea, or 900 to 1,200 feet above the lake. To the elevations already stated the following may be added: Lake Superior, 602 feet; Rainy Lake, 1,117; the Lake of the Woods, 1,060; the Red River at the northwest corner of the State, low stage 748; Lake Itasca, 1,462; the Mississippi River at Minneapolis, above the Falls of Saint Anthony, 800; in Lake Pepin, 664; at the southeast corner of the State, low stage, 616; Red Lake, 1,172; Mille Lacs, 1,251; Lake Traverse, 970; Big Stone Lake, 662; and the southwest corner of the State, about 1,400 feet. Prof. N. H. Winchell estimates the average elevation of the entire State to be approximately 1,275 feet above the sea. The river systems of Minnesota include that of the Mississippi, draining about 48,700 square miles of this State, or more than half of its whole area, which is 84,286 square miles; the Missouri River, whose basin includes about 1,700 square miles in this State; the Red River of the North, draining about 15,100 square miles in Minnesota, and the Rainy River, about 10,300, making 25,400 square miles tributary to Hudson Bay; and the basin of Lake Superior and the St. Louis River, tributary to the St. Lawrence, about 8,500 square miles. It is estimated that this State contains 1,000 lakes and the part of its area occupied by water is approximately 5,600 square miles. But there are few or no lakes in the southeast and southwest corners of the State, beyond the outermost moraines of the glacial drift, nor on the flat land of the Red River Valley. Forest originally covered the northeastern two thirds of Minnesota; while the other third, at the south and southwest, and reaching in the Red River Valley to the international boundary, was prairie.

Climate.—The mean annual rainfall, as known by long series of records, is about 34 inches in the southeast corner of Minnesota, 28 to 32 inches about Lake Superior and Rainy Lake; thence diminishing westward to 22 inches at Moorhead and Fargo, and nearly the same at Lakes Traverse and Big Stone, on the west boundary of the State. It is about 28 inches at Saint Paul and Minneapolis. The mean temperature for the year is 46° F. in the southeast corner of the State; 44° at Saint Paul and Minneapolis; and 36 to 34° in northern Minnesota. For January, the coldest month, the mean is 14° in the southeast corner; about 12° at Saint Paul, Minneapolis, and Duluth; and thence it diminishes northwestward to zero at the Lake of the Woods and 2° below zero at Saint Vincent, in the northwest corner of Minnesota. For July, the warmest month, it is 76° in the southeast and southwest corners; 74° at Saint Paul and Minneapolis; about 72° at Moorhead and Fargo; 68° at Saint Vincent; and 64 to 62° in northeastern Minnesota north of Lake Superior. The elevation of this State above the sea, its fine

drainage, and the general dryness of the air, give it a climate of unusual healthfulness.

Geology.—The rock formations of Minnesota, mapped in the geological survey of the State, by Prof. N. H. Winchell, the State geologist (1872-1901), with Warren Upham, U. S. Grant, and others, as assistants, are as follows: glacial and modified drift, spread over all the State excepting its southeastern corner; Fort Pierre, Niobrara, and Fort Benton shales and sandstones, of the Cretaceous series, thinly occupying many tracts throughout the western two thirds of the State, and thickly developed as the chief mass of the Coteau des Prairies, beneath the drift; Devonian limestones and shales, of the Hamilton and Marcellus epochs in Fillmore and Mower counties, and extending into Iowa; Silurian limestone and shales, belonging to the Hudson River and Trenton epochs, reaching from Minneapolis and Saint Paul south and southeast to Fillmore county and northeastern Iowa; Cambrian sandstones and limestones, including the St. Peter sandstone, Shakopee limestone, Jordan sandstone, regarded as the equivalents of the Chazy and Calcareous formations in the northeastern States and Canada, extending in southeastern Minnesota from the Kettle River and Taylor's Falls southwest to the lower portions of the Minnesota and Blue Earth rivers, and occupying a considerable belt along the St. Croix and Mississippi rivers to the southeast corner of the State; the Keweenaw or Cuprifera series, of Lower Cambrian and Algonkian age, consisting of red sandstone conglomerate, and trappean rocks, on the border of Lake Superior, and in Pine, Chisago, and Kanabec counties, but in southwestern Minnesota being mainly red quartzite, exposed near New Ulm, and thence in a few areas westward to Pipestone and Rock counties, in the southwest corner of the State; and the Archean system, of gneisses and granites, schists and slates, together covering more than half of the State, reaching on the international boundary from the Lake of the Woods east to Lake Superior, and extending thence southwest to the Minnesota River between Big Stone and New Ulm, but terminating about 30 miles southwest of this river.

During the Glacial period or Ice age, the latest completed geologic period before the present, this State was enveloped by the northern ice-sheet, excepting a tract on its southeast border, which was a part of the Driftless area. When the ice-sheet was melted away, its drift was left as a general covering of the bed-rocks, the average thickness of the drift upon the western two thirds of the State being about 100 feet, but toward the east, as also north of Lake Superior. A series of the twelve marginal moraines has been mapped, crossing Minnesota, being belted of hilly, knolly, and ridged drifts, with a much larger proportion of boulders than on the smoother areas. These moraines mark the successive outlines of the front of the departing ice-sheet, at times of pauses or slackening of its general retreat and marginal melting.

In the Red River Valley, sloping northward in the direction of the glacial recession, a great ice-dammed lake, named by Upham the Glacial Lake Agassiz, was held by the waning ice-sheet, which was its northern barrier. This ancient lake attained a length of about 700 miles

MINNESOTA

extending far into Manitoba and the Saskatchewan basin, with a maximum width of about 200 miles and an area of 110,000 square miles, or more, thus exceeding the combined areas of the five Great Lakes tributary to the St. Lawrence. The outlet of Lake Agassiz eroded Brown's Valley, between Traverse and Big Stone lakes, and flowed thence along the course of the Minnesota River into the Mississippi. Many ridges of sand and gravel, and extensive sand deltas, along the sides of the Red River Valley, show the successive boundaries of this old glacial lake, which sank from higher to lower levels as its channel of outlet was deepened, and when later it flowed by other outlets north-eastward. Finally, by the continued recession of the ice-sheet, Lake Agassiz was reduced to its present representative, Lake Winnipeg, uncovering the fertile valley of the Red River, now the most productive wheat district of our continent.

Farming and Agricultural Products.—Minnesota is the tenth State in the Union in area. There are in the State 155,000 farms aggregating 27,000,000 acres, of which about 20,000,000 is improved land. Thousands of acres of swamp land worth \$2 an acre have been reclaimed by the ditch work system perfected by the State Drainage Commission and are worth to-day \$10 an acre. This work is in its infancy as yet, and consequently thousands of acres remain to be reclaimed to agricultural purposes. The total value of all the farm property in the State is \$900,000,000, of which live stock and farm equipment represent about \$150,000,000. The total value of the farm products of the State is \$185,000,000. Wheat is the most important single crop in Minnesota. In wheat raising Minnesota ranks first among all the States of the Union. Over half of the State's acreage is in wheat. The wheat crop ranges from 90,000,000 to 100,000,000 bushels a year. Minnesota produces one seventh of all the wheat raised in the United States. Minnesota also raises one fifth of all the barley raised in the country and ranks second among barley-producing States, with an average crop of 30,000,000 bushels annually. In the value of all cereals raised Minnesota ranks fourth among the States, with a total crop of 260,000,000 bushels and a crop value of \$90,000,000. Minnesota produces 75,000,000 to 90,000,000 bushels of oats and 15,000,000 bushes of potatoes annually, ranking fourth in oat production and ninth in potato production. As an adjunct of the purely agricultural products of the State the creamery interest is one of the great industries of the State. Minnesota ranks fifth in the value of her dairy products. There are in the State 700 creameries which are supplied by 54,000 farmers who milk 420,000 cows. These creameries buy 1,500,000,000 pounds of milk every year and make 76,000,000 pounds of butter yearly, which is sold for \$18,000,000, of which amount \$13,000,000 is paid to the patrons. The creamery industry is a small part of the total dairy industry of the State. Half a million cows do not contribute to the creameries. The total dairy product of Minnesota is \$35,000,000 yearly.

Manufacturing.—There are in Minnesota 13,000 manufacturing establishments, employing

150,000 men and women. These establishments represent an invested capital aggregating \$190,000,000. The value of manufactured products is \$285,000,000 yearly. While Minnesota ranks 19th in population she ranks 13th in the value of her manufactures. The two great industries of the State are flour milling and lumbering. There are 600 flour mills, with an invested capital of \$30,000,000, paying \$3,000,000 annually in wages to employees, and producing annually a product worth \$88,000,000, more than any two other States combined. Minnesota ranks third in the manufacture of lumber, with 440 establishments, 28,000 employees, \$56,000,000 in capital, \$7,600,000 annually in wages paid, and an annual product of \$48,000,000. Minnesota also ranks third in the manufacture of linseed oil.

Education.—There are in the State 8,800 public school-houses valued at \$18,000,000. There are 415,000 pupils, and 13,000 teachers, who draw in salaries \$4,750,000 annually, an average salary of \$44.00 a month. There are 155 State high schools which draw special aid of \$2,000 yearly and 121 graded schools which draw \$800 a year in special aid. There are five normal schools (Winona, Mankato, St. Cloud, Moorhead, and Duluth), with a total enrolment of 2,600. The State University ranks third in point of enrolment among the universities of the country. The State Agricultural College ranks first among all the schools of this kind in America, and foreign governments send representatives to the Minnesota Agricultural School for special training. The total permanent school fund in 1903 was \$15,600,000. The State auditor says that in 1910 it will be \$35,000,000. The permanent university fund is \$1,500,000.

Penal and Charitable Institutions.—There are five insane hospitals, a school for the blind, a school for the deaf, a school for the feeble-minded, a State public school for dependent children, a State training school, a State reformatory and a State prison. These institutions are under the supervision of a State board of control. These institutions cover 5,400 acres of land, and the total value of their property is \$5,600,000. The annual gross expenditures for these institutions is \$1,200,000. The total number of inmates is 6,700, of which 4,000 are in the insane asylums; 90 in the school for the blind; 275 in the school for the deaf; 900 in the school for the feeble-minded; 260 in the school for dependent children; 400 in the State training school, 200 in the State reformatory and 600 in the State prison. The various State institutions produce annually \$125,000 worth of farm and garden produce for their own use and for sale. The feature of the State prison is the twine plant, which manufactures nine million pounds of twine yearly. This twine is sold to the farmers of Minnesota at cost, or about two cents under the market value of twine.

Railroads.—Thirty-three railway companies, inclusive of six terminal corporations, have trackage in Minnesota, the total mileage being 7,166. The total cost of construction to 30 June 1902 was \$283,444,660. For the fiscal year of 1902 the gross earnings within the State were \$51,868,191, and the operating expenses \$28,007,439. Upon the basis of gross earnings,

MINNESOTA.

DESIGN FOR NEW CAPITOL AT ST. PAUL.

MINNESOTA

the railroads paid into the State treasury, in taxation, in 1902, \$1,659,071. For the tax year of 1903 the gross earnings were \$66,193,731.99 and the taxation \$1,922,204.22.

Finances.—The total assessed valuation of Minnesota is \$780,000,000, the present rate of taxation is .23, the total bonded indebtedness of the State a little less than one million dollars. The payments from the State treasury last year amounted to \$7,500,000. In 1903 there were 288 State banks under the supervision of the State bank examiner. These banks have a capital stock of \$7,800,000 and deposits of \$22,000,000. There are 12 savings banks with a capital of \$200,000 and deposits of \$18,424,664. There are 8 trust companies with a capital of \$2,000,000 and deposits of \$2,395,073. There are 184 national banks in the State with a total capital stock of \$16,763,825.

Saint Paul is the capital. Under a territorial agreement by which that city became the seat of government, Minneapolis secured the university and Stillwater the State prison. The State is completing (1903) a handsome capitol which, with its parks and approaches, will cost approximately \$5,000,000. The reapportionment of 1901 gave Minnesota nine congressional districts and eleven votes in the electoral college. For legislative purposes, the State is divided into 63 senatorial districts, electing an equal number of senators, for four year terms, and 119 members of the house of representatives for two year terms.

Political.—Minnesota is recognized as an impregnable Republican State. But once since its organization has it chosen a Democratic governor, upon which occasion local issues controlled the result. The State gave 83,000 Republican majority in the last presidential election and in 1902 returned eight out of nine Republican members of Congress.

Bibliography.—Bryant, 'History of the Great Massacre by the Sioux Indians in Minnesota' (1863); Heard, 'History of the Sioux Wars' (1863); Flandrau, 'The History of Minnesota' (1900); Neill, 'The History of Minnesota' (1882); and the publications of exploration and travel by Radisson, Hennepin, Perrot, Charlevoix, Carver, Pike, Schoolcraft, Keating and Long, Beltrami, Featherstonhaugh, Nicollet, and many later writers.

H. T. BLACK,

Editor 'Saint Paul Dispatch.'

Minnesota, a river which has its rise in the northeastern part of South Dakota, flows through Big Stone Lake on the boundary between Minnesota and South Dakota, then flows southeast in Minnesota a distance of about 350 miles, to where it receives the waters of the Blue Earth, when it turns and flows northeast to the Mississippi River. It enters the Mississippi just south of Minneapolis and opposite Saint Paul. The head waters of the Minnesota and of the Red River of the North are but a short distance apart. The Minnesota is navigable to a rapids about 40 miles from its mouth, and for small vessels nearly 300 miles above the rapids. Its whole length is about 475 miles. It drains nearly all the southwestern part of Minnesota. North of the valley of this river are some of the great American forests, and south are the prairies.

Minnesota, The University of, a State institution at the head of the system of public education in Minnesota, located in Minneapolis, on the east bank of the Mississippi River. Its grounds comprise about 50 acres, and are so situated as to command a good view of the Falls of Saint Anthony and of the Mississippi River. The University Farm belonging to the State School of Agriculture contains 250 acres and is

MINNEWAUHOH — MINOR

three miles distant from the University. The charter of the University was granted by the territorial legislature 13 Feb. 1851, when the Territory contained less than 10,000 inhabitants. The State constitution, adopted 13 Oct. 1857, confirmed to the University all rights previously granted to it by the legislature. The institution was organized as a college in 1869, and opened 15 Sept. 1869, with a faculty of nine professors. William W. Folwell, LL.D., a graduate of Hobart College, was its first president and filled the office till 1884. Cyrus Northrop, LL.D., a graduate of Yale University and for 21 years a professor in Yale, was elected president in 1884.

The University consists of the following departments: (1) the College of Science, Literature and Arts; (2) the College of Engineering and Mechanic Arts; (3) the College of Agriculture; (4) the College of Law; (5) the College of Medicine and Surgery; (6) the College of Homeopathic Medicine and Surgery; (7) the College of Dentistry; (8) the College of Pharmacy; (9) the School of Mines; (10) the School of Chemistry; (11) the School of Agriculture; (12) the Graduate Department. The management of the University is vested in a board of 12 regents, of whom the governor of the State, the president of the University, and the State superintendent of public instruction are ex-officio members, and nine others are appointed by the governor and confirmed by the senate. The financial affairs of the University, except the salaries of instructors, are regulated by an act of the legislature passed in 1901, subject to the approval of the State Board of Control. The real estate, land and buildings of the University are valued at about \$2,000,000, and its invested fund is about \$1,400,000. The total attendance of students in 1903 was 3,788, of whom 1,179 were women. The number of professors and instructors in 1903 was 290. There are 18 buildings on the University campus, and 13 buildings on the farm with which the School of Agriculture and the experiment station are connected.

The University is supported by the State. Its fees required of students are nominal, except in the professional schools. One of the finest buildings on the campus is the gift of the late Ex-Governor John S. Pillsbury, who was for many years president of the board of regents, and to whose never-failing devotion the institution is largely indebted for its prosperity. The library contains 110,000 volumes. The requirements for admission are a full four years' course in a high school or its equivalent. Candidates for admission to the College of Medicine and Surgery are required to have completed, in addition to a high school course, one year in the University or some other reputable college — and after 1905 two years of college work will be required. A special six-years course has been provided by which both the degrees of B.A. and M.D. may be obtained — the first two years being in the College of Science, Literature and Arts with a select course of studies, and the last four years being the regular course in medicine.

CYRUS NORTHROP,
President University of Minnesota.

Minnewauhoh, mĭn-nĕ-wá'hŏn, N. Dak., village, county-seat of Benson County; on Minnewauhoh Lake; on the Great Northern railroad; about 115 miles northeast of Bismarck.

It has lumber-mills and a grain elevator. It has considerable trade in wheat and lumber. Pop. (1900) 432.

Minnewaukon, mĭn-nĕ-wá'kŏn, or **Devil's Lake**, in North Dakota, one of a group of salt lakes which have no apparent outlet. It is about 50 miles long and averages 15 miles in width; area, 750 square miles. The color of the water is darker than that of the fresh waters south. The water is too brackish to be used by men, but the wild animals of the surrounding region seem to like it. Several villages and trading posts are on its shores.

Minnow, a small fresh-water fish; originally a small European fish of the carp family (*Leuciscus phoxinus*). In the United States most of the minnows are of the same family (see CYPRINIDÆ), and are widely known as "shiners" on account of the silvery character of the scales. "The spring or breeding dress of the male is often very peculiar, the top of the head and often the fins and portions of the body are covered with small tubercles, outgrowths from the epidermis; the fins and lower parts of the body are often charged with bright pigment, the prevailing color of which is red, although in some genera it is satin-white, yellowish, or even black" — Jordan. These little fishes live in clear brooks for the most part, and go about in companies, which furnish food to larger fishes. Many of them afford good sport to young anglers; and all are sweet pan-fish, but very bony. They are of decided value, however, as live-bait. Most of the Eastern examples belong to the genus *Notropis*. See TOP-MINNOW.

Miño, me'ñŏ. See MINHO.

Minor, me'nŏr, **Jakob**, Austrian scholar: b. Vienna 15 April 1855. He was educated at Vienna and Berlin, and became professor of German language and literature at Prague (1884) and of Teutonic philology at Vienna. Besides numerous editions of texts, he published 'Neuhochdeutsche Metrik' (1893), an excellent study in prosody, and a valuable incomplete work on Schiller (2 vols. 1890).

Minor, mĭ'nŏr, **Robert Crannell**, American painter: b. New York 1840. He studied at Barbizon and became a pupil of Diaz there. He subsequently went to Antwerp and was taught by Van Luppen and Boulanger, making a specialty of landscape. His student travels led him through Germany and Italy, and on returning to New York he was elected to the National Academy of Design and the Society of American Artists. He has exhibited in the salons of Antwerp and Paris, in the Royal Academy of London, as well as in New York, Boston and Chicago. Among his best known works are: 'Dawn'; 'Sundown'; 'The Stream'; 'October Days'; 'Morning in June'; 'Sunrise on Lake Champlain'; 'Cradle of the Hudson'; and 'A Mountain Path.'

Minor, **Virginia Louisa**, American reformer: b. Groochland County, Va., 27 March 1824. She was educated at Charlottesville Academy (Va.), and in 1843 was married to a relative, Francis Minor, with whom she removed to St. Louis, Mo., in 1846. She was engaged in nursing the soldiers during the Civil War, and since the war has been connected with woman's suffrage movements. She was the originator of the movement in Missouri in 1866.

organized an association in 1867, and was president of the convention which met in St. Louis in 1869. In 1872 she brought the question of woman's suffrage as a right before the Supreme Court of the United States, where decision was rendered against her.

Minor, in law, a person under age of legal capacity, either for any or all acts. Sometimes, as in Scotland, the word is distinguished from the term infant by being more intensive, including those under age but above 14. Usually minor is synonymous with infant (q.v.).

Minorca, mī-nōr'kə (Sp. MENORCA, mā-nōr'kā), an island in the Mediterranean, belonging to Spain, the second largest of the Balearic group; greatest length, northwest to southeast, 35 miles; average breadth, about 10 miles; area, 260 square miles. It is situated northeast of Majorca, from which it is separated by a strait of 27 miles broad. The coast is much indented on all sides except the south, and generally presents a succession of bold headlands, enclosing small creeks and bays, of which several form good harbors. Of these the best and most frequented is Port Mahon, the capital of the island. The coasts are rugged, and the surface broken and mountainous. Mount El Toro in the centre attains a height of about 5,000 feet. The soil is not generally fertile; still, in good seasons the quantity of wheat and barley grown is sometimes equal to the consumption. The other principal products are oil, wine, hemp, flax, oranges, and lemons. Some good cheese is made, and considerable attention is paid to the rearing of bees. There is an abundance of small game on the island. Iron, copper, lead, marble, porphyry, and alabaster abound in several districts. The inhabitants make excellent sailors, but generally are indolent, ignorant, and bigoted. At an early period Minorca was under the Carthaginians, who drew from it a number of excellent slingers, who distinguished themselves during Hannibal's wars in Italy. It afterward passed successively into the hands of the Romans, the Vandals, and the Moors. The last were expelled in 1285 by the Spaniards. During the greater part of the 18th century it belonged to the British, who finally ceded it to Spain at the Peace of Amiens (1802). Its exchange with Great Britain for Gibraltar has been frequently discussed. Pop. (1900) 38,300.

Minorca, a breed of large black and white domestic fowls. See POULTRY.

Minority Representation. See REPRESENTATION.

Minos, mī'nōs, in Greek mythology, (1) a ruler of Crete, said to have been the son of Zeus and Europa. He was celebrated as a wise lawgiver and a strict lover of justice. (2) A grandson of the preceding, son of Lycastus, son of the elder Minos and of Ida. This second Minos was the husband of Pasiphaë, whose unnatural passion gave birth to the Minotaur. He was king of Crete, but is not represented as having succeeded to the kingdom, but by one tradition as having acquired it through the favor of the gods, and by another as having conquered it over his brother Sarpedon. He is said to have made war upon the Athenians to revenge the death of his son Androgeos, who was killed at the festival of the Panathenæa by the candidates whom he had defeated at the games. Mi-

nos having defeated the Athenians, exacted from them every year a tribute of seven youths and seven maidens, who were devoured by the Minotaur. Theseus delivered the Athenians from the burden of this tribute.

Minot, mī'nōt, **Charles Sedgwick**, American scientist: b. West Roxbury, Mass., 23 Dec. 1852. He was graduated from the Massachusetts Institute of Technology in 1872, studied also at Leipsic, Paris, Würzburg, and Harvard, was lecturer on embryology and instructor in oral pathology and surgery in the Harvard Medical School in 1880-3, instructor in histology and embryology in 1883-7, assistant professor in 1887-92, and professor from 1892. He invented two forms of the microtome, an instrument for the automatic preparation of sections for microscopical study. He was elected president of the American Society of Naturalists in 1894, and president of the biological section of the American Association for the Advancement of Science in 1901. Among his works are: 'Bibliography of Vertebrate Embryology' (1893); and 'A Laboratory Text-Book of Embryology' (1903).

Minotaur, mīn'ō-tār, in Grecian mythology the son of Pasiphaë and a bull, having the body of a man with the head of a bull, or the head of a man and the body of a bull. He ate human flesh, on which account Minos confined him in the labyrinth built by Dædalus, and at first exposed to him criminals, but afterward the youths and maidens yearly sent from Athens as a tribute, until at length Theseus killed him, and freed the Athenians from this tribute.

Minot's Ledge, or **Cohasset Rocks**, in Massachusetts, a promontory and lighthouse in Boston Harbor. See LIGHTHOUSE.

Minsk, Russia, a city and government of Lithuania, West Russia. Minsk, the city and capital of the government, is on the Svishloch, 420 miles by rail southwest of St. Petersburg. It is the see of a Greek archbishop and of a Roman Catholic bishop. It has some manufactures of woollen cloth, hats, leather, and a considerable general trade. Pop. (1897) 91,494.

The government, bounded on the north and east by Vilna, Vitebsk, and Moghilen; on the south and west by Chernigov, Kieff, Volhynia, and Grodno, has an area of 35,293 square miles. Pop. (1897) 2,156,123.

Min'ster (Anglo-Saxon, *Mynster*, from *monasterium*) anciently signified the church of a monastery or convent. In Germany and in Great Britain this title is given to several large cathedrals, as York Minster, the minster of Strasburg, etc. It is also found in the names of several places, which owe their origin or celebrity to a monastery, as Westminster, Leominster, etc.

Min'strel, a name introduced into England by the Normans, and which comprehended singers and performers of instrumental music, together with jugglers, dancers, sleight-of-hand performers, and other similar persons. See NEGRO MINSTRELS; TROUBADOURS.

Mint, a genus of perennial herbs (*Mentha*) of the order *Labiata*. About 30 species have been described, of which 12 are either native or naturalized in America, characterized by square stems, opposite simple leaves, small, purple, white or pink, two-lipped axillary

MINT

flowers, in whorls which often form terminal spikes. All are noted for the fragrance of their foliage, due to the presence of an essential oil, for the production of which half a dozen species are more or less cultivated. The following are the most important ones: Spearmint (*M. spicata* or *viridis*), peppermint (*M. piperita*), pennyroyal (*M. pulegium*), bergamot-mint (*M. citrata*), and Japanese mint (*M. arvensis*, var. *piperascens*). Spearmint is the species most used as a culinary herb in the form of mint sauce served mainly with roasted lamb. Peppermint is largely employed in flavoring candy and for the production of menthol. Bergamot-mint is chiefly used in perfumery. Medicinal properties have been attributed to all of them, and they have all been cultivated upon a commercial scale to supply the various demands. Besides these cultivated species, which are frequently found as escaped plants near gardens, there are several native species, of which the following are perhaps best known: Round-leaved mint (*M. rotundifolia*), which occurs rather interruptedly in the coast States from Maine to Texas; water mint (*M. aquatica*), with hairy stems, rather rare in wet places in New England and southward to Maryland; whorled mint (*M. sativa*) and its close relative, corn mint (*M. arvensis*), which are found in damp fields in New England; and wild mint (*M. canadensis*), which extends northward from the northern States across the continent. All are recognizable by their resemblance to other members of the genus, especially by their odor. Several other related plants of other genera are called mint, among them being mountain mint (*Pycnanthemum* spp.), also popularly known as basil. The numerous species are widely distributed throughout the United States and Canada, and have a mint-like flavor and odor. Catnip (*Nepeta cataria*) is often called cat mint, and several species of *Monarda*, especially *M. punctata*, are known as horse-mint.

The half-dozen cultivated mints are managed alike. They will grow on any soils that will produce good crops of potatoes, but since they are considered exhausting crops, are included in the rotation only once in five or more years. Upon reclaimed swamps, however, which are considered best adapted to their cultivation, they are generally allowed to remain consecutively for five years or even more without change of crop. The land having been plowed, harrowed and otherwise fitted, small pieces of the root-stocks are dropped at intervals of a few inches in shallow furrows about 30 inches apart. All through the season the land is kept scrupulously free from weeds, especially of smartweed, fireweed, ragweed and horseweed, which seriously injure the product if included in the "hay" from which the oil is distilled. Hand-weeding is commonly practised after horse cultivation is stopped by the luxuriant vines. About midsummer, or when the earliest flowers appear, the tops are cut, either with scythes or sometimes with mowing machines, and cured like hay. They are then stored under cover for distilling. This process is usually conducted with steam, which enters the still below, passes upward through the mass of hay, carrying the essential oil with it, and condenses in coils of pipe chilled by running water. After condensation, the oil and water separate by gravity. After standing for a greater or less length of

time, crystals of menthol (q.v.) appear in the oil of peppermint. The annual yield of oil per acre sometimes exceeds 50 pounds, and sometimes a second profitable cutting of the crop may be made in autumn. Having once been planted the crop takes care of itself from year to year. The most important producing centre is in southwestern Michigan and northwestern Indiana. Perhaps next is Wayne County, New York. Other important mint fields are at Mitcham, Surrey and Lincolnshire, England, and in Saxony, Germany.

Mint, a place where money is coined by public authority. In Great Britain there was formerly a mint in almost every county. Besides the sovereign, barons, bishops, and the principal monasteries exercised the right of coining. From the time of William the Conqueror the great bulk of the coining of Great Britain was done in London, but it was not till the reign of William III. that all the provincial mints were abolished. The present mint on Tower Hill, in London, was erected between the years 1810 and 1815. The London mint supplies the whole of the coinage of the British Empire, except Australia and the East Indies, which are supplied from branch mints at Sydney, Melbourne, Perth, Calcutta, and Bombay. In France the number of mints was at one time considerable, and in the earliest times indefinite. Before the Revolution there were 27 mints, each of which had a letter or letters of the alphabet for its sign. In 1857 there were still seven French mints, namely, Paris, Bordeaux, Lille, Lyons, Marseilles, Rouen, and Strasburg. In 1858 those of Lille, Marseilles, and Rouen were abolished, and in 1860 that of Lyons, so that there were only three mints remaining in 1870, when Strasburg was taken by the Germans.

In the United States there are mints at Philadelphia, established in 1792; at San Francisco, established in 1853; at Carson City, established in 1869 (operations at this mint have been discontinued since May 1893, and probably it will never be opened again, it is now conducted merely as an assay office); at Denver, established in 1862; and at New Orleans, established in 1835. (See COINAGE.) The Bureau of the Mint was established as a division of the Treasury Department in 1873. It has charge of the coinage for the government and makes assays of precious metals for private owners. The rolling machines are four in number. The rollers are adjustable and the space between them is governed by the operator. About 200 ingots are run through per hour on each pair of rollers. When the rolling is completed the strip is about six feet long. As it is impossible to roll perfectly true it is necessary to "draw" these strips, after being softened by annealing. The drawing benches resemble long tables, with a bench on either side, at one end of which is an iron box secured to the table. In this are fastened two perpendicular steel cylinders. These are the same distance apart that the thickness of the strip is required to be. It is drawn between the cylinders, which reduces the whole to an equal thickness. These strips are now taken to the cutting machines, each of which will cut 225 planchets per minute. The press now used consists of a vertical steel punch.

MINT GERANIUM — MIRA

From a strip worth \$1,100 about \$800 of planchets will be cut. These are then removed to the adjusting room, where they are adjusted. After inspection they are weighed on very accurate scales. If a planchet is too heavy, but near the weight, it is filed off at the edges; if too heavy for filing, it is thrown aside with the light ones to be re-melted. The planchets, after being adjusted, are taken to the coining and milling rooms, and are passed through the milling machine. The planchets are fed to this machine through an upright tube, and as they descend are caught on the edge of a revolving wheel and carried about a quarter of a revolution, during which the edge is compressed and forced up. By this apparatus 500 half-dimes can be milled in a minute; for large pieces the average is 120. The massive but delicate coining presses coin from 80 to 100 pieces a minute. These presses are attended by women and do their work in a perfect manner. After being stamped the coins are taken to the coiner's room. The light and heavy coins are kept separate in coining, and when delivered to the treasurer they are mixed in such proportions as to give him full weight in every delivery. By law, the deviation from the standard weight, in delivering to him, must not exceed three pennyweights in 1,000 double eagles.

Mint Geranium. See **COSTMARY**.

Minton, Thomas, English pottery manufacturer: b. Wyle Cop, Shrewsbury, 1765; d. 1836. He was originally an engraver having learned his art from John Turner, who had paid special attention to the process of printing on delft or chinaware. He settled at Stoke upon Trent in 1791 and founded a pottery factory with the object of producing glazed pottery in the highest style, which should compete with the productions of foreign countries. He was completely successful and the range of his manufacturers was increased by his son Herbert Minton, who succeeded him in 1836, and manufactured the famous "Parian" porcelain and the encaustic tiles, with which the name Minton is now most commonly associated.

Minuet, a French dance, in slow time, which requires great grace and dignity of carriage. It was the favorite dance in the time of Louis XIV. The name is also given to a piece of music written for such a dance in triple time.

Minuit, mīn'ū-īt, **Minuits**, or **Minneuit**, mīn'ē-wīt, **Peter**, German colonist in America: b. Wesel, Rhenish Prussia, about 1580; d. Fort Christina, New Sweden (Delaware), 1641. He was an official in America in the service first of the Dutch West India company and then of the Swedish West India company. Appointed governor of New Netherlands by the Dutch West India company on 19 Dec. 1625, he landed on Manhattan Island on 4 May 1626, purchased the island from the Indians for trinkets valued at approximately \$24, built Fort Amsterdam, and governed with a great degree of success until his recall in August 1631. In 1633 the charter of the Swedish West India company, originally granted in 1626, was renewed, and in 1637 Minuit, under the direction of the company, set sail from Gothenburg with 50 Swedish and Finnish colonists to found a colony in North America. He arrived at Dela-

ware Bay in April 1638, purchased from the Indians the territory between the falls of the Delaware at Trenton and Cape Henlopen, called this region New Sweden, and built Fort Christina. This colony was taken by the Dutch in 1655.

Minulúan, mē-noo-loo'ān, Philippines, a pueblo of Negros Occidental on Guimaras Strait, 5 miles north of Bacolod, the provincial capital. Pop. 11,340.

Minute, a division of time and of angular measure; the 60th part of an hour, and the 60th part of a degree. In astronomical works minutes of time are denoted by the initial letter *m*, and minutes of a degree or of angular space, by an acute accent (').

Minute Men, in the American Revolutionary War, the militia, who were prepared for service at a minute's notice. They were principally civilians, resident in Massachusetts, who were enrolled in accordance with an act of the Provincial Congress, passed 23 Nov. 1774. There were in Boston alone 16,000 minute men ready for service.

Minyas, mīn'ī-as, in Greek mythology, the son of Chryses, the hero of the *Minyar*, from whom were descended most of the Argonauts. His three daughters, Clymene, Iris, and Alcithoe, or Leuconoe, Leucippe, Alcithoe, were changed into bats for having made light of the mysteries of Dionysus.

Miocene Period, in geology, the middle period of the Tertiary era, intermediate between the older Eocene and the newer Pliocene. Considered in respect to its invertebrate (fossil) fauna the earlier part of it ("lower" Miocene) forms a part of the Oligocene (q.v.); but no such distinction can be made when the period is judged by its vertebrate remains. See **TERTIARY ERA**.

Miohippus, a fossil horse of later Miocene time. See **HORSE**, **EVOLUTION OF**.

Miquelon, mēk-lōn, an island in the Atlantic Ocean, near the southern coast of Newfoundland, at the entrance of Fortune Bay, with St. Pierre (q.v.) forming a French colony. The southern part of it is called Little Miquelon (*Petite Miquelon*) or **LANGLEY ISLAND**, and was once a separate island, but since 1783 has been connected with it by a sand-bank. The island has been in the possession of the French since 1763. It is under the direction of the commandant of St. Pierre and is occupied only by a few families engaged in the fisheries. The area of Miquelon is 83 square miles; pop. (1901) 550.

Mir, mēr, in Russia, a name given a commune, consisting of the inhabitants of one or more villages, who are as a community owners of the surrounding land.

Mira, mī'ra or mē'ra, or **Stella Mira** (the wonderful star), in astronomy, the star Omicron Ceti, a remarkable variable, situated in the neck of "the whale." Its variability was discovered in 1596 by Fabricius. The period is somewhat irregular, but averages about 331 days. During the greater part of this time the star remains of about the 9th magnitude, but during about 100 days it rises to a maximum which may vary from the 2d to the 5th magnitude, remains for a week or 10 days there, and then sinks to

MIRABEAU — MIRACLES

its minimum again. When shining with a brightness of the 2d magnitude, it is giving out more than 600 times as much light as when at the 9th magnitude.

Mirabeau, Gabriel Honoré Riquetti, gä-bré-él ö-nö-rä rê-kët-të më-rä-bö, or mir'ä-bö, COMTE DE, French orator and Revolutionary leader: b. Bignon, near Nemours, 9 March 1749; d. Paris 2 April 1791. About 1784 he began to devote himself to politics, visited London, was entrusted by Calonne with a secret mission to Prussia, and published various treatises, which made him sufficiently well known to the *tiers état* to be elected by the town of Aix to be its representative in the States-General of 1789. Here he speedily eclipsed all the other orators of the Assembly, and became the centre round which gathered all the men of greatest mark and force of character in the third estate. He was the immediate cause of the French Revolution, by the resistance which he offered to the demand of the king after the royal sitting of 23 June 1789, that the third estate should vote separately from the other two orders. It was on this occasion that he gave the vigorous reply to the grand-master of ceremonies, who had communicated to the Assembly the royal will, concluding with the words, "Go and tell your master that we are here by the will of the people, and that no one shall drive us out except by the force of bayonets." Both before and after this occasion he delivered many eloquent speeches, which obtained for him the title of the "French Demosthenes." Among the most remarkable of these are his address to the king demanding the removal of the troops encamped at Versailles, speeches on the national bankruptcy, on the civil constitution of the clergy, on the royal sanction, on the right of peace and war, and his reply to the Abbé Maury on ecclesiastical property. After having shown himself a bold reformer, and the most dangerous adversary of the court, Mirabeau ended by offering his support to the throne, although he continued to make a show of opposition to royalty in order to uphold his popularity. This state of matters dates from May 1790. It appears to be true that in this change of position he acted from conviction, foreseeing the imminence of a great catastrophe, which he desired if possible to avert. Whatever may have been his motives, this conduct, when it became known, naturally raised up against him numerous enemies. But on 30 November he was elected president of the Jacobin Club, and on 29 Jan. 1791 of the National Assembly. His remains were buried with great pomp in the Pantheon, but three years later they were exhumed to make room for those of Marat. The style of Mirabeau's eloquence was not exactly such as might have been expected from his fiery character. It was neither by bursts of passion nor passages of loud declamation that he was really distinguished on the tribune. While speaking he usually appeared unmoved and master of himself. He pronounced all his words so distinctly that he was never rapid, even when impetuous. Despising volubility, he was always grave, and sometimes even sententious in his manner. When once he had measured his subject, and brought it into prominence, all the powers of his mind were brought into play; bursts of eloquence shot forth in every sentence,

and his audience was completely carried along with him. Consult: 'Mémoires biographiques, littéraires et politiques de Mirabeau,' by his adopted son, Lucas de Montigny (1834-5); and 'Correspondance entre le Comte de Mirabeau et le Comte de la Marck pendant les années 1789-91' (1851). Other important works on Mirabeau are: Mérihou, 'Essai sur la Vie et les Ouvrages de Mirabeau' (1827); Reynald, 'Mirabeau et La Constituante' (1872); Louis and Charles de Loménie, 'Les Mirabeau' (1878 and 1889); Aulard, 'Mirabeau' (1882); A. Stern, 'Das Leben Mirabeaus' (1889; Fr. trans. 1895); Mézières, 'Vie de Mirabeau' (1892); Carlyle, 'French Revolution,' and 'Essays on Mirabeau'; Willert, 'Mirabeau' (1898).

Miracle Plays, a rude variety of drama, popular in the Middle Ages. The subjects were of a religious character, and the ecclesiastics were at first both the performers and the authors. Such plays were called "mysteries" and "miracle-plays," because they taught the mysterious doctrines of Christianity, and represented various celebrated miracles. A distinction is sometimes made between the two, in which case the miracle-plays are regarded as having for their proper subjects events connected with the lives of saints. The first play of this sort performed in England, and specified by name, appears to have been the miracle-play of Saint Catharine, written, according to Matthew Paris, by Geoffrey, a Norman, about 1110-19. They were originally written in Latin, but by the early 14th century we find them in English. They sometimes lasted several days. The Passion of Christ, the Slaughter of the Innocents, etc., are among the subjects represented, the first perhaps more frequently than any other. Such plays were often exhibited by the trade-guilds of the towns, the tanners, wrights, dyers, etc., giving each their own mystery in a special annual festival, such as Corpus Christi. Miracle-plays are still performed at various places in Roman Catholic countries. The passion-play, performed at the village of Ober-Ammergau, in Bavaria, every 10 years, attracts much attention. See DRAMA.

Miracles, works which excite wonder, because they are beyond ordinary human experience and appear to contravene the known laws of nature. The miracles of the Bible are called by various names, such as "wonders," "signs," "powers" and "works." They are wonders because of the effect upon the minds of those who witness them; signs, because of the testimony they bear to the character of those who perform them; powers, because of the exceptional power over nature which they exhibit; works, because of the work done on those who are their subject, such as the sick who are healed and the hungry who are fed.

The well-known argument of Hume against the credibility of a miracle has often been refuted. A miracle, he said, was contrary to experience, but false witnesses in history are not contrary to experience; it is less probable that the miracle is true than that the witness is false. There are two fallacies in this reasoning; it begs the question by the use of the words contrary to experience, for the point at issue is whether miracles are contrary to experience or no. If they are contrary to Mr. Hume's experience may it not be because his experience is

MIRAGE

limited? He has not lived at an age when a new religion was instituted, and extraordinary guarantees demanded in order to accredit it with a hostile world. Even mankind's experience in nature is becoming widened every year and many wonderful things take place at this moment which our ancestors of a century ago would have looked upon as magical or miraculous, such as the wireless telegraphy, communication, by telephone, the effects of the Roentgen rays, the power of radium, etc. For miracles are not to be looked upon as a violation of the laws of nature, but merely as the interposition of a higher law overruling a lower one. To those who believe in an intelligent creator and conservator of the world there can be no difficulty in apprehending the possibility of the miraculous; even those who like Herbert Spencer have a vague belief in what they style Force or Power underlying all the operations of nature, should not hesitate in admitting that the force which keeps up the multitudinous activities of the universe may manifest itself at times in unprecedented fashions, even as the new discoveries and combinations of science are constantly revealing new powers in the domain of natural law.

Pascal has said that the certainty and genuineness of certain miracles is proved by the falsity of others, meaning, presumably that the very fact that general human consent has been given to the idea of miracles proves that such idea has a counterpart in reality. There are of course certain concomitant circumstances which may be taken as affecting the credibility of a miracle. Most of the miracles of history may be put aside as inventions, such as many of the stories told by Livy and Herodotus, and the wild fables of Hindu history, as well as many miraculous incidents in the life of Mohammed. Christian apologists lay particular emphasis on the moral aspects of the miracle. To those who deny or doubt the existence of a supreme being, the moral ruler of the universe, a miracle is an impossibility. On the other hand, without miracles the revelation of God is impossible. Hence, a miracle with a moral object is most in accordance with the character of a Supreme Being governing the world with a moral end. All idle or superfluous miracles are to be rejected as at variance with the character of such a being. Equally to be rejected are miracles which are merely tentative, that is, sometimes successfully accomplished, sometimes ending in failure; as well as others which are doubtful in their nature, and those which are merely exaggerations of natural events.

In the early church those who defended Christianity against the attacks of those outside laid great stress on the evidence of miracles, and claimed that miraculous power still existed among Christians. Irenæus asserted that this power was universal among Christian churches. St. Augustine asserts the reality of the miraculous on the testimony of his own experience. He makes the acute remark that a miracle is not contrary to nature but to what we know of nature. The schoolmen did not agree with Augustine on this point. Thomas Aquinas defines a miracle as "something out of the order of nature." Albertus Magnus declares that God has implanted the possibility of miracles in the very nature of things, although denying that he can do anything contrary to nature. Luther

puts the miracle of grace in the heart far above any physical miracle, while he assigned the Bible miracles their proper place in the development of the faith. The Roman Catholic Church has always claimed the possession of miraculous powers and continues to do so to this day. The Socinians and Arminians maintain that God has always revealed himself by means of supernatural works, and Grotius in his defense of Christianity makes miracles the foundation of his argument. There has always, however, been a school of rationalists or philosophers who have opposed or attacked the belief in miracles, although Leibnitz admitted this belief into his philosophical system. He defines a miracle as an event inexplicable by natural causes. The laws of nature, he says, are not necessary and eternal; God can for his own purpose suspend them; the miraculous is included in the divine plan, and forms a part of "the pre-established harmony." Spinoza made the statement that miracles are impossible. In his pantheistic philosophy nature and her laws are identical with the will, intelligence and nature of God who cannot work contrary to the laws of material nature. Kant like the English Deists did not deny the possibility of miracles, for they might be wrought by powers and in accordance with laws of nature with which we are unacquainted, but believed that such laws were never exercised. Schleiermacher contests the apologetic value of miracles, and endeavors to eliminate the miraculous from the Christian scheme, which he thinks is lowered by this supernatural element. The modern agnostic claims that the advance of science has made a belief in the miraculous impossible. Some have tried to explain the recorded miracles of Scripture by a reference to natural causes; others would treat them as allegories or attribute them to self-deception, or fraud, or the credulous exaggeration of the bystanders and witnesses. But miracles form an essential part in Christianity, and cannot be either explained away or eliminated without destroying its authority. Consult: Duke of Argyll, 'Reign of Law' (1866); McCosh, 'The Supernatural in Relation to the Natural' (1862); Trench, 'Miracles of our Lord' (1884); Balfour, 'The Foundations of Belief' (1895); Pfeiderer, 'Philosophy and Development of Religion' (1894).

Mirage, mī-rāzh', the name given to certain illusory appearances due to the bending of rays of light in the atmosphere. The earliest attempt to explain the mirage seems to be that of Monge, who accompanied Bonaparte's Egyptian expedition; he thus describes what was observed by the French soldiers: "The villages seen in the distance appeared to be built upon an island in the midst of a lake. As the observer approached them the boundary of the apparent water retreated, and on nearing the village it disappeared, to reemerge for the next village"; he attributed the phenomenon to the hot sand of the desert keeping the lower layers of the atmosphere at a less density than the upper ones; the rays of light from the lower parts of the sky and objects in the distance arrive at the surface separating the less dense layer of air from those above, and are there subjected to total reflection; the eye sees the sky in the direction of the received rays, and this gives rise to the idea of a lake.

MIRAMAR—MIRROR

It is often assumed that rays of light pass through the atmosphere in straight lines; this is approximately true for short distances, but astronomers and surveyors have to correct their observations for refraction. By the laws of optics it is easy to see why a ray passing obliquely through the atmosphere, when this is arranged in horizontal layers of equal density (those of greater density being lowest), should bend; and that a vertical ray should not bend; but optics does not tell us why a horizontal ray is much more refracted than an oblique one. The explanation (first given by Dr. James Thomson) is easy on the undulatory theory of light. The wave front of a horizontal ray of light is at right angles to the ray, and is a vertical plane; now light is less rapidly propagated in the lower layers of air, hence the lower part of the wave front is retarded, and when the light has proceeded some distance its wave front is no longer vertical, and the ray has bent downward (the ray is always supposed to be normal to the wave front). Thus, in the atmosphere in its normal state the path of a ray of light is always slightly concave downward. Professor Everett thus explains the appearance of "castles, obelisks, and spires," cities with many buildings, forests of naked trees, and great basaltic precipices sometimes assumed by irregularities in cakes and fields of ice. It sometimes happens that several inverted images of an object are seen in the same sky; these may be accounted for by assuming that there are several layers of air, in each of which there is a rapid variation (an increase upward) of the index of refraction. Mirages are not uncommon in California, Nevada and Alaska.

Miramar, *mē-rā-mār'*, a celebrated palace on the shore of the Adriatic near Grignano, 6 miles from Trieste, the home of the Archduke Maximilian, afterward emperor of Mexico.

Miramichi, *mīr'a-mī-shē'*, Canada, a river of New Brunswick formed by the junction of the northwest and southwest Miramichi, about 35 miles above its mouth in Miramichi Bay on the Gulf of Saint Lawrence. The northwest affluent rises in the highlands east of the Nepisquit, and is about 90 miles long, 16 miles of which are influenced by the tides. The southwest or main headstream flows from a lake near the Tobique, and fed by numerous rivulets draining a lake district, becomes a considerable river 185 miles long to its confluence with the northwest branch. The Miramichi is navigable for large vessels two miles above Newcastle, the principal town on its banks. Salmon, trout and other varieties of fish abound in the river and its tributaries, and on one of the latter, Stewart's Brook, there is a government fish-breeding establishment.

Miramon, **Miguel**, *mē-gēl' mē-rā-mōn'*, Mexican soldier: b. City of Mexico 29 Sept. 1832; d. Querétaro 19 June 1867. He was educated in the military school of Chapultepec in 1846; was a volunteer in the war with the United States; became a colonel in the Mexican army; deserted with his regiment to take part in the revolt at Puebla in 1856; and for that was degraded when Puebla was taken by Comonfort. In October 1856 he headed another revolt at Puebla, in 1856-8 was conspicuous in the party of the reactionists, and was chosen by the

electoral junta to succeed Zuloaga as president 2 Jan. 1859 (entered office 2 February). He continued to take part in the "war of reform" in 1859-60, but was defeated at Calpulalpam, near Mexico, 22 Dec. 1860, by Ortega, and fled to the coast, sailed to Europe, and probably was concerned in the plans of Napoleon III. for an invasion of Mexico. Maximilian appointed him grand-marshal and minister to Berlin. Later, he was given a high command in the imperial army, and conducted with Maximilian the defense of Querétaro. He was captured on the surrender of the city, and shot with the emperor.

Miranda, *mē-rān'dā*, **Francisco Antonio Gabriel**, Venezuelan revolutionist: b. Caracas 9 June 1756; d. Cadiz, Spain, 14 July 1816. In 1773-82 he was an officer in the Spanish army, then served with the French allies in the colonies in the Revolutionary War (1779, 1781), and was a general of division in the French republican army (1790-3). He began a scheme for obtaining the independence of Spanish South America, founded the important society Gran Reunión Americana, which included many names later prominent in the South American revolution, and in 1806 made a futile attack on the Venezuelan coast. In 1810, on the breaking out of the revolution in Venezuela, he returned, in 1812 was made dictator, but on 25 July capitulated to the royalists. He was sent to Spain, and there remained a prisoner. Consult: Briggs, 'History of Don F. Miranda's Attempt to Effect a Revolution in South America' (1809); Baralt, 'Historia de Venezuela' (1841).

Miriam, the sister of Moses (q.v.) and the eldest of the family, is first mentioned as being stationed by her mother to watch her brother's cradle among the sedges on the river's brink. Later she procured her mother as nurse for the child when found by the princess. After crossing the Red Sea she is mentioned as "Miriam the Prophetess," and she takes the lead with Aaron in the complaint against Moses for his marriage with a Cushite. For this action she was stricken with leprosy, but later the curse was removed, and she died toward the close of the wandering in the desert. She was buried in Cadesh.

Mirror, a smooth surface usually of glass, capable of regularly reflecting rays of light. A mirror may be (1) a polished surface of glass; (2) a surface of tin-foil on the further side of a sheet of glass (as in the common looking-glass); (3) the surface of a deposited film of silver or platinum on a polished glass surface, so that rays of light to and from the metallic reflecting surface do not pass through the glass; (4) a polished surface of silver, gold, platinum, or speculum metal (a bronze composed of about 32 parts of copper to 15 of tin, small quantities of lead, antimony, and arsenic being sometimes added).

Looking-glasses date from the 12th century; they were a great improvement on the more ancient speculum metal mirrors, whose reflecting surfaces were liable to oxidation from exposure to the air, but they have the disadvantage that there are two reflecting surfaces, one of glass, the other of metal. Polished metals reflect nearly all rays of light at all incidences; glass reflects very few rays at the normal incidence,

but the amount of reflection becomes greater and greater as the incidence becomes more and more oblique. Mirrors are usually either "plane" or "spherical." Spherical mirrors are small portions of the surface of a sphere. In a spherical mirror, concave or convex, the line through the centre of the spherical surface of which the mirror is a part and the middle point of the mirror is called "the axis." From a concave mirror rays parallel to the axis converge after reflection to a point called the "principal focus," which is half-way between the centre of the sphere and the mirror. (See LIGHT.) Rays from a luminous object outside the spherical centre of a concave mirror form a small, real, inverted image of the object between the centre and the principal focus; when the object is between the centre and the principal focus the image is beyond the centre, and is large, real, and inverted.

Prior to 1835 mirrors were almost universally made by applying a coat of tin-foil amalgamated with mercury to the surface of plate-glass. In 1835 Baron Liebig observed that on heating aldehyde with an ammoniacal solution of nitrate of silver in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation the more recent process of silvering glass is really due. In 1849 Drayton made known a method in which he employed as a backing composition two ounces of nitrate of silver, one ounce of ammonia, three ounces of alcohol, and three ounces of water. The defects of these two modern processes are that the deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the old amalgam of tin and mercury; besides, the newer processes give the glass a slightly yellowish tinge. These disadvantages have been obviated by applying to the silver coating a weak solution of cyanide of mercury, which immediately forms a kind of amalgam, and renders the deposit at once much whiter and more adherent. The silvering is protected from mechanical abrasion and the chemical action of gases and vapors by a coating of shellac or copal varnish, which when dry may receive a further covering of red-lead paint. A method of coating glass with platinum has been recently introduced. A solution of bichloride of platinum is spread over the surface of the glass with a fine brush, and the metal is precipitated with oil of lavender. As this summary process produces a somewhat gray lustre it is used only for cheap mirrors, the lids of ornamental boxes, toys, and the like.

Mirror Carp. See CARP.

Mirror for Magistrates, The. This once popular work, the first part of which was published in 1555, and the last in 1620, was the result of the labors of at least 16 persons, the youngest of whom was not born when the oldest died. It probably owed its inception to George Ferrers, Master of the King's Revels at the close of the reign of Henry VIII.; and he associated with himself William Baldwin. Richard Nicolls is responsible for the book in its final state; and in the interim, it was contributed to by Thomas Newton, John Higgins, Thomas Blennerhasset, Thomas Chaloner, Thomas Sackville, Master Cavyll, Thomas Phaer, John Skelton, John Dolman, Francis Segar, Francis

Wingley, Thomas Churchyard, and Michael Drayton. It is a "true Chronicle Historie of the untimely falles of such unfortunate princes and men of note, as have happened since the first entrance of Brute into this Iland, until this our latter age." It was patterned after Lydgate's 'Fall of Princes,' a version of Boccaccio's poems on the calamities of illustrious men, which had been very popular in England. The stories are told in rhyme, each author taking upon himself the character of the "miserable person" represented, and speaking in the first person. The first one told by Ferrers is that of Robert Tresilian, chief justice of England.

Mirza, mēr'zā, Persian title, equivalent to "Prince."

Mirzapur, mēr-zā-poor', India, a city and district of the Benares division of the United Provinces of Agra. Mirzapur, signifying the Prince's Town, the capital of the district, is on the right bank of the Ganges, 56 miles by rail southeast of Allahabad. It presents an imposing appearance from the river, with fine ghats leading down to it, and numerous mosques, temples, and handsome European houses occupying some of the most conspicuous sites, but the interior is disappointing. It has the largest mart in Upper India for grain, cotton, and other raw produce, but with the railway era and the rise of Calcutta to commercial importance, much of its trade has migrated elsewhere. Shellac, brassware, and carpets are manufactured. There are imports of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt, and cotton; and exports of the same articles with manufactured lac-dye, shellac, and ghee butter. The military cantonment is three miles northeast of the town, on a peninsula formed by the windings of the Ganges. Pop. (1901) 79,787. The district has an area of 5,224 square miles, and a population (1901) of 1,082,706, chiefly Hindus. The chief products are wheat, barley, cotton, oil-seeds, and fruits.

Misamis, mē-sā'mis, Philippines, a province of the island of Mindanao, situated on the north central coast, bounded on the east by Surigao; area, 3,406 square miles, with dependent islands, 3,521 square miles. The province is crossed by two mountain ranges, one on the east side with summits of 5,000 feet elevation, and the other on the west side with a peak that rises 5,427 feet. It has a number of rivers, and is crossed by the Grande de Mindanao, or Pulangui, which rises in the northeast; Lake Lanao also extends over the southern boundary within its limits. The staple agricultural products are hemp, chocolate, coffee, cotton, sugar, rice, tobacco, corn, and sweet potatoes; the forests contain woods valuable for building as well as resinous trees. The chief industry is the manufacture of fabrics used for dress for home consumption and sacks for packing purposes. There are no good roads of any importance; the inland towns and villages are reached by river or trail, and the trade between coast towns is by native craft. Civil government was extended to the province in 1901; the population is mostly Visayan, with some Moros in the western part; the provincial governor reported in December, 1901, that the tranquillity of normal times was restored, with rarely some depredation from the Moros of Lake Lanao. Pop. 126,950.

Mischianza, mīs-kē-ān'tsā, The, in American history, an entertainment given in Phila-

delphia, 18 May 1778, during the War of the Revolution, by officers of the British army, in honor of Sir William Howe. The entertainment was given at the country home of Thomas Wharton and comprised a dinner, dancing, a regatta, mock tournaments and various games. Major André was prominent in planning the entertainment.

Misdemeanor, in law, any offense below felony; the least offense by English common law. In the United States, the different States vary widely in defining misdemeanor, so that what is misdemeanor in one State may be indictable felony in another. Among the offenses commonly classed under this heading are malicious mischief, assault and battery, etc.; criminal proceeding on such charges may be dropped, in many States, if the injured party acknowledge satisfaction, which suggests a distinction between felony. The historic line between the two classes of offenses was based on the outcome of conviction; in the case of felony the convicted person forfeited his property, real and personal, if the felony was capital, personal only if the felony was not capital. But no forfeiture of property ensued upon conviction for misdemeanor.

Miseno, mē-sā'nō, **Cape**, Italy, a promontory forming the west side of the Bay of Pozzuoli (ancient Cumæ), 10 miles southwest of Naples. On it are the ruins of the ancient city of Misenum, destroyed by the Saracens, 890 A.D., which Augustus made one of the principal naval stations of the Romans.

Miserere, mīz-ē-rē-rē (Latin, "have mercy"), the name by which the 50th psalm in the Vulgate (or Latin version) is known, corresponding to the 51st of the English version. The *Miserere* forms part of certain liturgies, and various great composers have taken it as a subject. The *Miserere* of Allegri is particularly famous.

Misericor'dia, or **Misericorde'**, a narrow-bladed Italian dagger used in giving the *coup de grâce* or finishing stroke to a wounded foe. Also the name of a society in Florence, founded in the 13th century, who tend the poor sick, carry victims of accidents or disease to the hospitals, and the dead to their burial.

Mishna, mīsh'nā, the first part or text of the Talmud, the second part or Gamara (supplement) consisting of a commentary on or elucidation of the Mishna, which consists of oral traditions and glosses on the Pentateuch, made in Galilee by the Rabbi Jehudah or Judah Hakko-desh, who completed the work 220 A.D. A commentary was rendered necessary by the extreme terseness and conciseness of style with which the Mishna is composed. It is written in Hebrew, but it contains a number of Greek, Latin, and Aramaic words, which had become naturalized in the Hebrew, and bears traces also of Aramaic idiom. The traditions set down in the Mishna were held by the Pharisees to be of equal authority with the written law of Moses, and were supposed to constitute an oral law delivered to Moses by God and by Moses delivered to Joshua, by Joshua to the elders, by the elders to the prophets, and by the prophets to the men of the Great Synagogue. Such is the statement of the Mishna itself, which the Pharisees accepted. The Sadducees, however, rejected this

doctrine, although in many cases they followed in practice "the traditions of the elders" with as much fidelity as the rival sect. See TALMUD.

Misiones, mē-sē-ō'nēs, Argentine Republic, a territory bounded on the north by Brazil, on the east by the rivers San Antonio and Pepiri or Pepiri-Guazu, separating it from Brazil, on the south by Brazil, and on the west by the province of Corrientes and Paraguay. Area, 11,282 square miles. Three low mountain chains radiate from the centre, and the greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs, and the *yerba maté*. Maize is largely grown and sugarcane to some extent, and several sugar-mills are in operation. Posadas, the capital, on the Parana was founded in 1805. The territory in 1900 had a population of 32,521.

Miskolcz, mīsh'kōlts, Hungary, capital of the comitat of Borsod, 24 miles northeast of Erlau. The inhabitants are chiefly employed in the cultivation of cereals and the vine, and there is an important trade in wine, corn, leather, stone, etc. Among the churches is a Gothic one of the 13th century, and it has also a fine hospital, several gymnasia and other educational institutions, and a theatre. Pop. (1900), 43,096.

Misrep'resenta'tion, in law, any act, whether verbal or tacit, tending to create or creating a false impression on another, such that by acting upon this impression he is injured. Misrepresentation falls under two heads, deliberate and unwitting. Deliberate misrepresentation is either deceit (q.v.) or fraud (q.v.). Unwitting misrepresentation is legal mistake (q.v.), and its treatment by the law depends largely on circumstances, but is unfortunately too much influenced by the principle that "ignorance does not excuse," which should strictly be confined to the application suggested by its original form, "ignorance of the law" (q.v.).

Mis'sal (Latin *missale*, from *missa*, mass), the book which contains the prayers, rubrics, antiphons, etc., of the mass. It was formed by comprising in one volume the separate books formerly used in different parts of the service, namely, the Oratorium, Lectionarium, Evangelarium, Antiphonarium, the Canon, etc., for the convenience of the priest. Variations and corruptions in the course of time crept into the text of the Missal, and the Council of Trent suggested a revision of it. This was accordingly accomplished by order of Pius V. (1570), who required the new Missal to be used by the whole church, with the exception of those societies which for more than two centuries had followed another ritual. Subsequent revisions made under Pope Clement VIII. (1604) and Urban VIII. (1634) extended little beyond alterations of single expressions, and the addition of new masses. In the ancient and mediæval church there were many varieties of Missal having only a local use. Thus, in England there were missals of the Sarum use, Hereford use, Lincoln use, Bangor use, etc. There are also missals of the Greek Church, the Church of the Maronites, and other Christian sects. The earliest printed missal is the 'Missale per totius Anni Circulum More Ambrosiano compositum' (Milan, 1475, folio), which was followed by the 'Missale secundum Consuetudinem Romanæ Curie' (Rome, 1475).

MISSION INDIANS — MISSIONS

Mission Indians, a general name given the Indians of southern California who in the 18th century were christianized by the Spanish Franciscan missionaries. The Mission Indians were originally of many tribal families and dialects, but chief among them were the Yumas and the Shoshones. Father Junipero Serra (q.v.) and the other friars who followed him succeeded in gathering the Indians into communities, mission houses and chapels were built and vineyards planted. The work began about 1776 and continued successfully until 1831. In this latter year they numbered 19,000, but with the overthrow of the Spanish power by the Mexicans a period of confiscation and destruction began, which continued to 1840. The friars were banished, the mission abandoned and the Indians driven back to the deserts and the mountains. Under the American rule in California, both Indians and missions were neglected until after the Civil War, when the government took steps to care for the unfortunate natives. They now occupy about 30 small reservations, which in the aggregate contain 180,000 acres. The remaining Indians number about 2,600. They are partly civilized and fairly industrious. Within recent years an organization in Los Angeles has been endeavoring to rebuild the ruined missions and preserve them in remembrance of a historic past.

Missionary Society, Methodist. See METHODIST EPISCOPAL CHURCH.

Missions, Protestant Foreign. Foreign missions were not seriously undertaken by Protestants until more than 200 years after the Reformation. This curious fact is sufficiently explained by the circumstance that the reformers were involved at the outset in a struggle, not only for liberty but for life itself; that Christendom did not yet control the whole of Europe; an aggressive Mohammedan power with its foot in Hungary and its fleets in the Mediterranean being still active in its purpose of conquest; and that the State alone commanded resources sufficient for enterprises of any kind in remote regions like the Indies, Africa, or America. These circumstances of life in Europe in the 16th century materially lessen the importance of the question whether Luther and his followers did or did not see that a Christian Church must die which is not actively missionary in principle.

The first Protestant missions, perhaps naturally, were state enterprises, unless we reckon as a mission the single effort of Heiling (1634) in Abyssinia, which ended with his murder 20 years later. In 1556 the Council of Geneva sent missionaries to Brazil with Coligny's colony, who perished with the colonists. In 1635 the Duke of Gotha sent a mission to Persia, and in 1663 again a mission to Abyssinia; both unpractical embassies were quickly forgotten. The Dutch Government, after gaining possession of the East-Indian archipelago in 1602, made a serious effort to Christianize the Malays, and the people of Ceylon and of Formosa, producing permanent results in Java and the adjacent islands of the East Indian Archipelago only. The Dutch Government published in 1685 the New Testament in Malay (the second of modern translations of Scripture into heathen languages; Eliot's translation into Mohican in 1663 having been

the first), and the whole Bible in 1701. It has also maintained a Malay Protestant Church in Java, the Moluccas and Celebes, which now has about 400 ministers and 250,000 adherents, of whom probably one half are descendants of the 17th century converts. A similar state missionary enterprise undertaken by a Protestant Government of Europe was the Danish mission to South India, founded by King Frederick IV. of Denmark in 1706. The king sent out as the first missionaries to Tranquebar, Ziegenbalg and Plutschau, Germans from Francke's school at Halle. Other Germans from the same surroundings followed, notably Schultze and his later associate Schwartz, making this Danish mission the first serious Protestant mission in India. Ziegenbalg translated the New Testament into Tamil (the third of modern translations of Scripture into heathen language), and before the end of the century from 30,000 to 50,000 Tamils had become Christians.

Another mission maintained by Frederick IV. of Denmark was that commenced by Hans Egede in Greenland in 1721, and later transferred to the care of the Danish Missionary Society. This mission Christianized the whole Eskimo population in the vicinity of the Danish trading stations.

The British Government showed a similar sense of responsibility for missionary work in its colonies, and the duty of preaching to the North American Indians was laid down in the charters of Virginia (1584) and Massachusetts (1628). Parliament even went so far as to consider in 1648 the endowment of a state foreign missionary enterprise. It voted a grant in aid of the "Society for the Propagation of the Gospel in New England," formed in 1649 and still existing under the name of the New England Company, which educates Indians in Canada with the revenues of the ancient government grant. John Eliot of Roxbury, Thomas Mayhew of Martha's Vineyard, and others through this government solicitude received state support in their missionary work for Indians. The British East India Company, moreover, was required by its charter in 1698 to maintain chaplains at its stations, and to instruct its Hindu servants in Christian doctrine.

All of these state enterprises in the line of foreign Protestant missions were uncertain in method and precarious in stability. They served, at least, to show the possibility of prosecuting missions in the colonies, and were sufficiently barren to suggest the formation of those voluntary societies for missionary effort which proved to be the effective form in which the missionary idea among Protestants was to express itself.

Unsatisfactory religious conditions in the East India Company's trading posts led in 1698 to the organization of the "Society for the Promotion of Christian Knowledge," with the purpose of providing books and schools for neglected English communities, and in 1701 to the appearance of the "Society for the Propagation of the Gospel in Foreign Parts," intended to provide for the religious culture of Englishmen residing in foreign lands. Both of these societies were directed by the Church of England, although voluntary in form and in the sources of their revenues. Neither of them were Foreign Missionary Societies. But the first now publishes books in Oriental languages, and it saved the Danish Mission in South India from

MISSIONS

dying with its royal founder, and supported it during a century, until it was taken over by the Society for the Propagation of the Gospel. This latter Society, too, has gradually taken up the work of evangelizing pagans until now (1903) it has 509 missionaries in India, China, Japan, Malaysia, Africa, and the West Indies, with nearly 3,500 native clergy and laymen in the various departments of its work. These two societies then, founded about the beginning of the 18th century, may be considered as the pioneers of the voluntary foreign missionary societies of Protestant Christendom.

It was not until the 19th century was about to dawn, however, that a general movement toward Missionary enterprises began among Protestants in Europe and America. This movement grew out of that revival of personal religion in the 18th century which was fostered by the writings of Spener and Francke, the Pietists of Halle, and by the devoted lives of men like David Brainerd of Connecticut, and Zinzendorf, the patron and leader of the Moravians, and was stimulated by the exhortations of Whitefield, the Wesleys, and Jonathan Edwards, and by the example of the "Unity of Brethren" (*Unitas Fratrum* or *Brüder Unität*) as the Moravians call themselves. The Moravians, not as a church that begs men to volunteer, but as a community in which every member has equal interest in the missionary idea, were the first decided champions of Protestant Missions. They held it the duty of all Christians to tell men what benefits they have received from Jesus Christ. They established missions between 1732 and 1770 in the West Indies, in Greenland, in the Indian settlements of North America, among the Hottentots of South Africa, and in Labrador. They now (1903) support about 300 missionaries and 1,800 native preachers and teachers in their various mission fields which include, besides those already named, Alaska, Australia, and the border lands of Tibet. The English Wesleys should also be reckoned with the Moravians as having taken up missions in advance of the general movement of the Protestant churches. They did not formally organize the Wesleyan Methodist Missionary Society until 1814. But in 1779 they employed missionaries among the North American Indians, and in 1786 they began an important work among the slaves of the West Indies. The Society now has 280 missionaries, and 3,634 native workers and teachers in India, Ceylon, South Africa, China, Polynesia and the West Indies.

Before this extension of Wesleyan Missions took place a surprising outburst of zeal for the missionary idea appeared almost simultaneously in England, in the United States and on the continent of Europe. It was a revolution, since formalism had made the Protestant churches almost forget that to be a Christian means to be always in some sense a missionary. The characteristic feature of the movement was its origin in the conscientious convictions of isolated individuals, from whom the Church did not expect initiative and whom it sometimes regarded as unsteady enthusiasts. William Carey, a cobbler and a Baptist minister in England, made the first move in 1786 and was frowned down by his elders. But in 1792 his earnest conviction carried the day; twelve men united to form the Baptist Missionary Society (England), and Carey and Thomas went to India as its first

missionaries. There is no space here to describe the marvelous activities of Carey and his associates Marshman, Ward, and others, at the Danish trading post of Serampur near Calcutta, where they were given asylum when the East India Company refused to tolerate their presence in its territories. The great school buildings which these missionaries erected at Serampore stand to-day, and their press added to the then slender stock of Bible translations, passably good versions of Scripture in 34 Oriental languages and dialects. The Baptist Missionary Society has (1903) 252 missionaries and 2,073 native preachers and teachers in India, Ceylon, China, Africa, and the West Indies.

This example was contagious. In 1795 "The Missionary Society" was formed in London by the union of notable men of four different denominations. Its name was afterward changed to "The London Missionary Society." It is now substantially composed of Independents (Congregationalists) alone, and has (1903) 275 missionaries and 6,462 native preachers and teachers, in Polynesia, New Guinea, Madagascar, Africa, India, and China. In 1796 two similar societies were formed in Scotland which at first aided the London Society, but later took up independent work in the West Indies and in South Africa, and finally (1824) became merged in the Church of Scotland Foreign Missionary Committee, of which a later (1843) offshoot was what has now become the Foreign Missionary Society of the United Free Church of Scotland. The Church of Scotland Foreign Missionary Committee now (1903) has 143 missionaries and 467 native workers, and the United Free Church has 409 missionaries and 2,649 native preachers and teachers in India, China, Africa, Arabia, the New Hebrides, Manchuria, and the West Indies. The same impulse led in 1797 to the formation in Holland of the Netherlands Missionary Society. This was first an auxiliary of the London Missionary Society but soon undertook independent work. In 1903 it had 24 missionaries and 62 native workers in the Dutch East Indies.

The same conviction of responsibility together with realization of the extent and condition of the heathen world led in 1797 to the organization in London of 26 men belonging to the Church of England as the "Society for Missions to Africa and the East." This name later gave place to the familiar one of the "Church Missionary Society." Among its founders were William Wilberforce, Henry Venn and Charles Simeon; but the Church of England gave the Society no encouragement until the successes of nearly 50 years compelled recognition. Hence the first missionaries of this Society were commonly Germans; for the most part men of the highest ability and attainments. The fields of the Church Missionary Society are India, Ceylon, China, Japan, Africa, Mauritius, New Zealand, Persia, Palestine, Egypt, the Sudan and the Arctic regions of British North America. It now (1903) has 1,330 missionaries and 8,076 native preachers and teachers.

Missionary enterprises next began to spring up in Germany and in America. The marked characteristic of the movement in every case was the same profound conviction of individuals, commonly not officials of the churches to which they belonged. Three students of Williams College in Massachusetts furnished the initiative that resulted in the organization of the "Amer-

MISSIONS

ican Board of Commissioners for Foreign Missions" in 1810. This was at first an interdenominational Society. Its first missionaries, Newell, Judson, Hall, Rice, and Nott, were sent to India and were ordered out of the country by the East India Company the moment they landed. Judson and Rice took refuge with the English Baptists at Serampur, while the others succeeded in effecting a lodgment at Bombay and in Ceylon. The fields of this Society in 1903 were India, China, Japan, Ceylon, Africa, Turkey, and Micronesia, and it had 544 missionaries and 3,581 native preachers and teachers. After 40 years of existence as an interdenominational Society, it handed over its missions in Persia, Syria, and the Gabun region of West Africa to the Presbyterians, and part of its field in South India to the American Reformed (Dutch) Church, and has become substantially a Congregationalist body. Judson and Rice of the earliest missionaries of this Society decided on arriving in India that they would prefer to serve under a Baptist organization and this decision led to the formation in 1814 of what is now the "American Baptist Missionary Union" of Boston. Burma was the field selected for its first efforts and the heroic work of Adoniram Judson in that land made his name great among modern Protestant missionaries. The "A. B. M. U." had 505 missionaries in 1903 and 3,595 native workers in Burma, Siam, Assam, India, China, Japan, and Africa.

Meantime, in Germany, Jannicke of Berlin, whose brother was a missionary of the "Danish Halle" band in South India, opened a Missionary Training School at Berlin in 1800. This school during the next 25 years furnished about 80 missionaries to the service of the English and Dutch Societies, and served to arouse interest in Missions among the Germans. Its influence led in 1815 to the establishment of a Missionary Training Institute at Basel in German Switzerland. The latter institute furnished many admirable men to the service of other societies and in 1822 began to send out missionaries of its own. The fields of the Basel Missionary Society are in India, China, and Africa, and graduates of its Institute are pastors of Protestant churches in Turkey. It now (1903) has in the field 333 missionaries and 1,266 native workers.

In 1824, 10 strong men in the Lutheran Church, among whom were Neander and Tholuck, formed the Berlin Missionary Society; beginning operations, according to the wise continental practice, by opening a Training School for missionaries. It began to send out missionaries in 1834 and now carries on missions in Africa and China. Its working force in the field in 1903 consisted of 138 missionaries (wives of missionaries not counted) and 924 native preachers and teachers. Other Missionary Societies sprang up in Germany during the first quarter of the 19th century, at first as auxiliaries to existing boards. Several of them, like the Gossner Society, the Hermannsburg, the Rhenish, the Leipzig, the North German, and the Breklum Society developed into independent existence, and these together had 510 missionaries in 1903 with 3,092 native preachers and teachers in the Dutch East Indies, Africa, India, China, and Australia.

The same period saw the formation in France of the Paris Evangelical Missionary Society

(1824), designed at first merely to aid existing enterprises, but quickly beginning to send out missionaries of its own. In 1903 it had 134 missionaries, men and women, and 997 native workers, in Senegambia and the Barotse and Basuto regions of Africa. With the development of French colonial expansion it has also taken the place of the London Missionary Society's missionaries in Tahiti and in parts of Madagascar, and of American missionaries in the French Kongo region. Protestant missionary societies in Denmark, Sweden, Norway, and Finland sprang later from the same causes and are doing good work in Africa, India, China, Chinese Turkestan, and Madagascar.

The same spiritual awakening of widespread effects gave rise also to the British and Foreign Bible Society (1804), the American Bible Society (1816), the Netherlands Bible Society, the Religious Tract Society of London (1799), and the American Tract Society of New York (1820). The Bible Societies do true foreign missionary work in publishing the Scriptures as soon as missionaries have translated them into the languages of non-Christian peoples, and in disseminating the Scriptures in these languages. Some 400 modern translations have been published. The British and Foreign Bible Society in 1903 had 23 agents employed in non-Christian lands with 1,366 native colporteurs and Bible women, and its total issues (at home and abroad) of Bibles, New Testaments and lesser parts of Scripture amounted to 5,067,421 copies. The American Bible Society has 13 agents, 477 native colporteurs in mission fields, and issued in 1902 some 1,993,558 copies. The Scottish National Bible Society issued in the same year 692,603 copies, besides joining with the first named Societies in providing finances for translating and publishing the Bible in various languages.

The Tract Societies aid missions in a similar manner; providing funds for the publication of undenominational Christian literature in the languages of non-Christian peoples. The Religious Tract Society of London at its Centennial Anniversary was able to report that it had given for this purpose to English and American Foreign Missions aid equivalent to \$100 per day during the whole period of its existence.

In the second quarter of the 19th century the American Methodist Episcopal Church and the American Presbyterian Church began their missionary work in foreign lands. Almost all denominations in the United States and in Great Britain now have Foreign Missionary organizations of their own, and since the middle of the century the British colonies in Canada, India, Australia, South Africa, New Zealand and the West Indies, and to some extent the Dutch colony in Java, have begun foreign mission enterprises of their own. Interdenominational and international Missionary Societies, like the China Inland Mission, the North Africa Mission, the Christian and Missionary Alliance and other bodies of greater or less importance have been formed to carry on missionary enterprises by methods more free from machinery than the older Societies sometimes seem to require. The total number of Protestant Missionary Societies now existing is difficult to ascertain with accuracy. It probably exceeds 500. According to Beach ("Geography and Atlas of Foreign Missions") (1902), these Societies employed 16,613

MISSIONS

missionaries of both sexes and 75,281 assistants who are native in the regions where they work.

Three points are especially noteworthy, in the history of the development of these Missionary Societies, as each marking an epoch of expansion in the scope of Protestant Missions. These are: (1) The adoption of education as a missionary agency; (2) The general adoption by women of mission work for womankind; (3) The establishment of medical missions.

1. *Education.*—The aim of Foreign Missions is to tell of Jesus Christ to those who do not know Him. The aim is to lead them to surrender self-will to the control of Jesus Christ so completely that converts shall be true Christians, who, if the missionary leaves to-morrow, will stand immovable in their devotion and their impulse to teach others the truth that has benefited themselves. At the outset the task seemed simple enough. To preach and preach again was all that was necessary. As a result of the first half century of experience, the discovery was made that common schools are essential in all missions which urge the reading of the Bible. Rev. Dr. Alexander Duff, a missionary from Scotland who has left ineffaceable marks upon India, was a leader in championing the thesis that education in all grades is also a legitimate and essential department of missionary effort. This principle is now established with all that it means of general enlightenment for backward races, and in 1903 there were in the Protestant missions throughout the world nearly 25,000 educational establishments of all grades from kindergarten to university, attended by about 1,200,000 young people of every form of religious belief.

2. *Woman's Work.*—As early as 1825 missionaries undertook the education of girls in India, Africa, Turkey and elsewhere. In 1835 a Woman's Missionary Society was formed at Berlin, Germany, for the instruction of women in the East; and later schools for girls were opened in several non-Christian lands by different missionary societies. It was not until 1860 that the women of Christian lands began to take the matter into their own hands. Beginning with the Woman's Union Missionary Society of New York (1860), mission boards of women were organized in almost all the Protestant denominations of Great Britain, Canada, and the United States. These missionary societies of women are for the most part closely allied to the general missionary boards of the denominations to which they belong, but they send out women as missionaries and have produced another vast extension of the scope of the missionary enterprise. The impossibility of carrying on successful missions without women missionaries to win and instruct their own sex is

now fully recognized. There were in 1903 about 3,500 unmarried women working as missionaries in all parts of the non-Christian world. No mission field is so dangerous or so repellent in its barbarism as to be denied the ministering service of devoted women of Christendom.

3. *Medical Missions.*—The science of missions has grown out of experience. At the outset physicians were sent to the missions with the primary duty of caring for the health of missionaries. They could not, however, fail to use their knowledge for the relief of suffering in lands where surgery was unknown and the art of medicine parodied by natives. In 1841 the "Edinburgh Medical Missionary Society" was formed to increase the number of such physicians. It was not until about 1885 that the Medical Mission was fairly established as a recognized channel of missionary influence. Since that time the number of missionary physicians, both men and women, and of missionary hospitals and dispensaries has increased every year. Beach in his 'Atlas of Protestant Missions' (1902) gives 898 as the number of such hospitals and dispensaries in Asia, Africa, and Oceania, and the number of patients who receive treatment each year is more than 2,500,000. The enormous broadening of the influence of Foreign Missions need not be emphasized which results from their entering upon the training of children, the enlightenment of women in the seclusion of the home, and the healing of the sick who without this ministrations would suffer and die.

Results of Foreign Missions.—Nothing like full statistical tables of these numerous missionary societies would be possible were it not that more and more the various denominations regard all missionary enterprises as essentially one. Fifty years ago the missionaries of different denominations in India began a practice of holding conferences together to plan for the more effective prosecution of the common work. Such conferences of missionaries are now held regularly in India, China and Japan. More than this, the missionary societies of Europe and America have adopted the same plan. General conferences of the societies have been held with great mutual advantage, the most notable of these being the Conference of London in 1888 and the Ecumenical Conference of New York in 1900. The German missionary societies confer together each year, and so do the secretaries of the British societies. So do those of some 40 societies in the United States and Canada. The result is steady advance toward a more economical management of all missions, marked diminution of possible friction between different denominations, and a fuller knowledge of the work that each denominational society is undertaking. The following statistics, which aim to cover the

	Communicants	Professed Christians including children of converts	Missionaries (men and women)	Native workers (men and women)	Places of worship	Schools of all grades	Hospitals and dispensaries

MISSIONS

work in non-Christian lands of all missionary societies, are compiled in the main from Beach's 'Atlas' (1902) with some later additions.

Figures are proverbially uncertain agents for setting forth facts. In the statistical tables of missions the enormous areas from which they have to be gathered ensure that before they can be collated and put in print they are already stale. Leaving this out of account there remains the need to caution in deductions based on mere figures. 'The enthusiast may forget, on seeing the number of converts recorded, that there is no miraculous short cut by which the pagan savage may be transmuted into a gentleman of ethical and intellectual perfection. In any groups of people instructed and changed through missionary effort the majority are and will long remain infants in growth. As in Christian so in non-Christian lands a minority only grow so far as to do things that give them weight in valuations of the community. On the other hand, doubters may easily put too low a value upon such figures and rate these converts as worthless because they are mere fallible human beings. Events have tested converts from paganism in India, Africa, China, and in fact in all mission fields, with the result of showing that sincerity, unselfishness, and stability exist among them. Men from the lowest have risen to the highest ability, like the slave-boy Crowther of Yorubaland, and Constantian of Turkey whose Hebrew and Greek scholarship made them notable among Bible translators; or like Abdul Masih and Imaduddin of India, converted Mohammedans whose work in the Christian ministry proved them masters of Christian apologetics; or like Dr. Saleeby of the Philippine Islands, the assistant commissioner for dealing with the Moros of Sulu, whose origin was in an obscure village of Mt. Lebanon in Turkey, and whose qualifications for his high office were gained in the American Missionary schools of Syria. Men and women of humble surroundings in all the non-Christian lands have been transformed from superstitious and morally degraded barbarians into useful members of the race, of a purity of life that would be noteworthy in the most favored lands. And their influence is great in accord with this fact. The increase of the population of British India in the decade 1891-1901 was about seven per cent, while the increase of the number of Christians in India during the same period was about 30 per cent. In Uganda in central Africa the number of converts baptized by the missionaries of the Church Missionary Society in 1902 was about 4,000. In both of these cases all testimony agrees in showing that the increase is largely the result of the influence of the pure lives and the active and earnest convictions of natives previously converted. Of the 100,000 converts added in 1902 to the communion of Protestant missions in all parts of the world it is probable that more than half were led to Christianity in the same way. Such examples tend to show that the influence of missions is cumulative upon the people among whom they are established, and in this case the figures of statistical tables have a weight which may be easily underestimated.

Much might be added in respect to the effect of missions in extirpating degrading, immoral, and cruel customs, like cannibalism, or widow-burning, or human sacrifice and in elevating the standing of womankind everywhere, and in

endowing illiterate languages with alphabets and the beginnings of a literature, and in teaching peoples to be producers who have been mere parasites, living by the sword on the industry of others. Much might be added on the indirect influence of missions in adding great areas, as in the islands of the Pacific, and in Africa to the fields of the world's commerce and in producing a general moral and intellectual uplift as in India and China of peoples who have not accepted the religious message of the missionary. The aim of foreign missionary enterprise is so beneficent and its agencies so thoroughly devoted to the aim; it is conducted on so broad a view of the scope of its purpose; its methods have been so perfected by experience and conference, and it so surely penetrates to the deepest sources of social evolution among the masses with whom is the reserve vitality of every nation, that it must be taken into account in reckoning up the agencies by which Europe and America are shaping the destinies of the great and mysterious East.

Bibliography.—For statistics and history: Warneck, 'History of Protestant Missions' (1901); Dennis, 'Centennial Survey of Foreign Missions' (1902); Beach, 'Geography and Atlas of Protestant Missions' (1901-3); 'Encyclopædia of Missions' (1904). For Sociological relations of Missions and the methods in use: Dennis, 'Christian Missions and Social Progress' (1897-9); 'Report of Ecumenical Missionary Conference' (1900); 'Report of the Centenary Conference on Foreign Missions' (1888). For views of separate missions and different countries, the volume of books is so great as to make selection almost invidious. A few good recent works are: (for India) Jones, 'India's Problem' (1903); (for Siam) Curtis, 'The Laos of North Siam' (1903); (for Turkey) Dwight, 'Constantinople and its Problems' (1901); (for the Philippines) Brown, 'The New Era in the Philippines' (1903); (for Africa) Stewart, 'Dawn in the Dark Continent' (1903). Histories of the larger Missionary Societies also contain a mass of valuable information respecting the mission fields: 'History of the Church Missionary Society' (1899); 'History of the London Missionary Society' (1898); 'Two Hundred Years of the S. P. G.' (1901).

HENRY OTIS DWIGHT,
Bureau of Missions, New York.

Missions, Protestant Home. Home missionary effort in the United States is older than its organized form. Before the War of the Revolution individual churches in New England and New York were sending their pastors, for weeks or months at a time, into the new settlements, to preach the Gospel and administer the ordinances of religion. Connecticut pastors received for this service \$4 a week, and \$4 more were allowed for the supply of their pulpits, the money being raised by voluntary subscriptions among the home churches. These desultory efforts continued more or less intermittently for 25 years: they were warmly welcomed by the struggling settlements and were influential in preparing the way for better organized endeavors.

Organized American home missions began with the establishment of the "Missionary Society of Connecticut," 21 June 1798, by the Congregational churches of that State. Massa-

MISSIONS

chusetts Congregationalists followed one year later, 1799, with the "Massachusetts Missionary Society." Both of these Societies, bearing the names of the States where they originated, and supported by the States whose names they bear, were not primarily for the benefit of Connecticut and Massachusetts. The object of the Connecticut Society, as stated in its charter, was "to Christianize the heathen (Indians) of North America and to support and promote Christian Knowledge in the New Settlements of the United States." The charter of the Massachusetts Society describes its object as being "to diffuse the Gospel among the heathen (Indians) as well as other peoples in the remote parts of our country." Both Societies, therefore, while local in their origin and support, were truly national in spirit and aim. Other New England States followed the lead of Connecticut and Massachusetts in organizing similar societies; New Hampshire in 1801; Rhode Island in 1803; Maine and Vermont in 1807, all of them under Congregational auspices. They all continue to the present time with but slight changes in name, and with increasing devotion to home missions, State and National. The first organized movement on the part of the Baptist churches was made in 1802, when the "Massachusetts Domestic Missionary Society" was established at Boston, with the same broad object as its Congregational predecessors, namely: "to furnish occasional preaching and to promote the knowledge of evangelistic truth in the new settlements of these United States, or further, if circumstances should render it proper." To the same year 1802, belongs the first systematic effort of the Presbyterians of New York, Pennsylvania, and New Jersey, acting under the same broad charter with those of the Congregationalists and Baptists of New England; "to send forth missionaries well qualified to be employed in mission work on the frontiers, for the purpose of organizing churches, administering ordinances, ordaining elders, collecting information concerning the state of religion in those parts, and preparing the best means of establishing a Gospel ministry among the people." Meanwhile the Reformed Church of America had not been idle. Sporadic missionary work began with it as early as 1786, culminating in 1822 in the organization of the "Missionary Society of the Reformed Dutch Church," differing nothing in spirit from its forerunners, but with a wider scope, as it included home and foreign missions under a single organization. Methodist and Episcopal missions, as well as the Lutheran and those of the Disciples of Christ, belong necessarily to a later period.

It is important, historically, to remember that all these early missionary bodies were called into being by one motive and for one object. Barbarism in the new settlements was the common dread of the East, and to prevent such a disaster by pre-empting those rapidly gathering communities with religious institutions was the motive of all early home missionary organizations. At the opening of the 19th century, what was known as the new settlements were found mainly in northern New England, eastern and central New York and northern and southern Ohio, and these were the first points of home missionary attack. The opening of the Northwest Territory and the passage of the Ordinance of 1787 attracted a stream of emigration

from the East, mingling with which was a considerable element from Great Britain, Holland, Scandinavia, Germany and Moravia, Belgium and Switzerland. The earlier settlers in New York, Ohio, Indiana and Illinois were generally Protestant in their sympathies, but unable at once, with a new country to subdue and new homes to be built, to provide themselves with the institutions of worship. To the help of these hopeful but destitute settlers came the missionary organizations of the East. Their missionaries were hurried forward to every needy point, not only in the wilds of New York and Ohio, but to the remoter settlements of Indiana, Illinois, Kentucky and Tennessee. They even found their way down the Mississippi to New Orleans and crossed the northern borders to Canada. A specially promising field of effort was a section of Ohio, bordering on Lake Erie, settled chiefly by emigrants from Connecticut and for this reason commonly known as "New Connecticut." At the beginning of the century the tract contained about 1,400 inhabitants. In 1804, it had 400 families; one year later the 400 had become 1,100, one half of them from New England. In less than thirty years from the beginning of organized home missions 90 churches had been planted, all of them by home missionaries sent out and supported by Connecticut and Massachusetts. To sum up in a sentence the work of the Missionary Society of Connecticut at the end of 30 years, 200 missionaries had been employed whose joint labors were equivalent to 500 years of ordinary service by one man, and 400 churches had been established in the new settlements of the land. With what wear and tear of body, with what sacrifice of comforts in the wilderness, with what patience of hope and courage of faith and labors of love, no words can fitly portray. Not a mile of railroad had been built. The river and the canal, the stage coach, the emigrant wagon, and the saddle, were the only conveniences of travel, and to these the missionary added foot-sore and weary tramps from settlement to settlement. During the same period 125 Puritan churches had been gathered in the growing settlements of New York State, supported in whole or in part by home missionary funds.

All these earlier efforts were marked by a commendable absence of the sectarian spirit. A common danger threatened the nation. The problem presented to the churches of the East was how to overtake the new and rapidly multiplying settlements with the means of Christian civilization. No rivalry entered into the struggle, but only a strong sense of the need of prompt, united action. In their love of humanity and of country every thought of denominational supremacy was buried under the all absorbing issue whether the New America should be heathen or Christian. This spirit was particularly active between Presbyterians and Congregationalists which were then the strongest church bodies in the land; for 50 years, between 1801 and 1851, they carried on their missionary work in the new settlements under a "Plan of Union," mutually agreed to, by which the churches of either order, wherever formed, might worship in the same house, listen to the same pastor and profess the same creed, while at the same time they were left free to govern themselves by the polity they loved and preferred.

MISSIONS

In 1820, Congregational, Presbyterian, Reformed and Associated Reformed churches, united at New York city in organizing a National Society. Such change of policy had become necessary. Hitherto, State Societies had been doing national work, each in its own way. But several missionary organizations working independently had resulted in an unequal distribution of men and money. Some sections had been over-supplied and others were left destitute. Moreover, the laborers themselves came into conflict with each other. The time had arrived for federation and co-ordination of effort, and to this end the American Home Missionary Society was organized, as above stated, with headquarters in New York city, the various State Societies making themselves auxiliaries to the National organization. Perhaps nothing more potential in the progress of American Home Missions belongs to its history than this act. For years the churches making the alliance labored together in fraternal unity, contributing to a common treasury and governed by a single board of direction. Receipts rapidly increased, the missionary force doubled and trebled, and instead of being an itinerant preacher, the home missionary became a settled pastor, dwelling among his people. It was only when these allied church bodies had grown strong that they withdrew one by one to organize separate Societies, leaving the Congregationalists to inherit the name and traditions of this honored organization. Indeed, it was not until many years later that "American" was dropped from its charter name and the designation of "Congregational" was substituted. Meanwhile the Methodists had organized their "Missionary Society" (national) in 1819, including home and foreign work; the Episcopal Church, its "Domestic and Foreign Missionary Society," in 1821; the Baptists, their "American Baptist Home Mission Society" in 1832, also national; the Lutherans, their "Home Missionary Society of the General Synod" in 1845, and the Disciples, their "American Christian Missionary Society, in 1849. The Southern Presbyterians, Southern Baptists and Southern Methodists have also their home missionary organizations which are doing a great religious work in the Southern States. Thus, by natural evolution, all the leading church bodies of America have gradually become organized for home evangelization and a movement, which began in 1798 for the Christian enlightenment of the New Settlements, has developed into a system as broad as the national domain, by which the stronger churches of the land are sharing the burdens of their weaker brethren and strengthening those forces of Christian civilization upon which the safety of the nation depends.

The purchase of Louisiana (q.v.) 100 years ago imparted a mighty impulse to the missionary movement. That expansion gave us the mouth of the Mississippi and undisturbed possession of its entire course. It carried our western boundary from Lake Superior to the Rocky Mountains, doubling the national area by a stroke of the pen. Fourteen States and Territories have been carved out of the Louisiana Purchase. They include the great corn and wheat belts of America, and their underground treasures are among the richest of the world. Emigration from the East and Middle West began at once and has reached enormous proportions. It is

rivalled in volume only by the millions of foreign birth that have poured and are still pouring into this new and mighty West. By these movements a great missionary problem was presented which the organized home missionary army welcomed with zeal and have never wearied in their efforts to solve. The order of missionary progress through the Louisiana Purchase was strictly along lines of immigration. There is not a State in that vast tract which the home missionary did not enter while it was yet a Territory, and always in the first and feeblest stages of settlement. From Missouri to Iowa, from Iowa to Minnesota, Kansas, and Nebraska, thence to the Dakotas, and on from these points to Wyoming, Colorado, and Montana, and last of all, when the door was opened, to Oklahoma, until every State in this imperial purchase has been leavened with Christian institutions. Something of the volume of this work may be gathered from the fact that in 1895 over 27,000 Protestant churches were enumerated within the Louisiana Purchase, holding property to the value of \$58,000,000 and having 1,912,000 communicants, and, with rare exceptions, this church growth is the fruit of home missionary culture, begun, maintained and supported until the need ceased, by the missionary revenues of these Eastern Societies. The same process was repeated when about midway in the century the Oregon Treaty made sure our possession of the Northwest and the discovery of gold opened the Californias to the world. Home missionaries ordained in the East promptly started for the Pacific Coast, reaching their fields by the way of Cape Horn and the Sandwich Islands. The strategic position of the far West and Northwest as related to the work of foreign missions in China and Japan was keenly appreciated by the churches and their missionary boards at the East. Money was contributed freely and many of the ablest preachers of the East went forth cheerfully to lay the foundations of Christian society on the sunset shores of the Republic. "The Mexican Cession," including Texas, New Mexico, Arizona and Utah, was another belt of peculiar missionary need, which in spite of ancient superstitions and modern delusions, has proved a rich field of rewarding home missionary effort.

The close of the Civil War introduced, at the South, a home missionary problem that was absolutely new, and which continues to absorb the interest of northern churches to an extraordinary degree. Four million slaves were suddenly set free. Government opened its bureaus of relief, and the churches of the North through their missionary boards hurried forward preachers and teachers. The greatness of the opportunity quickened the home missionary spirit of the whole country. Several of the boards opened freedmen's departments and the churches magnified the privilege of responding to their appeals. To the missionary, himself, there was in this call an element of peril which, so far from deterring him, only stimulated his zeal. The Yankee preacher and teacher were not well received at first by the white South. Social ostracism was not the only penalty they had to face for their devotion. Violence to their persons and destruction of their property were not infrequent in the early years of this missionary endeavor. An ugly spirit of caste included the negro teacher with the negro, and young women delicately reared in the best homes

MISSIONS

of the North suffered from neglect or open indignity. These conditions have mostly passed away; respect, and even gratitude, on the part of the South, have been won, as the fruits of this vast home missionary effort have become more apparent. These fruits appear not only in organized churches for the negro race, but in a long array of universities, colleges, academies, normal, common, and industrial schools, planted exclusively for the benefit of the blacks, all of them specifically Christian, and all of them originally supported by the free-will offerings of northern churches. Howard, Hampton and Fiske, Atlanta and Tugaloo, Talladega and Straight, Shaw and Richmond, Wayland and Leland, Nashville and Bishop, and a host besides, are names as familiar to the educational world as Harvard, Yale, or Princeton. They are all the fruit of negro emancipation and all of them are the creation of home missionary interest and enterprise.

It was in 1840 that foreign immigration began to attract the attention of the friends of home missions. Up to that time its entire volume from all sources had not exceeded 500,000. Then began the flood. During the next 30 years the country received about 6,000,000 foreigners. Driven by famines and oppressions at home and drawn by the opportunities of labor in a new country and by our generous homestead laws, they were arriving, for continuous years, at the rate of from 500 to 1,000 per day. Between 1865 and 1885 more than 7,000,000 were added to our foreign population, which means that in these 20 years foreign immigration exceeded that of the entire previous record of the country. It is needless to say that, as this vast problem began to be measured and sanely comprehended by the churches, the appeal of home missions was almost revolutionized. Hitherto that appeal came from our own people and often from our own kin. To follow close after them on the westward trail and to stand with them in planting the church and the school had been for years the whole of home missions. While this feature has never lost its claim and probably never will, another claim has entered to divide the attention and concern of the churches. To the peril of domestic heathenism has been joined the larger fear of imported barbarism, and thus for many years foreign missions at home has come to be a distinct interest of American Home Missions. All branches of the church have taken part, through their organized societies, in this effort to Christianize the alien. No nationality has been overlooked; Germans and Scandinavians, Bohemians, Poles and Russians, Hollanders and Hebrews, Spanish, French, Italians, Armenians, Chinese, every sort and condition of foreigner, however forbidding or hopeless, has been made the object of home missionary culture, with results that have astonished the most sanguine believer and rebuked the most despairing doubter and which have all but silenced the prophets of evil who predicted the direst consequences from the infusion of so much foreign blood into the moral, social, and political life of the nation. Many times over it has been demonstrated that every grade of foreign immigrant is susceptible to religious development and is entirely capable of being both civilized and Christianized, and is in fact being rapidly assimilated, through the agencies of education and religion, into the best types of

American life. Great migrations are not feared to-day as they were in 1840. Fears have been quieted and the native American stock have come to view with less and less alarm, what 50 years ago almost crazed them with apprehension.

To attempt any adequate summary of the results of Home Missions at the end of 100 years, would require a survey of the development of 50 States and Territories, so vitally have the home missionary and his work entered into the beginnings and the early history of all our Commonwealths. A few salient facts must suffice. The vitality of the home missionary idea has shown itself, first of all, in the growth of organizations. Beginning in 1798 with the Connecticut Missionary Society it has multiplied itself into more than 30 home missionary bodies, all Protestant, all evangelical and all national. These organizations have collected and disbursed \$140,000,000. Their chief agent has been the Church, with its ordained preacher and its divinely appointed ordinances, and for the Church, these millions have been given. This total, however, takes no account of co-operating agencies, which have been called into being to serve the missionary work of the churches. Add these: Sunday School planting; Bible and Tract printing; Church building and Christian education; which by careful inquiries are found to have expended \$150,000,000 more, and the grand total for Home Missions, root and branch, in organized form, is \$290,000,000. Not a dollar of this immense fund has been *paid* in any commercial sense for value received. All of it has been *given*, a free-will offering of Christian people to mark their intense conviction of the peril of a nation without the Gospel, and their supreme faith in its leavening power. What have these millions accomplished and what of visible fruits remain to justify their cost? It is a fact not generally known, and when known not sufficiently appreciated, that the great evangelical bodies of the United States trace most of their church organizations directly to Home Missions. Congregationalists admit that four fifths of their churches are of home missionary origin. The proportion would be larger but for the fact that hundreds of their churches were born before home missions began. Presbyterians confess that nine tenths of their churches are of home missionary planting. Baptist, Methodist and Episcopal estimates range from five sixths to nine tenths. Such ratios can mean but one thing; that these far spreading ecclesiastical bodies have become strong in church power, not by their own help but by home missionary aid, the few, strong, bearing the burdens of the many, weak, and they answer the inquiry which suggests itself at once to a thinking mind: where and what would these ecclesiastical establishments be to-day but for the helpful agency of organized Home Missions? To the credit of home missions, therefore, should stand the undoubted truth, that an overwhelming majority of the evangelical churches of America owe their being to its nurture and care. What does such a fact mean in the religious development of the country? In the year 1899, the United States had one evangelical communicant in 14.50 of the population. In 1850 that ratio had grown to one in 6.57; in 1870, to one in 5.78; in 1880 to one in 5; in 1890, to one in 4.53; and in 1900, to one in 4.25. In other words, evangelical church membership increased three and one half

MISSIONS

times faster than the population, in less than 100 years. Between 1800 and 1890, population increased 11.8 fold; in the same period evangelical church membership increased 38 fold. To these figures, Dr. Daniel Dorchester, their compiler, adds the comment: "This exhibit of religious progress cannot be paralleled in the history of God's kingdom in any land or any age." It is only 130 years since Voltaire in Geneva declared: "Before the beginning of the 19th century Christianity will have disappeared from the earth," and it is less than 100 years ago that American infidels were prophesying that the Church would not survive two generations in this country. In defiance of these dismal auguries between 1800 and 1850, the average yearly increase of evangelical communicants was 63,302; between 1850 and 1870, 20 years, 157,170; between 1870 and 1880, 10 years, 339,258; between 1880 and 1890, 10 years, 375,765, and during four years, between 1890 and 1894, 348,582, the prophecy of a larger average than ever for the last decade of the century. It is no vain boast, therefore, but the obvious truth, that by far the larger part of this remarkable growth is due to the direct agency of American Home Missions, since in its own carefully planted gardens most of this growth has taken place. But not the only, nor even the highest, fruits of home missionary effort are contained in these numerical results. President Roosevelt, in a recent public address, declared: "It is such missionary work that prevented the pioneers from sinking perilously near the level of the savagery against which they contended. Without it the conquest of this continent would have had little but an animal side. Because of it, deep beneath and through the national character, there runs that power of firm adherence to a lofty ideal upon which the safety of the nation will ultimately depend." Thus Home Missions has been in a very true and high sense both the builder and the savior of the American nation. In a government of the people and by the people, nothing counts for so much as high ideals of duty. With these enthroned in the thought and life of its citizens a nation may meet any shock from within or from without: and nothing has yet been discovered on earth or revealed from heaven that has the power to create higher ideals of duty than Christianity and the obligations it inculcates. It is thus that missionary societies, whose sole function is the planting of churches, enter into the hidden life of a nation in ways that political parties can never enter, and which even Christian men are sometimes slow to appreciate. Not only law, order, temperance, respect for the Sabbath, security of life and property, and the claims of humanity, are thus conserved and fostered, but the instinct of patriotism itself, in which the very life of the nation consists, finds its nursing mother in the Church of Christ. Many victories of a Christianly educated public sentiment might be cited in American history, but the Civil War of 1861 furnishes a typical example. When that inevitable conflict came the value of 65 years of church planting by American Home Missions in the East, the West, and the Northwest, began to appear. Every home missionary pulpit flamed with patriotic fire and summoned its worshippers to arms. Congregations and Sunday Schools were decimated by enlistments. From a careful inquiry made near the close of the War it was ascer-

tained that the home missionary churches of the entire West, on both sides of the Mississippi, "had sent into the army one in four of their entire male membership, including in the count old men, invalids, and boys." Commenting on this fact that peerless interpreter of history, Richard Salter Storrs, was moved to declare in his Brooklyn pulpit, "Home Missions saved this country once, and will save it again if necessary."

JOSEPH B. CLARK,
Secretary Congregational Home Missionary Society.

Missions, Roman Catholic Church, Home and Foreign. A complete account of the Missions in the Roman Catholic Church would be coterminous with the history of the growth and progress of Christianity, for the Church is essentially missionary. The commission that was given to the Apostles, by the Founder of Christianity, was not to establish a system of philosophy, nor even to maintain a ceremonial form of worship, but it was: "Go ye into the whole world and preach the gospel to every creature." For the first time in the history of the world was there conceived a project of forming a worldwide institution, that would embrace all nations under one headship, no matter how divergent their ideas or their racial traits. The measure of the universality of the Redemption was the fact that the Church was not to be national or racial, but it was to be Catholic or Universal, for all peoples and for all ages. It was designed to be the continuation of the beneficent work of the Incarnation of the Son of God "unto the consummation of all things." To create this worldwide institution, the primary business of the Apostles, and their successors, was to preach the gospel to every creature, and the highest vocation of the Church therefore is the missionary vocation.

It would be difficult, then, to give anything but a meagre sketch of the efforts that were

MISSIONS

put forth to widen the saving influences of the Church, and the ultimate crystallization of the fruits of these efforts into the marvelously complex organization, whose centre is in Rome and whose ramifications extend to the uttermost ends of the earth.

The history of the work of the Missions begins on the first Pentecost in the market place of Jerusalem, wherein were gathered representatives from all the nations of the earth. The providence of God had prepared the time and the place through a thousand years of effort, first by preserving the monotheistic idea of God among the Jews, second, by importing Greek culture and intellectuality (it was no mere accident that led to the translation of the sacred writings of the Hebrews into the Greek Septuagint), and third, by creating the great civil organizations of the Roman Empire, whose well-made roads led to the pillars of Hercules on the west and to the waters of the Danube on the east and beyond. The same providence of God that had prepared the soil, selected the special psychological moment for the seed-sowing, and on the first Pentecost, Peter stood up in the midst of that throng in the market place, and preached the first great missionary sermon, a verbatim report of which is given to us by Luke the Evangelist and in Greek, too, that all the world might read it (Acts ii.). There were 3,000 converts made that day. The same chronicler tells later on of the missionary journeys of Paul and of the many neophytes that were baptized into the Church. Finally both Peter and Paul came to the city of Rome, and there the Prince of the Apostles set up his throne under the shadow of the throne of the imperial Cæsars, and there it has remained ever since, and out from Rome, and with the authority of the Roman Pontiffs, have gone the missionaries that have converted the heathen world to Christianity. Into Italy they went, and beyond into Gaul and Hispania and into the forests of Germany, and along the Danube into the regions of Eastern Europe. Before three centuries went by, the missionaries with Roman Catholic ordination celebrated the divine mysteries and with Roman Catholic consecration exercised ecclesiastical jurisdiction, and after they had preached Roman Catholic doctrine and had gathered the fruits of their labors, they brought them to the feet of the Roman Pontiff for his blessing. A good type of this work is seen in the conversion of Britain. Pope Eleutherius (178 A.D.) sent Fugatus, and Damianus to Britain at the request of Lucius, a British chieftain, and an incipient hierarchy was established. (Bede. I., ch. iv.); (Tertullian, 'Adv. Hær.' i.)

During the persecution of Diocletian (303 A.D.) many Christians in Britain were done to death and the British Martyrology was headed by the illustrious Saint Alban. The happy effect of the change that was wrought by the edicts of Constantine was a source of joy in Britain, because Constantine's mother, Helena, was the daughter of a British prince, and his father, Constantius, was converted and died in the faith at York in Britain. (Euseb. in 'Vitæ' 17.) When the Pelagian heresy began to disturb the faithful of Britain at the instance of the deacon Palladius, Pope Celestine sent Germanus of Auxerre, in his own stead, to drive out the

heretics. (Saint Prosper's 'Chronicle,' 429 A.D.) So with more or less fervor of piety (Gildas ch. vii.) Britain preserved the faith of the Roman Catholic Church, "entire, and inviolate" and maintained the succession of British bishops up to the time of Saint Augustine, whom Pope Gregory the Great (597 A.D.) sent to England to convert the Anglo-Saxon, and for a thousand years afterward all spiritual jurisdiction was from Rome.

The same story is true in Ireland: Saint Patrick was sent by Pope Celestine; Saint Boniface went into Germany with a similar message and authority; and in a like way Denmark and the Scandinavian peninsula were brought in subjugation to the yoke of Christ. The missionary went first, and as has been done in India and in China in the 19th century, then gradually the native churches began to grow in numbers, a bishop was sent with consecration and authority from Rome, and the nascent church assumed definite organization until in the course of time it grew into hierarchical perfection. Looking at the missionary work of the Roman Catholic Church from one point of view, there are no Foreign Missions, because she is a worldwide organization, at home in every land.

This work of evangelizing the countries of Europe went on with more or less ardor all through the Middle Ages. The barbarian races rushed in at the breaking up of the Roman Empire and while the military power was too weak to stem the onward rush, still the spiritual masters of the Church met them and chastened their fierce, warlike spirits, and made them submissive to law and order. The vast monastic system grew up. Canon Farrar says:

Under the influence of Catholicism the monasteries preserved learning and maintained the sense of the unity of Christendom. Under the combined influence of both, grew up the lovely idea of chivalry molding generous instincts into gallant institutions, making the body vigorous and the soul pure, and wedding the Christian virtues of humility and tenderness to the national graces of courtesy and strength. During this period, the Church was the one mighty witness for light in an age of darkness, for order in an age of lawlessness, for personal holiness in an epoch of licentious rage. Amid the despotism of kings and the turbulence of aristocracies it was an inestimable blessing that there should be a power which by the unarmed majesty of simple goodness made the haughtiest and boldest respect the interests of justice, and tremble at the thought of temperance, righteousness, and judgment to come.

The crusades were but great witnesses to the missionary power of the Church, and they did not a little to break the power of Islam, and save Europe from Mohammedan blight. In the 11th century came the great preaching orders, notably the Dominicans, and the Franciscans, and for the next three centuries the voices of these missionaries were heard in every corner of the civilized world. The fall of Constantinople and the consequent spread of the city's learned men through the West was a new leaven to awaken the European mind, and the invention of the astrolabe, together with the art of printing from movable types, gave a new impetus to the missionary movement. Columbus was filled with this spirit, and one of his deepest purposes was to find a shorter way to India and the East in order to bring the gospel to the people who sat in darkness and in the shadow of death. His expedition from Palos was a profoundly religious affair, and on his return from the newly discovered continent, he

MISSIONS

brought six dusky savages, who were duly instructed and baptized, and Queen Isabella stood at the font of baptism as their godmother. These six converts to Catholicism (1498) have become the 12,000,000 Catholics of the United States, 1904. Other discoverers followed Columbus, and while their voyage was in many instances a search for the "Golden Fleece," yet they invariably brought with them missionaries, and wherever they landed their first act was to erect the cross, and gather the natives to listen to the tidings of salvation. The Cabots planted the cross on Cape Cod 120 years before the landing of the Puritans at Plymouth Rock. Champlain, who, as Bancroft says, "considered the salvation of one soul more important than the conquest of an empire" opened the Northwest to civilization. Cortez introduced missionaries among the Indians of Mexico; and La Salle, who had been trained in a Jesuit novitiate, brilliant, restless, daring, went by the way of the Great Lakes and down the Mississippi, and opened the West to missionary effort.

While the stories of the wonderful Western world were being whispered in Europe a little knot of ardent spirits gathered about Ignatius Loyola at Paris and plighted their vows to work for God. One of the number was Saint Francis Xavier, who within two decades preached to and baptized hundreds of thousands in India, and penetrated to the very gateway of China. During the 16th century fierce religious dissensions broke out in Europe, and the German and English nations were lost to the Church, but the Jesuit missionaries, together with the Franciscans and Dominicans, made a mighty recompense for the losses in Europe by the gains they secured in India among the Brahmans, in China among the Confucianists, in South America among the Indians, and in North America among the savages.

The 16th and 17th centuries were marvelous in the record of missionary triumphs. China had been a sealed book for 2,000 years, but "Where neither merchant nor traveler has penetrated the Roman Catholic missionaries have found their way." (Gutzlaff, 'China Opened,' Vol. I., ch. vi.) They brought to Europe exact knowledge of the hidden empire and they did it in defiance of every menace of torture and of death. In 1583 Father Ricci landed at Canton, and for 27 years, in the habit of a Bonze or a Literati, he pursued his way to the imperial throne, and baptized many princes of the reigning family. When he died, there were more than 300 churches in the different provinces (Gutzlaff, 'History of China,' Vol. II.), and by his public interment, with the emperor's official sanction, Christianity was legalized in China (Abbe Huc, Tome II.). He was succeeded by Father Adam Schaal, S. J., who taught the Chinese all they know of mathematical science, and later on by other missionaries. The storm of persecution came and "more than 300 churches were either destroyed or converted to profane uses, and more than 300,000 Christians were abandoned to the fury of the heathen" (Du Halde). The story of their dreadful sufferings, their fierce tortures, and their agonizing deaths reads like the acts of the martyrs in the early Roman persecutions. In the meantime the evangelization of the Philippines was going on. Three centuries of effort

has left six millions of the Malay race deeply imbued with the principles of Christianity, so that Peyton (Episcopalian) was able to write of them:

I found in all the towns a magnificent church. I attended mass several times, and the churches were always full of natives, even under unfavorable circumstances, on account of the military occupation. There are almost no seats in these churches, the services lasting from an hour to an hour and a half. Never in my life have I observed more evident signs of deep devotion than those I witnessed there—the men kneeling or prostrated before the altar, and the women on their knees or seated on the floor. Nobody left the church during the services, nor spoke to any one. There is no sectarian spirit there. All have been instructed in the creed, in prayer, in the ten commandments, and in the catechism. All have been baptized in infancy. I do not know that there exists in the world a people as pure, as moral, and as devout as the Filipino people. (Report of Philippine Commission.)

South America, too, had been traversed by the missionary, and the Indians of the Andes as well as the wild tribes of Paraguay had accepted the religion of Christ. Whatever the races of South America and of Mexico know of Christianity to-day, they have learned it from the missionaries of the Roman Catholic Church.

Since the year 1622 the work of the "Missions" has been so specialized as to make it a department of Church Administration. In that year Pope Gregory XV. canonically instituted the Congregation de Propaganda Fide, and gave to it the duties of church extension. The Cardinal Prefect of the Propaganda is second only to the Pope himself in power, for he has jurisdiction over all so-called missionary countries. The present prefect (1904), Cardinal Gotti, is assisted by 25 other cardinals, and as many consultants, making a quasi-senate for the administration of church affairs. Affiliated with the Propaganda there are half a hundred colleges and seminaries for the education of the natives of the missionary countries, and in these colleges most of the languages of the civilized and uncivilized world are taught. The Propaganda has a polyglot press for the printing of literature.

In 1862 Pope Pius IX. instituted a special congregation for the affairs of the Oriental Churches, for the Roman Catholic Church exercises a jurisdiction not only in Europe but over portions of the ancient Eastern Churches whose beginnings are traceable to the Apostles other than Saint Peter, and claims a jurisdiction over them all through the primacy of Saint Peter. These Churches in communion with the Pope are united in a complete doctrinal life, that is, all and every one of the dogmatic teachings of the Roman Catholic Church are accepted by the adherents of these Eastern churches, though they are permitted to retain their ancient liturgies which may be peculiarly their own, and they are not obliged to conform in all matters of discipline, as, in some instances, a married clergy is permitted among them. A distinction has always been made between the acceptance of the dogmatic formularies and the toleration of varying rites and ceremonies. In the former the Church is most exacting, she never permits the least variation in the letter or the spirit of her teaching, but like an indulgent mother she permits her children to maintain their time-honored customs, liturgies, and languages.

MISSIONS

The Oriental Rites, under the administration of the Propaganda, are as follows:

1. The Ethiopian or Abyssinian Rite, principally in the Abyssinian Church, first planted by Saint Matthew, increased by Saint Frumentius, in the 4th century, was represented at Council of Florence 1445,—principal missionary of modern times Joseph Sapeto. It includes 30,000 souls.

2. Armenian Rite—gospel first preached by Gregory the Illuminator, though the modern Church was reorganized by constituting the Bishop of Cilicia as Patriarch of the Armenians. The liturgy is in ancient Armenian. It includes 109,000 lay members and 357 priests.

3. Coptic Rite—Church first established by Saint Mark, disciple of Saint Peter and bishop of Alexandria in Egypt. The people went into schism under Dioscorus, but later on were restored to the unity of the faith. The bishop of Alexandria is the patriarch; 22,500 members with 44 priests.

4. Greek Rite—subdivided into (1) Pure Greek in which the Greek language alone is used; (2) Rumanian Greek; (3) Bulgarian Greek, using the Slav language; (4) Ruthenian Greek, and (5) the Melchite Greek. The entire Greek rite in communion with Rome numbers 4,645,803 members with 5,251 priests. They have numerous seminaries and educational institutions.

5. Syriac Rite, subdivided into (1) Pure Syriac; (2) the Syro-Chaldaic; (3) the Syro-Malabaric, and (4) the Maronites. The Syrians number 626,029 with 1,171 priests. All these Oriental Rites together make a total of 5,433,332 members under the administration of many bishops and 6,823 priests. Many of these Eastern Churches have their seminaries for the training of their missionary priests in the city of Rome. Under the jurisdiction of the Propaganda, according to the official statistics published in 1898, there are:

Oriental Churches—5,433,332 members, 6,825 priests.

Occidental Churches—27,218,297 members, 33,148 priests.

The latter are distributed as follows:

	Members	Priests
England	1,362,489	2,674
Scotland	373,500	432
Ireland	3,547,079	3,445
Norway		
Sweden }	9,750	74
Denmark }		
Holland	1,854,340	3,168
Balkan Penninsular	686,210	890
Greece	34,710	109
Turkey	129,680	310
Persia	7,650	11
Arabia	1,500	11
India (Eng.)	1,870,000	1,180
China Indian (Penninsular)	827,680	823
Malay, Borneo, Java, Siam	57,890	89
Chinese Empire	532,448	1,168
Korea and Japan	84,410	772
Africa	458,170	1,015
British America	2,187,480	2,766*
United States	9,479,250	10,049*
West Indies	339,200	195
Patagonia	99,500	70
Australia	704,170	736
Polynesia	196,850	348

* 11,289,710 population and 12,968 priests.—Official Directory for 1903.

This list does not include the Philippine Islands, Porto Rico, Cuba, Mexico nor any of the South American countries, as these countries were ancient dependencies of Spain, and therefore not under the Propaganda. The total aggregate under both branches of the Propaganda or the Missionary department of the Roman Catholic Church at the close of the century was over 32,000,000 with about 40,000 priests.

This statement does not take into account the large army of teaching orders of brothers and sisters, and native catechists, nor does it give any estimate of the educational institutions, hospitals and orphan asylums that are under the auspices of the Church in these countries. Some idea of the growth of the missionary work of the Church may be realized from the fact that at the beginning of the 19th century there were only 5,000,000 under the jurisdiction of the Propaganda, at the beginning of the 20th century there were over six times that number.

This account will be incomplete without some statement of the material resources by which the missions have been carried on. The Congregation of the Propaganda has vast funded resources amounting to \$135,000,000, the revenues of which are applied to the support of the work and the colleges under its care. Beside this there have grown up during the 19th century many auxiliary societies; the principal one is known as the Lyons' Society for the Propagation of the Faith. It began with the idea of assisting the poverty stricken missions in New Orleans under Bishop Dubourg, but it soon broadened its scope. It asked only a cent a week from its members, and during its existence (1822-1900) it has gathered and spent \$65,690,017. The 'Annals of the Propagation of the Faith,' the official organ of this society, is now issuing 300,000 copies every two months and in 12 different languages. There are 58 different religious societies of priests engaged in the work of the missions, together with 82 orders of Brothers who have no aspirations to the priesthood, yet are consecrated to missionary work, and 434 different orders of religious sisterhoods. These 574 different societies embrace a membership numbering very nearly 100,000 who have left all that this world holds dear, of houses, land, country, and the pleasures of the domestic hearth, and have sacrificed their lives in poverty, celibacy, and exile for the souls of the heathen and the unevangelized. Their consecration to this life is not for a few years, but they count it their greatest joy to spend and be spent till death comes, that the blessed name of Jesus Christ may be better known and more deeply loved.

Under the caption of Home Missions, a short account may be given of the missions to non-Catholics in the United States. The idea of the need of organized effort to present the teachings of the Catholic Church to the American people, is what brought together five priests, Isaac Hecker, Augustine F. Hewit, Clarence Walworth, Francis Baker, and George Deshon, who founded the organization known as the Paulist Fathers (q.v.). This idea was practically systematized in its present form by Rev. Walter Elliott, in September 1893, when he began, in Michigan, a series of missions in public halls and churches for the purpose of explaining the doctrines of the Catholic Church. These mis-

MISSIONS

sions to non-Catholics prohibited controversy and invited the spirit of inquiry by placing a "Question Box" at the door, into which were dropped all questions concerning the teachings of the Church which anyone desired to have answered. During the last 10 years the work has grown to vast proportions. While the Paulists inaugurated the movement in the United States, yet the work is the normal work of the Church, and therefore belongs to every branch of the service, particularly to the diocesan clergy. The leaders of the movement contemplate the placing in every diocese a band of talented preachers whose business will be extra-parochial, and whose duties will be to go into the towns and country places where the Church is weak, or does not exist, and arrange for the inauguration or strengthening of Church organizations. This band of diocesan missionaries will largely do the duties of a Church extension committee in the spiritual and missionary sense. The growth of this "Home Missionary Movement," after 10 years, has been such as to necessitate the building of the Apostolic Mission House, at the Catholic University at Washington. This institution will provide special lectures and instructions in missionary methods, and in this way will give training to the diocesan missionary. The legal organization which is financing the work, is the "Catholic Missionary Union," incorporated under the laws of the State of New York. Its president is the archbishop of New York, *ex-officio*, and there are six other directors. The practical effect of 10 years of this home mission work has been to give the American people a more correct view of the teaching and spirit of the Catholic Church, to eliminate antagonisms, and to make Church relationships more harmonious. It has also tended to increase, and this in no small degree, the stream of converts that has been flowing into the Church.

The growth of the Roman Catholic Church under the jurisdiction of the Home Missions during the last one hundred years has been one of the marvels of the 19th century. The following figures give some measure of it:—In 1800 there were 40 priests; in 1830 the number increased to 232; in 1850 to 1,800; in 1904 to 12,000. In 1800 the Catholic population was 100,000, in 1904 it is 14,000,000 (estimated by Cardinal Gibbons). In 1800 there were but 25 churches; in 1904 there are 12,000. The value of church property, as given by census reports in 1850, was \$2,256,758; in 1860 it was \$26,774,119, a ratio of increase of 189 per cent, while the aggregate wealth of the country increased only 125 per cent. In 1870 it was \$60,985,565. In 1890 value of church property had risen to \$118,069,746.

While this external growth indicated by numerical strength and material wealth is very remarkable, the internal growth indicated by evidences of maturing organization as well as by signs of increasing spirituality, is none the less remarkable. The first flowering of the Church's inner life is the vocations to the religious orders whereby men and women accept the call to the life of the evangelical counsels. In 1700 there was one convent with less than 10 religious; in 1904 there are over 5,000 convents with nearly 60,000 religious. This army of men and women devote themselves without

hope of worldly gain to the alleviation of the ills of humanity in the hospitals by the sick bed, in the tenements of the poor, in the slums among the depraved, in the asylums caring for the orphans and among the aged, who have been stranded on life's shore, without one cent of salary, contenting themselves with meagre fare, with short hours of sleep on a hard bed, and long hours of prayer and devotion to the sick and the poor and the wretched, because they know and are convinced that their reward will be very great in heaven. Many of these religious communities are offshoots of orders that have been established in the old country, but some are indigenous to the American soil. Noteworthy among the communities of men are the Paulist Fathers, founded by five converts, and among the women the Sisters of Charity, founded by Mother Seton, also a convert.

The growth in the Church in the United States of course is principally due to the great stream of emigrants, but not the least element of growth and present strength is the large number of converts who have been drawn to her through the conviction that she is the one Catholic and Apostolic Church. There are no accurate statistics of yearly conversions, but Cardinal Gibbons puts it in this way: "If the same ratio of conversions is preserved throughout the country as exists in the archdiocese of Baltimore, the yearly number of conversions would amount to 44,800 souls. To sum up the aggregate number of Catholics under the American flag is as follows: United States (Cardinal Gibbons' estimate), 14,000,000; Philippines, 6,600,000; Porto Rico, 980,000; Hawaii, 33,000; American Samoa, 3,000; Guam, 9,000, making a total of 21,625,000 souls under the jurisdiction of an apostolic delegate, a cardinal, 13 archbishops and 87 bishops.

REV. A. P. DOYLE, C. S. P.,
Secretary The Catholic Missionary Union.

MISSISAGA INDIANS — MISSISSIPPI

Missis'aga Indians, an American tribe of the Algonquian family residing in Ontario, Canada. The name refers to the eagle. They signed a treaty in 1764 with an eagle as their tribal mark. In 1746 the tribe was admitted to the Iroquois confederacy. There are upward of 600 of the Missisagas remaining. They live on small reservations in Ontario, are mostly Methodists, and are healthy, progressive, peaceful citizens.

Mississippi, one of the southern United States and the seventh admitted to the Union; situated between lat. $30^{\circ} 13'$ and 35° N., and long. $88^{\circ} 7'$ and $91^{\circ} 41'$ W.; extreme length, north and south, 332 miles; average breadth 142 miles, varying from 78 miles below lat. 31° N., to 189 miles on that parallel, and 118 miles on the north line; area, 48,610 square miles, being 1.61 per cent of the territorial extent of the United States. It is bounded north by Tennessee, east by Alabama, south between the Alabama line and Pearl River by the Gulf of Mexico, and from the Pearl to the Mississippi on the parallel of 31° N., by the State of Louisiana; and west by Louisiana and Arkansas, having below lat. 31° N. the Pearl River, and above that line the Mississippi, as the dividing lines. The Round, Horn, Ship, Deer, Cat, Pois, and several other islands lying outside of and forming the southern limit of the Mississippi Sound, belong to this State. It was admitted to the Union 10 Dec. 1817, and takes its name from the river which forms its western boundary for a distance of over 500 miles. There are 75 counties in the State. Pop. (1900) 1,551,270. The capital city is Jackson.

Topography.—Mississippi lies in two divisions, separated by a low broad watershed, the eastern rivers flowing into the Gulf of Mexico, and the westernmost streams emptying into the Mississippi. East of the ridge the surface of the State consists of broad rolling fertile prairies, the ridge itself is rolling and broken into narrow valleys where streams afford plentiful water supply, while to the west the land falls away into the low swampy lands of the Yazoo and the Mississippi rivers. The State is very low, the highest altitude being but 1,000 feet. The coast has a shore line on the Gulf of Mexico of 88 miles, or including the irregularities and islands, of 287 miles. In the eastern part of the State the prairies are covered with grass during the greatest part of the year. East of this prairie region extends a level but very fertile tract on the upper course of the Tombigbee River. In the northern district is a range of hills of moderate elevation, well wooded but devoid of undergrowth. These hills find their western limit in the Walnut Hills; and west of them, and between them and the Mississippi River, in about lat. $32^{\circ} 30'$, for a distance of more than 170 miles, north and south, and 60 miles extreme east and west, the country is occupied by immense bottom lands, produced and fed by the inundations of the Mississippi, constituting the so-called "Delta." Nearly all of this low region has been reclaimed by a system of levees, and is now rapidly being opened up and settled, and penetrated by railroads. The bottom lands are about 7,000 square miles in extent.

Rivers and Lakes.—Mississippi is well watered by the Homochitto, Big Black, Yazoo, Sunflower, and Tallahatchie rivers, all emptying

into the Mississippi, and the Pearl, Pascagoula, and Tombigbee, all emptying into the Gulf of Mexico. There are many small streams in all parts of the State, which, though inferior in capacity to those already noticed, are locally important, watering extensive districts and giving fertility to the soil. In the bottom lands are numerous lakes, bayous and channels, and in this district, along the Mississippi, levees are built by the State partly from a fund derived from a special tax on the land, and partly with moneys derived from the sale of swamp lands.

Climate.—The State lies in what is called the semi-tropic climate belt. The winters are short and mild, the mean temperature 45° F.; the summers are devoid of intense heat, the mean 81° , seldom reaching 100° . Ice from one to two inches thick forms in the northern part of the State. The elevation of the surface and the Gulf breezes render the climate delightful during most of the year. The annual rainfall ranges from 48 to 58 inches. The death rate is very low—12.9 in 1,000. The heaviest rains occur in late winter or early spring, when the warm Gulf winds meet the cold north winds. The average wind velocity for the whole year is seven miles per hour; the prevailing wind for January is north, while it is south for July.

Geology.—Mississippi is occupied wholly by deposits of the Tertiary and Upper Secondary formations, which, sweeping around from the southern Atlantic States, attain here their greatest width. Near the Gulf of Mexico the sands and clays of the latest periods are spread over the country, and further north the deposits gradually become of greater age. At Vicksburg the Eocene appears at the base of the river bluffs, and the upper portion of these is covered by a deep deposit of yellowish loam or loess, containing fresh-water and land shells. This extends over the country eastward, and attains a thickness of 60 feet or more. The Upper Secondary appears near Jackson, and occupies the northern portion of the State. Fossil remains of a gigantic marine animal resembling the alligator are found in the prairie regions. In 1900 the clay products of Mississippi amounted in value to \$573,368. There were six mineral springs reported, with an output of 282,228 gallons, valued at \$48,617.

Minerals.—Mississippi is not a mining State. Clay is the principal product, together with marl, phosphate rock, hydraulic lime, gypsum and coal. None of these minerals are worked to any considerable extent.

Flora and Fauna.—There are over 100 species of trees in the State, including 15 varieties of oak. There are cypress, poplar, long-leaved pine, tupelo, sycamore, persimmon, magnolia, holly, cucumber tree, sweet gum, black-walnut, and various species of hickory, elm and maple. Wild animals, such as the deer, puma, wolf, bear, and wildcat are still occasionally seen. Alligators occur in the Mississippi as far north as the mouth of the Arkansas, and in some of the smaller rivers; and most of the streams abound in fish. Paroquets are seen as far north as Natchez, and wild turkeys are still common.

Forestry.—There were 32,000 square miles of timbered land in the State in 1900. The yellow pine ranks first among the forest trees, and extends northward from the coast for 150 miles. The hills, or bluffs along the Mississippi Delta,

MISSISSIPPI

extend to the prairie lands on the eastward, and afford numerous forests of oak, gum, poplar, tulip, ash, maple, and hickory, and a few pine trees. The prairies of the southern part are covered with the long-leaved pine. Only within recent years has the timber product been important. Nearly all the timber cut in 1900 consisted of yellow pine, and oak and other hard woods. Turpentine, resin, and other naval stores are no small portion of the product from the timber belt.

Agriculture.—The fertility of the soil and a favorable climate give to Mississippi eminent advantages as an agricultural State. Nowhere in the world are there such alluvial lands as the Mississippi bottom, or "Delta," contains—an alluvial plain in a mild climate, level as the surface of the ocean and of inexhaustible fertility; and this plain is only a small part of the fertile lands of the State. The table-lands of the north, the loams along the bluffs and banks of the Mississippi, the dark and heavy prairie lands, and the inland bottoms are of scarcely less fertility. The prairies, especially in the Tombigbee district, furnish excellent pasturage. Sugar is produced in the south, and cotton forms the great staple of a large part of the State. Maize and oats are grown everywhere, and wheat is sometimes, though not commonly, grown in the northern districts. All the fruits of temperate climates grow here in perfection; plums, peaches, and figs are abundant, and in the south the orange. The farms of Mississippi in 1900 numbered 220,803, and were valued at \$152,007,000. Of this amount, \$37,150,340, or 24.4 per cent, represents the value of buildings, and \$114,856,660, or 75.6 per cent, the value of land and improvements other than buildings. The value of farm implements and machinery was \$9,556,805, and of live stock, \$42,657,222. These values, added to that of farms, give \$204,221,027, the total value of farm property. In 1900, 41.7 per cent of the farms of the State were operated by white farmers and 58.3 per cent by colored farmers. Of the white farmers, 66.2 per cent owned all or a part of the farms they operated and 33.8 per cent operated farms owned by others. The corresponding percentages for colored farmers are 16.3 and 83.7 respectively.

The following table shows the acreage, quantities and values of the principal farm crops for 1899-1900:

Crops	Acres	Bushels	Value
Corn	2,276,313	38,789,920	\$18,873,934
Wheat	6,447	37,257	30,743
Oats	87,066	862,805	383,633
Rice (in pounds)	2,095	739,222	28,564
Hay and forage (in tons)	99,261	164,650	1,459,879
Cottonseed (in tons)		634,083	6,692,027
Cotton (in bales)	2,897,920	1,313,798	47,340,314
Tobacco (in pounds)	203	64,760	9,225
Peanuts	5,853	95,738	89,350
Dry beans	1,149	11,162	11,672
Potatoes	69,490	599,537	567,279
Sweet potatoes	6,370	398,272	245,777
Onions	38,169	2,817,386	1,458,490
Miscellaneous vegetables	233	26,243	24,058
	50,356		2,807,652

The total value of Mississippi crops for 1900 will approximate \$85,000,000, with 5,611,114 acres under cultivation. The total value of live stock on farms in 1900 was \$42,657,222, of which amount 33.1 per cent represents the value of

mules; 25.5 per cent that of horses; 15 per cent that of dairy cows; 13.3 per cent that of other neat cattle; 6.9 per cent that of swine; 3.9 per cent that of poultry; 1.3 per cent that of sheep; and 1 per cent that of all other live stock. The following table gives the number of domestic animals on farms for the year 1900:

Dairy cows	299,318
Other neat cattle	574,038
Horses	229,331
Mules and asses	216,032
Sheep	236,470
Swine	1,290,498

In 1900 sugarcane was grown by 26,300 farmers on 11,552 acres. From this area they sold 5,914 tons of cane for \$23,918, and from the remaining product manufactured 18,930 pounds of sugar, valued at \$893, and 1,413,219 gallons of syrup and molasses valued at \$618,975. The total value of sugarcane products was \$643,786. Sorghum cane was grown by 25,183 farmers on 15,734 acres, producing 3,366 tons of cane, and from the remaining product manufactured 1,162,269 gallons of syrup, valued at \$313,365. The total value of sorghum-cane products was \$323,417.

The fruit product of the State for 1900 was as follows:

	Number of trees	Bushels of fruit
Apples	705,796	249,035
Apricots	5,109	772
Cherries	30,186	2,352
Peaches	1,856,748	252,305
Pears	177,824	36,923
Plums and prunes	669,053	66,793

Population.—In 1900 out of a total population of 1,551,270 in Mississippi, the colored population aggregated 907,630, or 58 per cent of the total. In 1850 the colored population was 52 per cent of the whole. How this condition arose is best illustrated by a table showing the increase in population from 1800 to 1850, as follows:

YEARS	White Persons	Colored Persons		Total Pop.
		Free	Slave	
1800	5,179	182	3,489	8,850
1810	23,024	240	17,088	40,352
1820	42,176	458	32,814	75,448
1830	70,443	519	65,659	136,621
1840	179,074	1,366	195,211	375,651
1850	295,718	930	309,878	606,326

The total population of the State in 1860 was 791,305; (1870) 827,922; (1880) 1,131,597; (1890) 1,289,660; (1900) 1,551,270. There are 2,300 Indians in the State. The largest cities are Vicksburg (14,834 pop.); Meridian (14,050); and Natchez (12,210). Other important towns are Jackson, Corinth, Enterprise, Columbus and Carrollton.

State Government.—The State is governed under a constitution adopted in 1890. The governor is elected for a term of four years, and receives a salary of \$3,500 per annum. Legislative sessions are held biennially, beginning on Tuesday after the first Monday of January; but only the quadrennial sessions held in the leap years are unlimited in scope and terms, the other sessions can only deal with revenue and appropriations and such matters as the governor submits to them by message. The legislature is Democratic, each member receiving \$400 per

MISSISSIPPI

annum and mileage. There are 7 representatives in Congress. The State government in 1901 was Democratic. The legislature is composed of 145 representatives and 45 senators. There are three supreme judges, appointed for nine years by the governor, and circuit and chancery judges, appointed for four years. Voters must have resided in the State two years, in the election district one year. Registration is necessary, and the voter must be "able to read any section of the Constitution of the State; or he shall be able to understand the same when read to him, or give a reasonable interpretation thereof."

State Finances.—On 1 Sept. 1901 the total indebtedness of the State, including \$2,208,300 of debt for school funds, on which interest alone is paid, was \$2,811,300, and is nearly all held by State funds. The assessed valuation in 1900 was as follows: Real estate, \$131,315,821; personal property, \$57,400,338; total, \$215,705,947; and the tax rate, \$6 per \$1,000. The total receipts for the year 1901 were, \$2,436,048; total disbursements, \$2,229,996, leaving a surplus of \$206,052, and cash balance, \$828,453. The main source of income is a direct State property tax, which yields almost 85 per cent of the total income; of the disbursements in 1901, 30 per cent were for common school purposes and 15 per cent for redemption of the State debt.

Banks and Banking.—The first bank in the State was opened at Natchez in 1809. In October, 1901, there were 14 National banks in operation, with \$1,130,000 in capital, \$941,128 in outstanding circulation, and \$12,500 in United States bonds. There were also 117 State banks, with \$4,890,811 capital, and \$720,920 surplus; 5 private banks, with \$152,000 capital; and 3 trust and loan companies, with \$15,000 capital, and \$29,015 surplus. There are no savings banks in the State.

Education.—Nearly all the cities and towns in the State maintain graded schools for ten months in the year. Separate schools are conducted for the colored race. In 1900 the chil-

Spring; Millsaps College, Jackson; and University of Mississippi (q.v.). Among the most notable women's colleges are the Industrial Institute and College, Columbus; Blue Mountain Female College, Blue Mountain; East Mississippi Female College, Meridian; and Stanton College for Young Ladies, Natchez. The State supports an agricultural and mechanical college at Starkville; a college for colored youth at Rodney, and a normal school at Holly Springs for training colored teachers. In 1901 there were 224 periodicals issued in the State, of which 14 were daily, 1 tri-weekly, 5 semi-weekly, 181 weekly, 1 tri-monthly, 11 semi-monthly, and 11 monthly.

Religion.—The Baptist Church claims over half the church population of the State, and then follows the Methodist Episcopal, South; African Methodist; Methodist Episcopal; Roman Catholic; Presbyterian, South; Cumberland Presbyterian; Disciples of Christ; and Protestant Episcopal. In 1900 there were 1,664 Evangelical Sunday-schools, with 11,967 officers and teachers, and 100,000 scholars.

Charities and Correction.—There is a State penitentiary at Jackson, where the prisoners are employed at farm labor. There are State hospitals for the insane at Jackson and Meridian. The State Deaf and Dumb Institute for white and colored, and the School for the Blind (white) are located at Jackson. There are hospitals supported by the State at Vicksburg and Natchez.

Manufactures.—There were 4,772 manufacturing establishments in Mississippi with an invested capital of \$35,807,419, in 1900. The gross value of products for 1900 was \$40,431,386. The value of materials purchased in a partly manufactured form was \$12,618,054. The difference, \$27,813,332, is the net value of products, and represents the increase in the value of raw materials resulting from the various processes of manufacture.

The following table shows the census figures for the leading industries for 1900:

INDUSTRIES	Number of establishments	Capital	Wage Earners	Value of Products
Total for leading industries for State.....	3,205	\$29,210,084	20,072	\$31,372,442
Increase, 1890 to 1900.....	2,242	19,415,871	10,488	18,733,908
Per cent of increase.....	232.8	198.2	109.4	148.2
Per cent of total of all industries in State.....	67.2	81.6	76.0	77.6
Cars and general shop construction and repairs.....	9	741,753	1,534	1,326,401
Cotton ginning.....	1,901	3,553,853	2,422	2,214,949
Cotton goods.....	6	2,209,749	1,675	1,472,835
Flouring and grist mill products.....	225	225,335	208	932,816
Lumber and timber products.....	844	17,337,538	9,676	15,656,110
Lumber, planing mill products.....	34	631,553	748	1,315,775
Oil, cottonseed and cake.....	41	3,711,930	1,521	6,681,121
Turpentine and rosin.....	145	798,373	2,288	1,772,435

dren of school age numbered 558,800; the enrollment in public schools, 360,177; and the average daily attendance, 201,593. There were 8,156 teachers; 6,687 public school buildings and school property valued at \$1,636,955. The receipts for the year amounted to \$1,364,438, and the expenditures to \$1,306,186. For higher education there were 91 public schools, 46 private secondary schools, 7 public and 11 private normal schools, 9 colleges and universities for men, and 12 colleges for women. The men's colleges include Mississippi College, Clinton; Jefferson College, near Natchez; Rust University, Holly

Lumber and timber products form the leading industry, with cottonseed-oil and oil cake second. In 1900, Meridian had the mill of largest capacity, and Greenville the greatest number of establishments. Two establishments, one at Jackson and the other at Meridian, refined as well as expressed the oil. It is claimed that a Mississippian, John Ross, in 1801, made the first written suggestion that oil be expressed from the cottonseed and prophetically named its uses. The first mill in the United States was erected at Natchez, Miss., in 1834.

Cotton ginning has undergone a remarkable

MISSISSIPPI

development during the decade 1890 to 1900, and now holds third place among the manufacturing industries of the State. There were 1,901 establishments reported in 1900, with 2,422 wage-earners, and the receipts for ginning amounted to \$2,214,949. In 1890 there were only 130 establishments reported, with 547 wage-earners, and the receipts amounted to \$130,387. The increase in these receipts during the decade was \$2,084,562, or 1,598.7 per cent.

Transportation.—The total length of railroads within the State in 1901 was 2,955 miles, of which 128 miles were completed during the previous year. The most important lines are the Illinois Central, the Yazoo & Mississippi Valley, the Southern, the Louisville & Nashville, the Kansas City, Memphis & Birmingham, the Mobile & Ohio, the Alabama & Vicksburg, and the New Orleans & Northeastern. Vicksburg, Greenville, and Natchez are principal ports on the Mississippi River, and Pascagoula and Biloxi on the Gulf of Mexico.

History.—Hernando de Soto (q.v.) and his companions first visited the Mississippi region in 1539. They made no settlements, however, and the death of the leader in 1542 put an end to the expedition. In 1682 La Salle descended the Mississippi, took formal possession of the adjacent country for the king of France, and called it Louisiana. In 1698 M. d'Iberville was authorized by the French king to colonize the regions of the lower Mississippi. He landed near Ship Island, and from this point, setting out with two large barges, explored the coast, discovered the mouth of the Mississippi, reaching the bend at the mouth of Red River, and returning to Ship Island erected a fort at the Bay of Biloxi, about 80 miles east from the site of New Orleans. He then embarked for France, leaving the fort in command of his two brothers, Sauvolle and Bienville. In December 1699 Iberville returned, and soon after built a fort on the banks of the Mississippi. In 1700 the Chevalier de Tonty arrived at Iberville's fort with a party of Canadian French from Illinois. Availing himself of De Tonty's knowledge of the country, Iberville despatched a party under his lead to explore the river and its banks. They ascended to the Natchez country, 400 miles above the French fort, and here selected a site for a fort, and called it Rosalie. A settlement was also made in 1703 on the Yazoo River, which was called Saint Peter's. The colonies thus planted grew but slowly, and New Orleans, being founded soon after, drew off a large portion of the colonists from the interior, besides attracting the new immigrants. In 1728 the settlers and the Natchez Indians became enemies, and as a result the latter massacred the settlement and over 200 persons were killed and 500 taken prisoners. The captives were, however, released, and new and stronger forts were erected. Aided by the Choctaw tribes, the French succeeded in destroying the tribe, the greater part of which fell in battle. In 1733 the colony went to war with the Chickasaws, allies of the English, and the conflict continued for several years. There was a peace, followed in 1752 by another Indian war.

In 1762 when Florida was ceded to Great Britain, that part of the present State lying south of a line drawn eastward from the mouth of the Yazoo River (practically from Vicks-

burg) was claimed to be part of Florida; and when in 1781, Spain conquered Florida, that part of the State came under Spanish rule. In 1798 the Mississippi Territory was created by Congress. Its boundaries were the Mississippi River on the west, the 31st parallel on the south, the Chattahoochee on the east, and a line drawn from the mouth of the Yazoo due east on the north. The Territory having been surrendered to the United States as part of Georgia, the consent of that State had been previously obtained to the establishment of a territorial government. This consent was followed in 1802 by the further cession by Georgia of all her lands south of Tennessee, and these by an act of Congress in 1804 were attached to the Mississippi Territory, which thus comprised the whole of what are now the States of Alabama and Mississippi from the 31st to the 35th parallel. The territory between the Pearl and the Perdido rivers was added in 1811, having been wrested from Spain under the plea that it had originally formed a part of Louisiana. In March 1817 Alabama was separated from Mississippi and organized under a territorial government of its own; and 10 December of the same year Mississippi was admitted into the Union as an independent State. In 1861 it passed an ordinance of secession, took a prominent part in the Civil War, and finally in January 1869 was readmitted to representation in Congress, after ratifying the 15th amendment. The principal battles fought here during the Civil War were those of Corinth, Baker's Creek, Holly Spring, Iuka and the siege of Vicksburg. Amendments to the State constitution were made in 1875 and 1877. The State has had four territorial governors, two provisional governors, one Union Democrat, three Republicans, and 28 Democratic governors.

EDWARD MAYES,

Author of Educational History of Mississippi.

Mississippi, University of, the State university chartered in 1844 and first opened in 1848, situated near Oxford. During the Civil War (1861-5) all exercises were suspended, and two members of the faculty appointed custodians of the University property. In 1872 the present organization in separate schools with optional studies was adopted, and courses leading to other degrees besides bachelor of arts were offered; in 1881 the law school was established. There are, therefore, now two departments: (1) The Department of Science, Literature and Arts; (2) The Department of Professional Education. The first includes 25 schools grouped into dis-

MISS. AGRICULTURAL COLLEGE—MISSISSIPPI LEVEE SYSTEM

tinct courses or lines of study, providing instruction in the languages, history, science, mathematics, political economy, philosophy, pedagogy and engineering; the degrees conferred are bachelor of arts, bachelor of science, bachelor of philosophy, bachelor of pedagogy, bachelor of mining engineering, bachelor of electrical engineering, and bachelor of civil engineering; there are also post-graduate courses in this department leading to the degrees of master of arts and doctor of philosophy. The second department included in 1903 only the law school. In 1900 the summer term of the University was begun. In 1882 women were admitted to all classes upon the same conditions as men, but were not allowed to lodge on the campus; in 1902 a special home for women students was erected. In the same year additional dormitories were built for men. The library has a special building of modern architecture, and in 1903 numbered 17,000 volumes; there is also a law library of about 2,000 volumes in the law building. Until 1880 the University was supported by annual appropriations of the legislature; since that time the income has been derived from the Federal grant of land, a second township being added to the original grant in 1894; the State has given occasional appropriations for buildings and improvements; in 1903 the income amounted to \$45,000. In that same year the students numbered 260, the faculty 13.

Mississippi Agricultural and Mechanical College, founded in 1880, at Agricultural College, Miss. The regular four years' courses offered are the agricultural, mechanical and textile, leading to the degree of B.S., a short course (10 weeks for two years) is given in the winter; graduate courses are also provided; and there is a preparatory department. Women are admitted to all courses. The experiment station is connected with the college, and receives special Federal appropriation; and farmers' institutes are organized by the college and attended by members of the faculty; in 1902 23 such institutes had an attendance of 1,500. The college was endowed by the Federal land grants of 1862 and 1890, and receives also State and Federal appropriations; no tuition is charged to residents of the State; the income in 1903 amounted to \$115,510. The number of students in 1903 was 604; the faculty numbered 40.

Mississippi Bubble, a celebrated financial scheme projected by John Law (q.v.) at Paris in 1717. Law issued shares for a vast company to be called the *Compagnie d'Occident*, and to be engaged in the colonization and cultivation of the banks of the Mississippi. Reports skilfully spread as to gold and silver mines discovered in these parts raised in the people the hope of great gains. The company soon absorbed those of the Senegal and the East Indies, and took the new title *Compagnie des Indes*. Such were the hopes raised by this undertaking that the shares originally issued at \$100 were sold at 10, 20, 30, and 40 times their value. Law had promised to the regent that he would extinguish the public debt. To keep his word he required that the shares in this company should be paid for one fourth in coin and three fourths in *billets d'état* or public securities, which rapidly rose in value on account of the foolish demand which was created for them. In October 1719 the shares mounted as high as \$4,000. The

state took advantage of the popular frenzy to issue increased quantities of paper money, which was readily accepted by the public creditors and invested in shares of the *Compagnie des Indes*. This went on till the value of the paper money in circulation was more than three milliards, while the value of coined money was no more than 700 millions. Before this stage was reached Law himself, who had originated the idea of paper money, had endeavored to check the issue, but his efforts were unavailing. A catastrophe was now inevitable. About the end of 1719 the more prudent speculators began to sell out. In payment of their shares they received, of course, in great part, *billets d'état*, and with these bought gold, silver, diamonds, lands, or anything else having a real value. As the *billets* became depreciated such articles as tallow, soap, etc., were often bought at fabulous prices. Law struggled desperately against the fall in the value of the shares, but all his devices to check their downward course were futile or had only a temporary success, and when the state finally declared that it would receive no further payments in paper, he perceived that all attempts to bolster up the scheme were in vain, and made his escape from France (December, 1720). The affairs of the company were wound up by the state acknowledging itself debtor to the creditors of the company to the amount of \$340,000,000. The public debt was augmented by \$2,600,000 of "annual rentes."

Mississippi College, in Clinton, Miss., founded in 1826 under the auspices of the Baptists. It has preparatory and collegiate departments. The college courses lead to the degrees of A.B., B.S., and Ph.B. In 1902 the school had 10 professors and instructors, and about 300 students. The library had about 4,000 volumes; the property was valued at \$45,000 exclusive of the productive fund of \$42,000. The annual income was about \$15,000.

Mississippi Levee System, The. The need of a system of levees along the margin of the Mississippi River, in addition to the bank revetment and contraction dikes which are used in the bed of the stream for the improvement of navigation, is that the banks are below the level usually reached by high water. But as they are higher than the land more remote from the river, their overflow results in the submergence of all the lands in the alluvial valley.

The scheme for outlets which has been urged from time to time is impracticable above Red River, where no suitable sites exist, and is to be condemned below Red River, where alone it is possible, notwithstanding the immediate but temporary relief which it might give, because both theory and experience show that when a reduction is made in the size of a river flowing in alluvial soil, or the river is split in two, the smaller rivers gradually take greater slopes than the main river had, and, as the slope begins at the level of the sea, all points in the water surface above will therefore be higher in the divided river than they would have been in a single channel. Hence the relief would be temporary, and, after the time required for adjustment, flood levels would be raised. This would surely occur unless, as is probable, the outlet closed itself by the deposit of sediment. Reservoirs to hold back the floods have been proposed on the Ohio, from which

MISSISSIPPI LEVEE SYSTEM

tributary the Mississippi receives the largest contribution to its flood waters, but examination proves them to be too costly and dangerous to be practicable. The opportunities for reservoirs on the upper Mississippi are too limited to have any important effect on the floods of the lower river. It is possible that the scheme of irrigation, on the scale now proposed by the Government on the rivers draining the arid lands may have the effect of abating floods below.

The use of the levee then has been in practice the sole method of restraining the waters of the Mississippi. It began in 1718 when the people of New Orleans built in front of the city a levee three feet high to keep the river back from a fertile alluvial strip. The work progressed slowly up the river during French and Spanish occupation, and even after the Louisiana Purchase in 1803. With the single exception of the grant from the Federal Government of certain swamp lands in 1850, all work on the Mississippi levees until 1882 was done entirely by the States, with no aid from the central government; and this aid, indeed, was purely nominal, as the swamp lands granted had no commercial value and could not be converted into funds to further the construction of levees, but needed the very improvement consequent on the building of levees to make them salable. By 1882, the year of the great Mississippi flood, it had become evident, on the purely physical side of the problem, that the control in the lower course of the river of the drainage from 1,250,000 square miles was too great a burden for the seven riparian States below the junction of the Ohio. In that year the first small allotment was made for levees by the Mississippi River Commission, from the appropriation of \$1,300,000, made by Congress for the improvement of the Mississippi River. As far back as 1845, a convention held in Memphis, Tenn., urged that "the improvement and preservation of those great rivers" (that is, Mississippi and Ohio) "are deemed impracticable by the States or individual enterprise, and call for the appropriation of money for the same by the General Government," a resolution passed with John C. Calhoun in the chair and by a body of representative State's Rights men, strict constructionists, and natural opponents of the doctrine of internal improvements. From 1882 in every River and Harbor Bill until 1896, from the appropriations for the improvement of the River, the Mississippi River Commission were allowed to make only such allotments for levees as they considered would benefit navigation. Since that year the bills have made specific provision for the building of levees. Between 1882 and the close of the fiscal year in 1903, the General Government's appropriations have amounted to a little more than \$18,000,000, by far the most of it granted since 1891. The States and levee districts up to 1903 spent more than \$40,000,000. This amount was raised by heavy State taxes. Thus, in Louisiana by special taxes in the alluvial counties on all real and personal property and products, and by a general tax of one mill on all property in the State, about \$2,000,000 is raised annually. This sum exceeds the average granted by the Federal Government for work throughout the whole valley each year. Besides this the State, by its Constitution, grants the free right of way for levees. It has also constructed and maintains

about 600 miles of levee on its interior streams without Federal or other assistance. Hence it will be seen that the States have borne much more than their share, and that the appeal for increased appropriations made to Congress by the Inter-State Mississippi River Improvement and Levee Association in 1903 at its convention in New Orleans is a reasonable one. The River Commission estimates that rather more than 94,000,000 cubic yards of levees will be necessary to complete the system; the estimated cost is not more than \$20,000,000, and the suggestion of this convention was that the appropriation of Congress be so increased that all this work can be completed in six or seven years.

The justice of such a claim is borne out by the success of the work already done. Any argument based upon this will be of greater force than the mere showing of facts signifies, since these results were attained with imperfect means, that is, with incomplete levees. The floods of 1897 and 1903 furnish a means of comparison. The 1903 flood was greater than that in 1897, but it broke levees only in six places, between Cairo and Red River, whereas the lesser flood of 1897 made 38 breaks. The earlier flood broke down over nine miles of levee; the latter only two and one half miles. The gain due to the levees constructed in these five years is apparent, and it seems logical to argue that upon the completion of the system crevasses will become at least as infrequent as shipwrecks, fires, or railway catastrophes. To some such conclusion the following figures point: the area overflowed in 1903 was 8,000 square miles out of a total of 29,000 square miles liable to overflow. Of these 8,000 miles, 3,000 was from back water through the openings left for the confluence of the tributaries. This may be reduced one third, but cannot be entirely prevented. About 2,000 square miles were overflowed from the present incomplete extension of levees and only 3,000 miles of inundation in 1903 resulted from the failure of the system as far as built. So that, throwing out the area (about 2,000 square miles) which could not be protected by a levee system, no matter how much it was perfected, it is evident that the present levees saved from inundation all but 3,000 square miles out of the 27,000 square miles which are the actual measure of efficiency of the present system. In brief, in its present incomplete condition the Mississippi levee system in a great flood has an efficiency of more than 85 per cent. In years of ordinary high water it approaches 100 per cent.

These figures, which were presented to the Mississippi Levee Convention in 1903, are the more remarkable from the fact that a part of the work has been in the hands of States and Levee Districts, the contracts having been placed by them and the work done after their designs, and that another part has been done by the Federal Government, with all the consequent opportunities for friction and for lack of harmonious plan. It is to be noted, however, that no such disagreements or incongruities as might have been expected have occurred—there having been, in fact, a remarkable concert of purpose and action between the officers of the United States Engineer Corps and the engineers of the local levee authorities who have had executive charge of the work. The designs and

MISSISSIPPI LEVEE SYSTEM

specifications prepared by them for levee work have been substantially the same, the controlling purpose having always been to build embankments as rapidly as means become available, at least two or three feet higher than any previous flood water, and of such width and section as experience has proved necessary for stability.

The levees built in the earlier period of construction were frequently low in grade and deficient in section; but, at least since the increase of means for the work due to the aid of the General Government, few levees have been designed or built with grades less than two feet above any previous flood level, or with a less width of base than seven times their height. The standard section approved by the Mississippi River Commission for levees not exceeding 12 feet in height, has a crown, or width on top, of 8 feet, with transverse slopes on both sides of 1 vertical on 3 horizontal. When above 12 feet high a "banquette," or additional base, on the landward side is to be added, extending from a point 8 feet below the grade, or level of the crown, with a slope of 1 on 10 for 20 feet and thence with a slope of 1 on 4 to the ground line; but in general cases this banquette is omitted until the whole line is built to a grade 3 feet above the highest known water. The ground on which the levee is to be built is cleared of perishable material and plowed or spaded, and trees or stumps are grubbed by the roots and one or more search ditches—usually called "muck ditches"—are dug along the line to discover and cut off roots or buried logs. In many of the ancient levees these precautions were either omitted or imperfectly carried out, and in some cases much trouble and danger have resulted from the decay of such material left under these older levees. The embankment is generally made with earth taken from pits on the side toward the river, 20 to 40 feet from the base. The work is nearly always done under contract, by the cubic yard, and formerly was almost entirely executed with spades and wheelbarrows, but now quite as generally with wheeled scrapers. A few levees have been built with power-driven machinery, and it appears probable that such tools and appliances will be more extensively used in the future.

At present there are 1,490 miles of levees reaching from near Cairo, Ill., to Fort Jackson, La., nearly 80 miles below New Orleans. These are continuous, with the exception of gaps at the mouths of the Red, Yazoo, Arkansas, White and Saint Francis Rivers, to allow their junction with the main river. Through these gaps, in season of flood, the waters back up into the tributary basin, overflowing as much as 2,904 square miles now unprotected. The ultimate plan is to close all of them as nearly as possible.

The location of levee lines is necessarily governed to a large degree by the means available for building them. As the land is generally highest on the immediate banks of the river, levees located as close to them as possible are evidently smaller and less costly than those built further from the river on lower ground. But as the banks are more or less subject to erosion and caving in all concave bends, it becomes necessary to place the levees well back from such banks in order to give them permanency. The rate of recession in the past in any particular bend may indicate the probable position of the

river bank at a future date and thus determine the expectation of life for a given levee location. It has been a common practice of late years to locate them around caving bends, when time and means were available, so as to give them an expected life of not less than twenty years. But the rate of caving in any bend is extremely variable, and the locus of its maximum often still more so; and hence the life of a levee, as limited by the encroachment of caving river banks, is a matter of uncertainty, however carefully its lines may have been projected; for whenever they are reached by the caving of the river banks they, of course, fall into the stream with the ground upon which they stood. It is estimated that for the past eight years, the yardage annually required to close gaps thus occurring has been about one and a half per cent of the contents of the system as existing. With more ample funds for immediate use the margin between the caving banks and levee locations might, perhaps, be economically increased to give them a probable life much greater than 20 years around almost any bend. Indeed a large part of the line is so located as to appear beyond danger from caving banks for centuries; but sooner or later they must be threatened in many places, however located. The only remedy for this is the revetment of the river banks in such a manner as to prevent erosion and hold them in fixed position. This bank protection would often cost as much as \$150,000 per mile, where the average cost of a levee might not be more than \$30,000 per mile.

The contention that the confinement of flood waters to the path of the river induces deposits in its bed so that the channel becomes thereby filled and obstructed is not borne out by experience, nor by the innumerable soundings made for many years past by the Delta Survey and the Mississippi River Commission. Moreover, it is not consistent with the result of observation on smaller streams—Red River, for instance—where flood waters have been confined between levees, and the width and depth of the channel coincidentally increased, and the flood heights reduced. When the flood waters rise to the top of the natural banks of the river they may then overflow in a thin sheet without materially increasing the flood height in the river. But when this overflow is restrained by artificial banks, or levees, the water must rise higher. The extent of such rise, however, is not at all in like proportion to the volume of discharge. As the water rises the slope to the outfall increases, and also the larger channel occupied opposes a less ratio of frictional resistance to flow than the smaller channel. There is, therefore, a limit to the height of floods when confined between levees depending, when other conditions remain constant, upon their volume. There is reason to believe that the levee system of the Mississippi River as now designed, and under construction, will have a grade and height sufficient to restrain the largest flood volumes that can be expected to come down the river.

A strong attempt to make the question of increased Federal appropriations for the Mississippi levees a national issue naturally followed the passage of the Irrigation Bill, and was voiced in the Levee Convention held in New Orleans, 27–28 Oct. 1903. The Convention urged that the levee was the only solution of the diffi-

MISSISSIPPI RIVER

culty in the States on the lower Mississippi, no matter what a system of reservoirs and dams might accomplish on the upper courses of the river; argued that the protection and reclamation of land in the South was quite as clearly a case for governmental aid as the reclamation and improvement of arid lands in the West; and estimated that 20,000,000 acres of swamp land could be reclaimed by levee protection and made fit for the production of cotton, rice, cane and maize, at a total cost of \$3 per acre; that the levees could be maintained for less than ten cents per acre, and that the work was already two-thirds completed.

H. B. RICHARDSON,
Chief State Engineer of Louisiana.

B. M. HARROD,
Member Mississippi River Commission.

Mississippi River (Ind. *Missi Sepe*, "father of waters," "great river"), the main stem of the greatest drainage system of North America, and one of the greatest in the world (1,257,000 square miles); draining the entire western slope of the Alleghany-Appalachian range, and all the eastern slope of the United States Rockies save a small southern portion, with all between—19 States and 2 Territories in all, from New York to Montana, but narrowing considerably in the lower basin. The Mississippi extends nearly the entire length of the United States, from within 100 miles of Canada to the Gulf of Mexico, in a water course of about 2,550 miles, varied slightly by the lower river's bends and cut-offs; and forms the boundary, total or partial, of 10 States—Minnesota, Iowa, Missouri, Arkansas, and Louisiana, on the west, and Wisconsin, Illinois, Kentucky, Tennessee and Mississippi, on the east. It has on its banks four cities with from 200,000 to 600,000 inhabitants (Saint Louis, New Orleans, Saint Paul, and Minneapolis), and 17 others of over 10,000—Winona, Minn.; La Crosse, Wis.; Dubuque, Clinton, Davenport, Muscatine, Burlington, and Keokuk, Ia.; Rock Island, Quincy, Alton, and Cairo, Ill.; Hannibal, Mo.; Memphis, Tenn.; Vicksburg and Natchez, Miss.; and Baton Rouge, La. It is navigable precisely 2,000 miles (at present) from its mouth to Minneapolis (Falls of St. Anthony), though the end of regular navigation is St. Paul, 13 miles below; and is brokenly navigated by smaller steamers to Leech River, 415 miles farther on, along different reaches. It has about 100,000 tributaries, 240 large enough to figure on small-sized statistical charts, 45 of them navigable for distances varying from 2,300 to 50 miles, and aggregating some 15,700 miles of inland navigation; steamers can go upon it and its tributaries some 4,000 miles east and west without breaking bulk—from Great Falls, Mont., on the Missouri, to Olean, N. Y., on the Allegheny. The greatest of the affluents, the Missouri, is usually considered the main stream, being about 1,600 miles longer than the upper Mississippi above the mouth (4,200 miles from the Gulf, the longest river course on the globe), having a basin more than three times as great, and discharging a considerably larger volume of water annually; nevertheless the upper Mississippi has so much steadier a flow—the Missouri shrinking at low water to 1-48 the volume in flood, and practically unnavigable then—that the former as between the two maintains the permanent navigability

of the joint stream, and is justly enough held the main body in popular estimation, besides that the axial valley is continuous. Moreover, the Ohio with its great rainfall (41.5 inches, against 35.2 for the upper Mississippi and 20.9 for the Missouri) discharges far more than either, and if that were valid ground, should itself be held the main stream.

The chief tributaries of the lower Mississippi are as follows, in order of contribution to the volume of water in the lower river: Ohio, 1,300 miles long (to source of Allegheny); width, 1,200 feet at Pittsburgh, 3,000 at mouth; basin, 207,111 square miles; annual discharge, about 5,000,000,000,000 cubic feet; per second, 158,000. Missouri, 2,908 miles long; width, 1,500 feet at Fort Benton (head of large-steamer navigation), 3,000 at mouth; basin, 527,600 square miles; annual discharge, 3,780,000,000,000 cubic feet; per second, 120,000. Upper Mississippi, 1,330 miles long; width, 1,200 feet at St. Paul (head of large navigation), 5,000 at junction with the Missouri; basin, 179,635 square miles; annual discharge, 3,300,000,000,000 cubic feet; per second, 105,000. Arkansas, 1,514 miles long; width, 1,500 feet at Fort Smith (head of large navigation), and about the same to its mouth; basin, 184,742 square miles; annual discharge, 2,000,000,000,000 cubic feet; per second, 63,000. Red, 1,200 miles long; width, widely varying from log dams, etc.; annual discharge, 1,800,000,000,000 cubic feet; per second, 57,000. The three next greatest basins are the White, Yazoo, and St. Francis. The total annual discharge, including three outlet bayous, is 21,300,000,000,000 cubic feet, or 675,000 per second.

The following are the distances from the farthest sources on the main stem to the chief landmarks on its course, and the mean-water elevations above sea-level at the end of the reaches:

	Dist., Miles	Elev., Feet
Mississippi Springs, above Itasca, and 6 1/2 miles from outlet.....		1535
Outlet at Itasca to outlet at Winnibigoshish Lake	114	1292.2
To Falls of St. Anthony (Minneapolis)	546	782
To St. Paul, Minn.	559	680.5
To La Crosse, Wis.	715	621.2
To Prairie du Chien, Wis.	787	597.5
To Dubuque, Ia.	849	578.2
To Rock Island, Ill.	957	533.7
To Burlington, Ia.	1,039	505.1
To Keokuk, Ia.	1,086	472.3
To Quincy Bridge, Ill.	1,127	453.8
To Hannibal, Mo.	1,147	444.9
To mouth of Illinois River.....	1,249	399.4
To St. Louis, Mo.	1,288	384.8
To mouth of Ohio River (Cairo, Ill.)	1,470	275
To Memphis, Tenn.	1,695	201
To Natchez, Miss.	2,177	40.5
To Baton Rouge, La.	2,310	18.5
To New Orleans, La.	2,435	8
To Fort St. Philip, La.	2,509	3
To head of Passes	2,529	1.8
To Gulf	2,546	
(Or 2,553 miles from ultimate sources.)		

The "source" of a great river is often a term of little import, as its waters may gather from the drainage of a large district; but taking it in its current sense, of the ultimate reservoir of its farthest extension, the Mississippi rises in the basin draining into Itasca Lake (q.v.) in northern Minnesota. Into the west arm flows

MISSISSIPPI RIVER

from the heights, through a couple of small ponds, a stream of considerable power and fullness, called by its discoverer Nicollet the "Infant Mississippi," and now confirmed as such so far as there is one ultimate stream; and out of it, from the north arm, flows the Mississippi. Nicollet in 1836 found it 16 feet wide and 14 inches deep at the outlet. Government Commissioner J. V. Brower in 1893 found it 50 feet wide and 3 or 4 deep in mid-channel, with a muddy bottom, and a current of about two miles an hour. As the current increases, it narrows to some 30 feet; is filled with debris, shoals, and boulders; and for some distance down the stream, free passage with canoes is impeded by reeds, flag, and water grass. It continues northward with slight falls and rapids, to Lac Travers or Bemidji, about 10 miles long by 4 wide, set in a basin surrounded by forested hills and with a beach of perfectly white sand. Thence it issues on the east, and for 25 miles southeastwardly brawls over a series of rapids, from whose foot it flows in a clear even stream 120 feet wide and 4 or 5 deep to Cass Lake, twice as large as Bemidji; thence on the east six miles to Winnibigashish, still larger, whence it issues again on the east 172 feet wide, and as before grows narrower, deeper, and of swifter current as it drains the marshes and meadows below. Just above the junction with Leech River, the outlet of the noble Leech Lake, the largest in this region,—25 by 15 miles,—it strikes a bed of sandstone with a fall of 20 feet in one sixth of a mile, and is ruffled into rapids called the Falls of Pokegama, in a channel 80 feet wide. This is about 130 miles from the source; small steamers run to the foot of the rapids. Thence it runs crookedly with a general south trend, about 120 feet wide, through hardwood forests, swamps, and sand-hills, covered with glacial gravel and boulder drift. From the entrance of Swan River to that of the outlet of Sandy Lake there are six rapids; the latter lake has a small stream running from a small pond to the eastward, not far from Saint Louis River, emptying into Lake Superior at Duluth, and forms the old canoe route from Minnesota to the Great Lakes. Thence to the entrance of Pine River, about 150 miles from the Pokegama Falls, it has numerous rapids, and is broad enough to enclose several islands; it receives several smaller tributaries; and the powerful Crow Wing River, 47 miles below Pine River, also fed from a district of lakes, contributes almost as much volume to the joint stream as the Mississippi itself. At the Sauk Rapids, a mile long, 133 miles below the Crow Wing, and at the entrance of Sauk River, begin the first rocky banks, of Potsdam sandstone, extending down to Rock Island.

At the Falls of Saint Anthony, 80 miles below, the river descends about 65 feet in three fourths of a mile, forming rapids interrupted in the middle by a precipice 18 feet high; over which the river, now 1,200 feet wide, formerly plunged in a cataract of great beauty and fame. An island divided it into two channels, the western being the larger. Here the water-power has been used to build up the immense manufacturing interests of Minneapolis, and the falls are no more, as will perhaps be the fate of Niagara. Thirteen miles below, a convenient landing has established Saint Paul as the head of continuous navigation for large steamers, and

made it the great wholesale distributing point for the Northwest, and onward the valley is richly fertile, very beautiful, and often of much grandeur. Below Saint Paul the river widens into the island-studded "Lake" Pepin. From Davenport, Ia., 943 miles from the source, to Rock Island, 14 miles below, there are rapids of 22 feet fall, formerly obstructing the navigation; the government has now cut a channel in the solid rock. The formation of the bed is peculiar, it consists of stratified limestone, crushed into folds which form a series of six or seven parallel bars across the channel, one to three miles apart. From this point onward, the formation is Carboniferous, and the banks rise into picturesque rocky bluffs sometimes 300 feet high, as far down as nearly to the beginning of the alluvial region, 140 miles below Saint Louis. At the mouth of the Des Moines River, 130 miles below Rock Island, is another rapid of 24 feet fall, now avoided by a ship canal; and between Muscatine and Keokuk is one 12 miles long, with 23 feet descent. Nearly 200 miles below Keokuk the first great change comes to the river. Into this clear placid stream is poured a swift muddy red torrent, at high water of far greater volume than its own, that of the enormous Missouri, creating turbulent eddies, and for many miles flowing side by side with the white northern stream without mixing of waters. The bends and winds of the river, making the current cross from side to side, finally mingling them within 100 or 150 miles. Not quite 200 miles farther on, comes in the mighty Ohio, with a volume over two thirds as great as that of the other two united.

But 30 miles above here, and three miles above the great geological landmark of Cape Girardeau, Mo., begins a still greater change: the vast northern upland, mainly elevated rock with a moderate soil covering it, which has been drained by the river, ceases. The remaining 1,100 miles of its valley is the creation of its own silt; through which it meanders in deep curves and loops and narrow horseshoes, shifting its channel capriciously, continually building up one side and cutting away the other, but rarely twice the same side. Cape Girardeau is an ancient headland of an ancient ocean, into which the silt-laden river poured its deposits as the present river does into the Gulf, and which has receded, leaving more than 1,000 miles of the garden of the world. And the relation of the river to its bottoms is reversed also. From the Falls of Saint Anthony to the end of the uplands, are deep strips of bottom land overflowed at high water; but except at such periods they are above the river. But in the lower bottoms made by the river itself, the surface of the latter is normally *above* that of the bordering lands. The friction of the current on the sides and bottom causes the water held back to keep depositing fresh layers of the heavier sediment on the edges and in the channel; so that as the depth of water remains the same, and the channel continually shallows, the surface of the water must rise, and would at last empty itself did not the same process elevate its retaining walls. The river therefore runs in a groove, cut into a ridge considerably above the surrounding country, its surface much higher and its bed much lower than the region for many miles back; it slopes away with a gradient at first of about seven feet to the mile, de-

MISSISSIPPI RIVER

creasing regularly to the outer edges of the flood plain—which at the Ohio is about 10 miles wide, and 50 to 70 in lower Louisiana, widening to 150 at the Delta—and ending at about six inches per mile in the swamps and bayous at the outer edge. The natural method of discharging the waters at flood seasons is to spill over the banks and flood the adjacent country, part of the waters flowing off through semi-river channels (bayous) in the soft earth, the rest remaining in pools and swamps and gradually evaporating; and the attempt to keep it in the same channel which suffices for low water, to comport with the needs of civilized occupancy, has produced an excessively costly battle with nature, of which the success is by no means yet assured or assurable.

The junction of the Red introduces us to still another phenomenon. That great river formerly discharged its main waters to the Gulf through the Atchafalaya "Bayou," roughly parallel with the Mississippi; but that and the Mississippi both sent their surplus waters through an amazing network of lesser bayous, which still penetrate southern Louisiana with thousands of miles of navigable channels. The head of the Atchafalaya silted up and became choked with logs and rubbish, and the Red opened a channel into the Mississippi; late in the 19th century the government dredged out the head of the bayou to make a navigable channel; it rapidly widened to a great river, became again the main channel of the Red, and threatened to ruin a great district of fertile plantations; so that works had to be undertaken to prevent its enlargement. As we approach the place where the Mississippi plain merges in the great coastal plain of the Atlantic, the surface grows lower and the soil spongier; and the river (which above the Missouri is about a mile wide, thence to the Red half a mile to a mile, with occasional reaches of a mile and a half, and below the Red narrows to a width of about 3,000 feet, which it retains with curious persistence) widens to about a mile and a half and enters the Gulf—through the Delta, a quaking, impassable, finally half liquid salt marsh, land in process of making—by three great arms or "passes," of which two ramify still further. These are known as the Southwest Pass, the South Pass (with two arms near the Gulf), and an eastern arm soon dividing into North Pass and Pass à l'Outre.

It should be said, however, that these alluvial bottoms do not quite monopolize the space from the Ohio to the Gulf. Here and there on the east bank there are spots where high solid ground, old capes and peninsulas of the antique ocean, comes down to the river side; as at Columbus, Ky., Randolph and Memphis, Tenn., Vicksburg, Grand Gulf, and Natchez, Miss., and Baton Rouge, La. With one exception, each of these spots has been utilized as a considerable road for the commerce of the interior to the great waterway.

Improvements of the River.—These are broadly divisible into two classes: those designed to improve navigation, and those designed to prevent overflows. The one, therefore, has for immediate object the deepening or equalizing of the permanent channel, the other the raising and strengthening of the banks. To some extent both require common methods, as in stopping off overflow channels; often they are antagonistic, navigation being improved by narrowing

the channel, liability to breakage of banks decreased by widening it. The methods of the second have been more used to achieve the first than some engineers think judicious.

At high water the navigation problem presents no difficulty; work should therefore be concentrated on low-water conditions. It must be said that so far, all the notable good, except in case of the jetties at the mouth, has been accomplished by the old-fashioned methods of blasting and dredging; aided by superior modern appliances; and even the jetties would fail of their work without constant dredging. It is obvious that as no more water in total can be furnished to the river, there are but three possible methods of obtaining more at a given spot and time: first, to pond a portion of the flood waters in reservoirs, sluicing it out at low water; second, to concentrate the water where it is needed; third, to level the bed of the stream so that there shall be no undesired ponding behind shoals and bars, and no rock projections. The first has been given up as entirely impracticable: no conceivable artificial reservoir can supply enough water to keep a great river full. The second has two methods. One has been applied with excellent success, not to the main river but to the Ohio, where six locks and movable dams, each costing \$800,000, creating pools from place to place, have given six feet of water for some distance below Pittsburg; and 12 more are in contemplation, to extend the system to Marietta. This is the canal system, and a rational one: it may yet be applied to the great river. The improvement of the Missouri in like manner has been discussed; but the excessive lowness of the water in the dry season—but 15,000 cubic feet per second—with the enormous amount of sediment brought down at high water, 1-39th its weight against an average of 1-265th, make it almost hopeless. Another and older method, also excellent, is to narrow the channel and so deepen the available water. As it would not be practicable to build thousands of miles of artificial river channel, effort must be directed to improving the natural one. To this end, it is narrowed by closing off side channels around islands, etc.—stopping up the heads; diking off small bays and inlets; strengthening caving banks; and obstructing the side current by solid spur dikes, set obliquely out into the stream nearly to the channel line. After the entrance of the Missouri, the mass of sediment furnishes a new and effective weapon. Between here and Cairo hurdles of piles and brush are laid along the banks, jetty fashion; the sediment packs into the brush and speedily becomes solid, and the results in creating new banks to narrow the channel have been most gratifying, besides reclaiming large tracts of overflowed bottom lands. Caving banks are protected by mattresses (see JETTIES for their construction); the depth of water being slight, they can be made lighter than in the lower river. Below Cairo the work is of the same nature, but more difficult from the volume of water and the alluvial lands easily crumbling. Here the channel is sought to be narrowed, where it exceeds about 3,500 feet, by mattresses from 800 to 2,000 feet long, and 200 to 300 feet wide, weighted down with rubble stone. But the immense weight of the water, which may be from 60 to 100 feet deep at flood, has forced their continual increase in weight and strength of construction.

MISSISSIPPI RIVER PROBLEM

The brush and small saplings have been replaced by fascines (solid rods tightly withed together), the binding poles by strong wire; the cost per foot of bank protection has trebled in the last 25 years, rising from about \$10 to \$30. For closing off side channels and water-courses, rows of piles are driven in, 8 or 10 feet apart and the rows 20, and the upper row interwoven with brush. Caving banks are graded down to a slope, and faced with mattresses; of late, however, rubble stone has been used with better success. On the lower river, where stone has to be brought from long distances, concrete has been experimented with.

Another system, however, has been tried for many years at enormous cost, and is still an experiment—that of levees. (See **MISSISSIPPI LEVEE SYSTEM**.) Formerly, under the slave system, each planter along the rivers liable to overflow had rude dikes erected for himself; the importance of the work to neighborhoods led to common town action, then to county and State action. These levee systems, of course, were broken through in floods, but the water rose only to its natural height in the channel, and soon subsided; and to furnish absolute security against overflow would cost not only an enormous sum, but would exceed a hundred-fold the capital value of the districts imperiled. When in 1879 Congress appointed the Mississippi River Commission, it forbade them to consider the protection of lands from overflow as part of their work. Nevertheless, a majority of the Commission believed that the levee system could be used efficiently to improve navigation; and estimated that \$11,443,000 below Cairo would furnish a complete protection for the banks and double the depth of permanent river channel, by the natural scour of the water as with jetties. Since then, the National government and the States (about half each) have spent over \$28,000,000, and it is estimated that \$22,000,000 more will be needed to complete the work; the channel has not been improved at low water, except by means not connected with the jetty system; and the level of the river has risen with the levees, over six feet already, and estimated to ultimately reach 11 when the levee system has made a smooth solid bank all the way, with no places for overspill. These levees are from 8 to 14 feet high, with a width on top of 8 feet, and a side slope of $\frac{1}{3}$; and are intended to project three feet above high water, but need to be raised every few years as the river rises. There are now about 1,400 miles of continuous levees from New Madrid, Mo., 80 miles below Cairo, except for some 50 miles around Memphis, where there are gaps; and it is estimated that half of this will have to be made 14 feet high eventually. They have to be placed near the banks, to protect riverside plantations and avoid the slope away from the river; and very large amounts of them have to be replaced yearly from cave-ins.

The leveling of the channel bed has perhaps done more for navigation than all the others, except the movable dams. The blasting of a channel through the solid rock bed at the rapids between Davenport and Rock Island, and the cutting of a canal at the Des Moines Rapids, are permanent improvements. In the sand bed below the junction of the Missouri, the best work is steadily done by the pumping dredges, of which there are two between there and Cairo,

and nine in the lower river; most of these have a capacity of 1,000 cubic yards of sand per hour, which they suck in through long pipes. They cost on an average \$100,000 apiece, and \$20,000 a low-water season to operate. Their work can never be done, for the river constantly creates new tasks for them, by the same natural law that created the first one, and creates them in ever new places; but the hope of navigation rests on them. They attack a sand-bar when the water is falling, and cut a channel about 2,000 feet long and 250 feet wide, to a depth of three or four feet.

From St. Paul to the Missouri River, where at low water there is sometimes only two feet in the upper reaches, and 3 in the lower, there are good hopes of maintaining $4\frac{1}{2}$ feet; and 6 to Cairo, with an ultimate hope of 8, where now there is $3\frac{1}{2}$ or 4; 10 to Memphis, and 12 below for some distance. At New Orleans the water is deep enough for the largest ocean steamers; and in consequence of the jetties, vessels of 30 feet draft can now ply to foreign ports. See **JETTIES**.

FORREST MORGAN.

Mississippi River Problem. The control of the waters of the Mississippi so as to make the navigation of the river safe and so as to make the immediately surrounding country fit for agriculture is a great economic problem of more than merely local interest. The problem is national historically, for to the control of the Mississippi as much as to any other one thing the historical growth of the country is due. It is even more strikingly true that the problem is of national significance from the commercial point of view, simply because this vast river drains the richest territory in the world, 70 per cent of the area of the United States. The additional importance of the Mississippi as an artery of commerce after the digging of the Isthmian canal is evident, inasmuch as New Orleans will then be a port for Pacific trade. This city commanding a new commerce the regulation of the waters of the Mississippi will benefit very greatly, first, by making the river more thoroughly navigable, and second, by protecting the adjacent country, so that these rich lands can be utilized for the growth of cotton, rice, and cane, and that, at the same time, the railroads now being built between St. Louis and other western points by the 'Frisco road and by the Gould interests will be protected from overflows. In short perfect regulation of the waters of the Mississippi would mean to New Orleans safer communication by land and by water with the country for which the city ships abroad and larger crops to handle from the improved and reclaimed bottoms. The national importance of the control of the river and its safe navigation was outlined in the early 50's by Matthew F. Maury, who picturesquely phrased the almost universal commercial character of the territory it drained to the north and of that which it commanded at the south. Referring to an Isthmian canal, Maury said:—"And when there shall be established a commercial thoroughfare across the Isthmus the trade winds of the Pacific will place China, India and all the islands of that

MISSISSIPPI RIVER PROBLEM

ocean down hill also from this sea of ours. In that case the whole of Europe must pass by our very doors on the great highway to the markets both of the East and West Indies." He also stressed the great future agricultural value of the drowned lands in the Mississippi Valley ceded by the Federal Government to the States; and noted particularly that this access of new fertile soil to the tillable area of the South would particularly affect American supremacy in the cotton market of the world. If this was true in 1850 it is much more true now, for the increased natural wealth of the country lies very largely in the basin drained by the Mississippi; New England, New Jersey, Delaware, South Carolina, Florida, Arizona, Utah, Idaho, California, Nevada, Oregon and Washington are the only States that do not or will not depend for their prosperity on the prosperity of the States actually touching the Mississippi. That this preponderance of importance is not a mere matter of abstract physical geography may be seen from the following table showing the proportion of various interests in the Mississippi area as compared to the whole country:

	Total in United States	Total in the Mississippi area	Percentage of total in the Mississippi area
Population	75,994,575	62,166,099	82
Area, square miles.....	2,970,230	2,107,550	70
Improved acreage	414,498,487	374,313,897	90
Timber acreage	32,222,037	23,748,801	73
Railroad mileage.....	194,321	162,506	83
Farm products, value.....	\$4,717,069,973	\$4,154,233,789	88
Manufactures, value.....	\$13,010,036,514	\$9,850,075,296	75
Wheat, bushels.....	658,534,252	571,701,154	85
Corn, bushels.....	2,666,324,370	2,617,409,198	98
Cotton, bales.....	9,534,707	8,591,391	90
Tobacco, pounds.....	868,112,865	823,247,901	94
Hay, forage, tons.....	84,010,815	71,152,786	84
Coal, tons.....	269,881,827	266,150,899	98
Iron ore, tons.....	27,553,161	27,177,729	98
Spelter, tons.....	123,886	115,627	94
Lead, tons.....	230,090	139,835	60
Petroleum, barrels.....	63,362,794	59,263,220	93

The showing of this table of present statistics puts the national significance of the Mississippi problem beyond cavil, and it is to be borne in mind that the future, too, should be consulted. As the law that industries sooner or later get as near as possible to the source of raw material is carried out in America, this Mississippi area will inevitably grow faster than any other part of the country. If this entire section had, as it well may have 50 years hence, a mileage as great per square mile of territory as the present State of Ohio, it would possess 458,163 miles, that is more than twice the present mileage of the whole country. A proportional increase in agriculture and manufactures in the Mississippi area would mean annually 700,000,000 bushels of wheat, 8,000,000,000 bushels of corn, a total annual value of \$12,500,000,000 in agricultural products, and of \$40,000,000,000 in manufactures. The accomplished fact of the last two decades makes such prophecies possible. And the table given above cannot be gainsaid, no matter what the doubter may think of the forecast just outlined. The table certainly shows that what affects the Mississippi area is a matter of national importance, or to be more concrete that the Federal Government should bear the expense of improved navigation on the Mississippi, of protection against flood for the new railroads required

by New Orleans' increased shipping in the near future, of protection of farms and plantations along the river course, and of the reclamation of swampy lands adjacent to the river. This is certainly a great and an expensive work, but it would be a break with past tradition and precedent to refuse large appropriations for internal, commercial and industrial defense and offense, or to make the solution of this problem secondary to an increased army or navy list, for example; for the place in world politics taken by the United States is due primarily to agricultural and industrial supremacy. Looking at the question from this side it becomes evident that Mississippi River appropriations are of far too great importance to be merely a part of the Rivers and Harbors Bill; that these appropriations have been placed there is due to the unfortunate fact that the improvement of the navigation of the Mississippi has been treated as the sole item in the great Mississippi problem. As a matter of fact it is primarily and immediately no less important than the protection of riparian lands; and to make it the only end of appropriations, as was done with scarce an ex-

ception up to 1891, and very largely since, is to forget the value of the swamp lands with their rich alluvial deposits, which should be reclaimed, and also the new factor in the problem, namely, the demands of the railroads for protection. In comparison with the widespread significance of the Mississippi area, the arid lands of the West which are to be reclaimed by a national scheme of irrigation are small and unimportant. Sooner or later the bigger and more national problem will be settled in a national way. The remedies suggested are various. The levee (see MISSISSIPPI LEVEE SYSTEM) when perfected should protect the railroads and the plantations along the river, besides contributing something to the reclamation of long flooded land. But the levee does not go to the root of the matter. It may not be easier, but the result would be safer, if such terrible floods could be prevented, or partly checked. To accomplish this, or to lessen the volume of water in the lower course of the river, by striking at its upper waters seems theoretically and logically correct, but the practical means are unknown. No doubt the reforestation of the country adjacent to the head-waters of the Mississippi and its tributaries would partly accomplish this, but whether such reforestation itself could be accomplished is a question. Certainly

MISSISSIPPI SOUND — MISSOURI

this is not a speedy, though it may prove the ultimate solution; just as surely such a remedy cannot be applied save by the General Government. The apparent success of the Assouan dam in Egypt as a method of controlling floods and furnishing irrigation supply suggests that a great system of dams and reservoirs might assist in protecting and enriching the soil of the immediate Mississippi Valley. None of these schemes seems to promise any great improvement in the navigability of the Mississippi, which the levees have not greatly bettered, although many of them were constructed by government orders primarily for this purpose and not for protection.

RICHARD H. EDMONDS,
Editor 'Manufacturers' Record.'

Mississippi Sound, an arm of the Gulf of Mexico, extending along the coasts of Mississippi and Alabama from Bay Saint Louis on the east to Mobile Bay on the west and connecting with the latter by Grant's Pass. It is about 100 miles long, from 7 to 15 miles wide, and is formed by a chain of low, narrow, sandy islands, chief of which are Dauphine, Petit Bois, Horn, Ship and Cat.

Mississippian Series, in geology, a group belonging to the sub-carboniferous period and consisting of shales and sandstone beginning in southwestern Illinois, where they are 1,200 to 1,500 feet thick, running south through Indiana, Kentucky and Texas, and divisible into: the Kinderhook group, which includes the Louisiana limestone and the Knobstone sandstones and shales; the Osage group, comprising the various Burlington groups; the Saint Louis group, with thick limestone beds; and the Kaskaskia or Chester group, mostly limestone with shale and sandstone intercalated.

Missolonghi, mīs-sō-lōng'gē, or **Mesolongi**, mā-sō-lōng'gē, Greece, a northwestern town, capital of the nomarchy of Acarnania and Ætolia, on a marshy site near the Gulf of Patras. It stands on the edge of a lagoon, across which a causeway two miles long leads to the town. Near it, in 1823, a small Greek force under Marcos Bozzaris (q.v.) defeated a Turkish army, but with the loss of their patriotic general. In 1825-6 it stood a long siege by the Turks, latterly commanded by Ibrahim Pasha. A body of its defenders cut their way through the Turkish force and escaped; the remainder determined to sell their lives as dearly as possible, and when the Turks forced their way in, the powder magazine was exploded, thus overwhelming besiegers and besieged in one common catastrophe. Lord Byron died here, 19 April 1824; his heart was interred in the church of St. Spyridon, and a monument was erected by the Greeks in his honor. Here also is the tomb of Bozzaris. Pop. (1896) 8,394.

Missoula, mī-zoo'la, Mont., city, county-seat of Missoula County; on the Hell Gate River, and on the Northern Pacific railroad. It was founded in 1864, and in 1887 was chartered as a city. It is in an agricultural, mining, and lumbering region, and has some manufacturing interests. The chief industrial establishments are the railroad shops of the Northern Pacific, a brewery, bottling works, grain elevators, lumber yards, and stock yards. It is the trade centre for a large region, and ships grain, live-stock,

wool, fruit, and lumber. The Northern Pacific maintains Saint Patrick's hospital. Missoula is the seat of the University of Montana (q.v.) and the Sacred Heart Academy. It has good public and parish schools and a public library. The government is vested in a mayor, who holds office two years, and a council. Pop. (1890) 3,426; (1900) 4,366.

Missouri, admitted into the Union as a State 10 Aug. 1821; is bounded north by Iowa, south by Arkansas, east by Illinois, Kentucky and Tennessee, west by Nebraska, Kansas and Indian Territory. Capital, Jefferson City. Area, 69,415 square miles. Pop. (1900) 3,106,665.

Topography.—Missouri is divided into two portions, a northern and a southern, by the Missouri River, which flows in an easterly direction from its junction with the Kansas to a point 12 miles above Saint Louis, where it unites with the Mississippi. The surface of the northern portion is broken and hilly, but not mountainous. Well watered, the land is well adapted to agriculture; but in the eastern parts, and especially along the bluffs of the two great rivers, much timber land is found. The southern portion is about equally divided between timber land in the east and arable land in the west. In the southeast the Ozark Hills form a table-land, rising high above the level of the sea. The southeastern lowlands have an undulating surface, easily drained, with fertile ridges generally running north and south, forests of oak, hickory, elm, maple, ash, locust, willow, persimmon, pecan, chestnut, and cherry trees. In the lowest places are found swamps and morasses. From the mouth of the Meramec River, 25 miles below Saint Louis to Saint Genevieve, rise high, rocky bluffs, sometimes 150 feet above the water, and from Saint Genevieve to the Arkansas border extend low bottom lands with many small lakes and sloughs. The southeast corner of the State is 275 feet above the sea, the northeast, 445 feet, and the northwest corner 1,000 feet. There are no high mountains in Missouri, the Ozark range, the highest, having an elevation of only 1,600 feet.

River Systems.—The Mississippi flows along the eastern shore of the State, its greatest tributary being the Missouri. From the Ozark hills the Osage, the Gasconade, and other smaller streams flow to the north and east into the Missouri. The Meramec flows through a hilly, wooded country, in a northeasterly direction, and empties into the Mississippi near Saint Louis.

Climate.—Missouri lies far from the ocean and unprotected by mountain ranges. Its climate, therefore, is one of extremes in heat and cold, moisture and drought. The highest range of mountains in the State in the Ozark region, is lofty enough to influence somewhat the climate of the neighboring country, but not sufficiently so to affect that of the State at large. The mean summer temperature, as shown by observations extending over a period of 20 years, has ranged from 75° in the northwest of the State to 78.5° in the southeast, but the thermometer often indicates a temperature of more than 100°. The winter temperature during this period has averaged 33.87° for the State, varying from 28.5 in the northeast and 39.5 in the southeast. The winter climate is exceedingly variable. Sometimes the temperature falls below zero. In some winters the temperature scarcely reaches zero. In others a temperature of 20°

MISSOURI

and more below zero has been registered. Now and then the Mississippi at Saint Louis freezes over so that loaded wagons can cross for weeks at a time. This, however, is partly caused by the masses of floating ice coming down from above, which accumulate above the piers of the bridges. Sometimes the river remains open until the middle of February, and again is closed for the season early in December. The Missouri River is often entirely closed during the winter season. The mean annual temperature of the State varies from 53° to 58°. In spite of abundant rains, especially in the spring, the climate is, on the whole, a dry one, evaporation being so rapid that the atmosphere is seldom overloaded with moisture. The driest month is usually April. A clear sky, salubrious soil and climate, with an unusual amount of fair weather, are chief among the natural advantages of Missouri.

Farming and Stock Raising.—The staple products of Missouri are wheat, oats, Indian corn, and tobacco, but in the southern portions of the State cotton, hemp and flax are also raised to some extent. Thirty bushels of wheat to the acre is an average yield, which is often far exceeded. The flour from Missouri wheat is in great demand in the foreign as well as the home markets, and is regarded as of very high quality. All kinds of grass which favor the raising of stock grow luxuriantly, such as blue grass, timothy, red top, red and white clover. The raising of pork is a large industry, on account of the cheapness of corn. All kinds of fruit are successfully cultivated, not only the more hardy fruits such as the apple, pear, plum, and cherry, but those which require a softer climate, such as apricots, nectarines, figs, and many varieties of grapes. Apples and peaches grow well in all parts of the State. Very many varieties of grapes are found, especially in the southern part of the State, from which large quantities of wine are made. In the production of both red and white wines Missouri may be said to compete successfully with any of the vine-growing States of the Union. In the southern counties of Missouri sheep raising has been carried on with profit, the mild climate, the quality of the grass, and the abundance of good water being especially favorable here to this branch of agricultural industry. There are in Missouri in round numbers 23,000,000 acres of improved, and 10,000,000 acres of unimproved land, including 9,000,000 acres of woodland. The value of the farms including land and improvements (except buildings) is estimated at \$695,470,000; the value of buildings, \$148,508,400; of implements and machinery, \$28,602,680; and of live stock, \$160,540,000. In 1900 there were on the farms throughout the State 845,646 horses; 194,984 mules, asses and burros; 8,777 oxen; 1,070,584 cows; 663,702 sheep; 4,524,664 swine. Missouri ranks fifth among the corn producing States of the Union. In the culture of tobacco it may be put alongside of Kentucky, Virginia, Tennessee, and Maryland. Tobacco is a staple article in the northern central part of the State, in the rich counties bordering upon the Missouri River. No State in the Union raises so many mules and hogs. The annual production of cereals, according to recent statistics, was as follows: corn, 208,844 bushels; wheat, 23,072,768 bushels; rye, 220,388 bushels; oats, 20,545,350 bushels; buckwheat, 21,480

bushels; barley, 28,069 bushels; 4,326,896 tons of hay and forage were produced in 1899; 743,377 bushels of sweet potatoes and 629,143 bushels of Irish potatoes. The production of tobacco was 3,041,996 pounds. Fruit was raised as follows: apples, 8,698,170 bushels; peaches, 61,006 bushels; grapes, 13,783,656 pounds; cherries, 62,708 bushels.

Geology and Mining.—Missouri has large deposits of coal, iron, lead, zinc, and clays for the manufacture of the ordinary brick and for fire brick. The Missouri coal mines are easily worked, and include upper, middle and lower measures. In the upper measures are about four feet of coal, which is found within an area of about 8,400 square miles. In the middle coal measures there are about 7 feet of coal within an area of about 2,000 square miles. The coal in the lower measures is found in several seams bearing from 1½ feet to 4½ feet in thickness. In 1901 3,802,088 tons (of 2,000 pounds) of bituminous coal were mined in Missouri, the value at the mine being \$4,707,164. Great deposits of iron ore have been found in Iron Mountain in the southeastern part of the State, in Shepard Mountain and at Pilot Knob. The Scotia Iron Banks and Iron Ridge also furnish ores which in appearance and character are generally found in boulders imbedded in soft red hematite. While the chief deposits of iron ores are found in the above mentioned places, smaller deposits are found throughout the hilly regions of the southern part of the State, especially in the counties of Saint Genevieve, Madison, Saint François, Cape Girardeau, Bollinger, Wayne, Stoddard, Washington, Reynolds, Shannon, Carter, and Ripley. The supply of iron ores may be said to be practically inexhaustible. Lead is found in vast deposits in the southern part of the State. The great lead region through which lead ore is very generally disseminated, occupies about one half of the northern portion of Madison County and a somewhat larger territory in Saint François County. The lead is found in the magnesian limestone, and although the percentage of lead in the ore is small, when worked upon a large scale a good profit ensues. The great lead mines of Granby were in the early history of the lead industry in Missouri the best known in the State. Millions of pounds of lead have from time to time been taken from these lands. Of late years the neighborhood of Bonne Terre, in which are located the works of the Saint Joseph Lead Company, has been occupied by several corporations under whose direction vast quantities of lead are obtained every year. It is doubtful whether any other section in the country, or perhaps in the world, produces so much lead each year as is produced in these works. The total production of Missouri lead for the year 1902 amounted to nominally 300,000 tons as compared with 28,000 tons for the year 1901.

Zinc is found in the shape of sulphide, and also silicate of zinc, in nearly all the lead mines of southwestern Missouri. A quarter of a century ago it was found in such masses as to hinder mining operations, and on account of the lack of railroad facilities it was thrown aside as worthless until vast quantities of it had accumulated. Of late years, however, zinc has been an important and profitable adjunct of the lead mines of Missouri. Small quantities of cobalt and some nickel are found in the lead

MISSOURI

mines of the southeast. Building stone of all kinds, including marble, limestone, sandstone, and both red and gray granite, abound in Missouri, and constitute an important item in the mineral values of the State.

Manufactures.—Outside of the city of Saint Louis the leading manufacturing counties are Jackson, Buchanan, Saint Charles, Marion, Franklin, Greene, Cape Girardeau, Platte, Boone, and Lafayette. Saint Louis produces about three fourths of the manufactured products of the State. Among the chief manufacturing industries of Saint Louis, according to the census of 1900, are the following:

Boots and shoes, valued at.....	\$ 2,765,434
Carriage and wagon material.....	4,033,799
Railroad cars	4,974,662
Street cars	2,406,836
Clothing	5,577,442
Flouring and grist mill products.....	4,004,062
Malt liquors	11,673,599
Slaughtering and meat packing.....	12,267,532
Tobacco in various forms.....	26,067,670

Kansas City and Saint Joseph are important centres of manufacture, especially of meat products. The valuation of all the industries of Kansas City in 1900 was \$36,527,392, including:

Agricultural implements.....	\$ 438,089
Cars and general shop construction.....	578,040
Clothing (factory product).....	1,123,739
Confectionery	1,955,886
Flouring and grist mill products.....	2,079,111
Foundry and machine shop products.....	1,042,448
Printing and publishing (book and job).....	1,187,253
Tobacco in various forms.....	224,303

In 1900 the value of products in Saint Joseph was \$31,690,736, among which are:

Car and shop construction.....	\$ 639,521
Clothing (factory product).....	1,782,395
Flouring and grist mill products.....	956,576
Slaughtering and meat packing.....	19,009,332

In Springfield the total value of products was \$4,126,871; in Joplin, \$2,961,793, of which \$592,421 belonged to foundry and machine shop products.

Railroads.—Many important systems of railroads traverse the State, connecting at different points with the great trunk lines leading to all parts of the country. About 30 railroads have their entrance into the great Union Station at Saint Louis. Besides these main lines many cross lines and electric roads have been constructed and are in process of construction throughout the State. The leading trunk lines with eastern branches are the Wabash, the Pennsylvania, the Baltimore & Ohio Southwestern, and several lines running directly to Chicago, namely, the Illinois Central, the Chicago & Alton, Wabash, Rock Island, Chicago, Burlington & Quincy. The lines running to the west, northwest and southwest are the Missouri Pacific, which connects at various points with the great southwestern lines; the Wabash; the Chicago, Burlington & Quincy; the Rock Island; the Iron Mountain, which is included in the Missouri Pacific system; the San Francisco, included in the Rock Island system. These are the leading railroads, which connect at many points with all the great thoroughfares of the United States. River transportation for freight has been revived in late years, and large quantities of cereal products especially are taken to New Orleans from Saint Louis by river and there transferred to the ocean-going steamships. In 1902, 2,308,704 bushels of wheat and 226,400 bushels of corn went to foreign markets by river from Saint Louis via New Orleans.

Finances.—In 1900 the assessed valuation of the State was \$1,004,469,071. The bonded debt

1 Jan. 1901, was \$1,887,000. The State certificates of indebtedness amounted on 1 Jan. 1901, to \$3,158,000. The tax rate in 1895 was \$5.75 per \$1,000; in 1902, \$3 per 1,000. In 1902 the assessed valuation of all the taxable property in the city of Saint Louis was \$390,025,000, which was regarded as 66⅔ per cent of the actual value. The tax rate was \$1.95 per \$100. The net public debt was \$18,262,409. In Kansas City in 1902 the assessed valuation of all taxable property was \$82,120,443, which was 40 per cent of the actual value. The tax rate was \$1.55 per \$100, and the net public debt \$3,125,000.

Banks.—In 1900 there were 63 National banks in Missouri, with a capital stock of \$14,915,000, and deposits of about \$70,000,000. There are numerous incorporated State banks with a total capital of about \$20,000,000. There are also some private banks and in the large cities, trust companies, with a large amount of capital. In the year 1902 there were in Saint Louis 33 banks and trust companies, with a total capital and surplus of \$87,267,173. In the year 1872 there were 58 banks with a capital and surplus of \$20,196,098, showing that while during the 20 years the number of banks has decreased by 25, indicating a greater consolidation and strength of interest, the amount of capital and surplus has more than quadrupled.

Education.—Missouri has a public school system of education, adopted in 1839. There are district schools, elementary and ungraded; city schools, graded, with high school courses. There are four normal schools maintained by the State, and a State University. The State University is supported by what is called "The Permanent Endowment," consisting of certificates of indebtedness amounting to a total of \$1,235,839, and in the year 1902 the total appropriations made by the Legislature of the State for the entire University, including all departments, was \$586,400. The total amount of funds for the use of public schools is \$12,795,516. From the income of this amount there was paid in 1902 for teachers' wages the sum of \$3,078,667 in the city, town and village schools. In Saint Louis in 1902 the estimated value of school property was \$7,960,445; the total receipts from all sources for the use of the schools was \$2,447,016; and the total expenditures \$2,189,648, of which \$1,163,985 was paid for teachers' wages. Free public schools for white and colored children between the ages of 6 and 20 years are required by law for every district in the State. Besides these institutions supported by the State there are also many private institutions of all grades, for both sexes. Chief among these may be mentioned the Saint Louis University, founded in 1829, under the control of the Jesuit Order of the Roman Catholic Church, with buildings on the college premises representing a total value of about \$1,000,000; Washington University in Saint Louis, a non-sectarian institution, which has property estimated at about \$7,000,000; William Jewell College, at Liberty, Mo., in charge of the Baptist denomination; Drury College (Congregational) at Springfield, Mo.; Central College (Southern Methodist) at Fayette, Mo.; Westminster College (Presbyterian) at Fulton, Mo.; and others under the control of various religious bodies through the State. The value of buildings and grounds of private educational institutions

1111-1111

STATE CAPITAL AT INDIANAPOLIS

MISSOURI

was, in 1902, \$6,740,437, and the amount of permanent endowment was \$8,988,232.

Churches.—The first settlers of Missouri were Roman Catholics. In 1819 Christ Church (Protestant Episcopal) was founded in Saint Louis, and soon various religious bodies established themselves in all parts of the State. In the cities and towns along the great rivers the Roman Catholic Church is to-day very strong, and its members are numerous throughout the State. The Methodists (both Northern and Southern wings), the Baptists, the Presbyterians (several branches), and the Episcopalians are the leading Protestant bodies as to numbers, in the order named. Each of these organizations except the Episcopalians has a college supported mainly by its members, and the Roman Catholics have, chiefly in the cities, their parochial schools.

Charitable and Penal Institutions.—The State penitentiary is located at Jefferson City. The number of prisoners is about 2,000. In the last official report the number of white males was given as 1,267; white females, 48; persons of foreign birth, 116; natives, 1,935. The State appropriated in 1900, \$80,000 for the support of the penitentiary. The profits from labor exceeded this amount by \$50,000. At Booneville is a Reform School for boys with 339 inmates. This school is maintained by the counties from which the boys are sent and costs about \$23,000 a year. At Chillicothe is the Girls' Industrial School, upon which is expended annually \$14,000. A refuge for the feeble-minded has been established at Marshall, and at Fulton, Saint Joseph, Nevada and Farmington are State asylums for the insane. The State also aids to some extent the insane asylum at Saint Louis, mainly supported by the city. At Higginsville is the Confederate Home, supported at an annual cost of \$46,000, and at Saint James the Federal Soldiers' Home, which costs \$20,000 a year.

Government.—The present constitution of Missouri was adopted by popular vote in 1875, after a convention called for that purpose had framed it and recommended it for adoption. The Legislature, consisting of a Senate and a House of Representatives, meets biennially on the Wednesday after the first day of January following the election of members. The pay of members is not to exceed \$5 a day for 70 days, and if the session is further prolonged, an allowance of only \$1 a day is made for the remainder of the session. Mileage is also allowed to members. In the executive department are a Governor, a Lieutenant Governor, a Secretary of State, a State Auditor, State Treasurer, Attorney General, and a Superintendent of Public Instruction. The Governor, in whom is vested the supreme executive power, is chosen for 4 years, as also are other members of the executive department. The Governor has a qualified veto upon the acts of the Legislature. The State judicial authority is vested in a Supreme Court, the Saint Louis Court of Appeals, the Kansas City Court of Appeals, the State Circuit Courts, Criminal Courts, Probate Courts, and Municipal Courts. The judges and officers of the courts are elected by the people. Judges of the Supreme Court are elected for 10 years; of the Saint Louis and Kansas City Courts of Appeals for 12 years; of the Circuit Courts for 6 years. The House of Representatives has the right of impeachment of executive and judicial officers. The Senate tries all cases

of impeachment. Every male citizen of the United States and every male person of foreign birth who may have declared his intention to become a citizen of the United States according to law, not less than one year nor more than five years before he offers to vote, who is over the age of 21 years, is entitled to vote at all elections by the people if he has resided in the State one year immediately preceding the election at which he offers to vote, and has resided in the county, city or town where he shall offer to vote at least 60 days immediately preceding the election.

Politics.—Missouri has for more than 30 years been a Democratic State. The vote of the State for presidential electors in 1880 was as follows: Democratic, 208,609; Republican, 155,567; other parties about 80,000. In 1892 the Democratic vote was 268,398; Republican, 226,918; other parties about 85,000. In 1900 the Democratic vote was 351,922; the Republican, 314,092; other parties about 45,000.

Population.—Missouri is divided into 114 counties. The following table gives the number of inhabitants since 1850:

YEAR	Males	Females	Total	Density per sq. mile
1850.....	357,832	324,212	682,044	14.37
1860.....	622,201	559,811	1,182,012	18.08
1870.....	896,347	824,948	1,721,295	26.34
1880.....	1,127,187	1,041,193	2,168,380	31.55
1890.....	1,385,238	1,293,946	2,679,184	39.
1900.....	1,595,710	1,510,955	3,106,665	45.2

In 1900 the foreign born residents numbered 216,370. There were also 161,234 persons of negro descent. The early settlers of the State were foreign and the population remained French for 50 years after the first settlement. The descendants of those early French families are still to be found in Saint Louis and in many of the older towns. Many Germans have settled in Missouri, especially in Saint Louis, Saint Charles, Saint Joseph, Kansas City, as well as in many of the smaller towns, and a considerable part of the population is made up of English, Irish, Scotch, and Swedes. The native American population until a generation ago was mostly descended from immigrants from the States of Kentucky, Tennessee, North Carolina, and Virginia, but during the last 40 years a large accession to the population has come from the eastern and northwestern States. Saint Louis, the largest city in the State and the most important in the Mississippi Valley, situated upon the Mississippi River, about 12 miles below its junction with the Missouri, had a population in 1900 of 575,238. Kansas City, the next largest town in Missouri, on the western border of the State, had in 1900, 163,752. Saint Joseph, in the northwestern part of the State, 102,079; Hannibal, a river town in the eastern part of the State, 23,267; Sedalia, in the central part of the State, 15,231; Jefferson City, the capital, 9,664.

History.—Missouri is a part of the territory of which La Salle, the French voyager and discoverer, took possession on 9 April 1682, which he named Louisiana in honor of the king of France, Louis XIV. The first settlements in Missouri were made at Saint Genevieve and

MISSOURI

New Bourbon, the exact dates of which are unknown. Some say in 1763; others, supported by traditions, as early as 1735. Saint Louis was settled by Pierre Laclède Liguist, a Frenchman. The place for the settlement was selected in 1763 and in February 1764, August Chouteau, at the order of Liguist, began the erection of a village. Settlements of the future State of Missouri were for many years confined to the banks of the rivers. In 1803 all that tract of land called Louisiana was purchased from the French by the United States government, and under an act of Congress passed 31 Oct. 1803, the transfer of Lower Louisiana was made on 18 December 1803. The next year the territory was divided by Congress into two portions; the northern part, commonly called Upper Louisiana, was taken possession of in March 1804. Missouri was organized as a territory in June 1812. The first Governor was William Clark, who served from 1813 to 1820. The application of Missouri for admission to the Union as a State in 1818 was followed by two years of earnest controversy, which excited the whole country and endangered the very existence of the Union. The controversy had as its foundation an attempt to prevent the admission of Missouri to the Union except as an anti-slavery State. This controversy was finally settled by the admission of Missouri upon what was called the "Missouri Compromise" (q.v.), which forbade the existence of slavery in that part of the Louisiana Purchase north of 36° 30', except in Missouri; and Missouri was admitted to the Union on 21 Aug. 1821. The constitution adopted upon admission remained practically unchanged until 1865. The first Governor under the State constitution was Alexander McNair. Saint Charles was first fixed upon as the seat of government in 1820, but in 1826 the capital was removed to Jefferson City, where it still remains. The first official census of the State, which was taken in 1821, showed that there were in all 70,647 inhabitants, of whom 11,254 were slaves. Missouri troops had their share in the various Indian wars, such as the Black Hawk war in 1832; the Florida war in 1837; and afterward in the Mexican war in 1846. Being a border State and a slave State as well, in all the troubles preceding the outbreak of the War of the Rebellion Missouri was deeply concerned. In many parts of the State the sentiment was strongly in favor of secession. Governor Jackson in January 1861, declared that Missouri must take its stand by the side of slave-holding States whatever they might decide to do. A convention was called to consider the affairs of the nation and in that convention it was made clear that the public sentiment was hostile to secession, and the convention succeeded in preventing any committal of the State to secession. United States troops were gathered at Saint Louis. Attempts made to take possession of the United States arsenal at Saint Louis, with its equipment, by the Secessionists were defeated, and within a few months after the outbreak of the War the greater part of the State was under the control of the United States forces. Governor Jackson declared the State out of the Union, and Confederate forces were assembled in the southwestern part of the State, but the State Convention which had met before now convened again and declared the executive offices vacant and the seats of members of the Legis-

lature also vacant, and the executive offices were then filled by appointment by the convention. At the battle of Wilson's Creek, near Springfield, General Lyon, who had been a strong Union leader, was killed, and General Frémont, who had been placed in charge of the Department of the West, declared martial law throughout the State. At the beginning of the year 1862 the Confederates held nearly half the State, but their strength waned soon afterward and after the beginning of the year 1864 no further trouble arose in Missouri.

The State furnished to the United States during the Civil War 108,773 troops. In 1865 a new constitution was adopted by the people, and in 1869, by a large majority, the 15th amendment to the United States Constitution was adopted. In 1875 a convention was called to draw up a new State constitution. This constitution of 1875 was ratified by the people, and has since then been the fundamental law of the State, modified in some minor particulars by amendments adopted from time to time.

MARSHALL S. SNOW,
Professor of History, Washington University.

Missouri, a river in the United States, the largest tributary of the Mississippi. Its headwaters are in southwestern Montana, and the Missouri River proper begins at the confluence of the Jefferson, Madison, and Gallatin rivers. The Madison has its source in Yellowstone Park, near the head-waters of Yellowstone River and the geysers in the western part of the park. The Gallatin also has its rise in the same park and not far from the source of the Yellowstone and Madison rivers. The Jefferson rises farther west, its head-waters are near the source of the Snake River. The Missouri from the confluence of the three rivers flows north and east to the Bear Paw Mountains, when it turns and flows south and east a distance of about 50 miles, when again the course changes toward the east, from the 108th meridian to about 107° 30' northeast, then east to North Dakota, which State it enters at 48° N. It has a very irregular course in the northwestern part of North Dakota, but it is generally southeast to South Dakota, which State it enters at 100° 20' W. It crosses the State of South Dakota, marking an irregular course, generally in a southeasterly direction to the boundary of Nebraska at 42° 45' N. From here it forms the boundary between South Dakota and Nebraska to Iowa at 42° 20', when it turns south and forms the boundary between Nebraska and Iowa, Nebraska and Missouri, and Kansas and Missouri to Kansas City, where it enters the State of Missouri, flows east by north to Brunswick, then east by south, making two large curves, to the Mississippi which river it enters 20 miles north of Saint Louis. The length of the whole course from the source of the Madison River is about 2,915 miles, from the source of the Jefferson about 3,000 miles. From its source to the mouth of the Mississippi River is a total length of 4,200 miles, the longest continuous water-way in the world. There are some peculiar irregularities along its course, one in Montana, where the Musselshell River enters, is in the form of a "V," its opening toward the north, the point where the Musselshell enters, and the sides about 12 miles long. Along the course in each State there are long narrow loops, enclosing lands which

MISSOURI

are almost islands; across the State of Missouri the river forms three crescents, one pointing north and two pointing south.

The Missouri is noted for the great amount of suspended silt it always carries and which has given it the name "Big Muddy." This silt is deposited in reefs which change the current, and frequently much damage results. In 1903 considerable damages were sustained by the washing away or grinding away of portions of Decatur, and Covington in Nebraska, Sioux City in Iowa, and Yankton in South Dakota. The river follows no known rules as to when or where it will deposit its burden of silt, change its current, and begin to destroy a solid shore line. Dikes and stone walls have been constructed in many places. In the upper part of its course the Missouri passes through the "Gate of the Rocky Mountains," a gorge about six miles long and having perpendicular walls about 1,200 feet in height. At Great Falls, Mont., there are a series of falls making a vertical descent of 350 feet in 16 miles. The highest falls is 87 feet.

The chief tributaries are: in Missouri, the Osage and Kansas; in Nebraska, the Platte and Niobrara; a large number of short streams in Iowa; the Big Sioux, White, James, and Cheyenne, in South Dakota; the Little Missouri in North Dakota; and the Yellowstone and Milk in Montana. The extent of country drained by the Missouri and its tributaries is about 500,000 square miles or nearly two fifths of the whole Mississippi basin. The northern point of the basin of the Missouri extends almost to the Saskatchewan River. The Missouri is a swiftly flowing stream in its upper course, and for a distance of about 500 miles it presents scenes of almost unequal grandeur. It forces its way through narrow gorges, foams over cataracts, and winds around mountains. In the lower part of its course the waters move more slowly on its journeys across the vast plains. It is navigable in summer, during the flood period, to Great Falls, Mont., and in low water as far as Buford at the mouth of the Yellowstone River. The flat-bottomed steamboats are necessarily those used for navigation on the Missouri.

The principal cities on the river from the upper course to its mouth, are Great Falls and Fort Benton in Montana; Bismarck, the capital of North Dakota; Pierre the capital of South Dakota; Sioux City, Ia.; Omaha, Neb.; Atchison, Leavenworth, and Kansas City, Kan.; Kansas City and Jefferson City, Mo. That portion of Iowa lying near the mouth of the Little Sioux and north for about 70 miles, between the Missouri and the Little Sioux, is below the level of the Missouri from 8 to 32 feet. The area of the tract below water level is about 840 square miles, and embraces some of the finest farms and most prosperous towns of the State. It is proposed (1903) to straighten the Little Sioux and to improve the channels and outlets so as to prevent inundations, and also to improve the drainage of this fertile and populous region.

The history of this river is connected with the history of the early explorers and missionaries and with the lives of the miners and settlers of the latter part of the 19th century. The possibilities in the unused water-power of its upper course are enormous. The great prairies through which the river passes on its

lower course contain the most productive lands in the United States.

Missouri, or Gourd-seed, Sucker, a fish.
See BLACKHORSE.

Missouri Compromise, in American politics, a term given to a compromise under an act of Congress passed in February 1821, at which time Missouri was admitted into the Union as a slave State, declaring that all territory west of Missouri and north of lat. 36° 30' should forever be free from slavery. This compromise was virtually repealed in 1854, when territorial governments were established for Kansas and Nebraska. See KANSAS, *History*; KANSAS-NEBRASKA BILL; MISSOURI.

Missouri, University of, the State university located at Columbia, Boone County. It was chartered by the legislature in 1839, the cornerstone of the main building was laid in July 1840, and instruction in academic work was begun in 1841. The organization comprises eight departments: (1) Graduate Department established 1866; (2) Academic Department; (3) Department of Education (1868); (4) Law (1872); (5) Medicine (1873); (6) Military Science and Tactics (1890); (7) College of Agriculture and Mechanic Arts (1870); (8) School of Mines and Metallurgy (1870), situated at Rolla. The College of Agriculture includes the School of Agriculture, the School of Engineering and the State Experiment Station. The School of Engineering offers courses in civil, electrical, mechanical, sanitary, chemical and hydraulic engineering; the course in the School of Mines includes mining and civil engineering. The degrees conferred are bachelor of arts, bachelor of laws, bachelor of science (in the College of Agriculture and the Mechanic Arts, and the School of Mines and Metallurgy), and doctor of medicine; also the graduate degrees, master of arts, doctor of philosophy, master of science, master of laws, civil engineer, electrical engineer, mechanical engineer, sanitary engineer, engineer of mines, and civil engineer. In 1869 women were admitted to the Normal Department (Department of Education), in 1870 to the Academic Department, and soon afterward to all existing departments; they are now admitted on equal terms to all departments except the Department of Military Science and Tactics. A dormitory for women has been erected on the horticultural grounds which adjoin the regular campus. The University Library includes the general library, 10 departmental libraries and the library of the School of Mines. There being no special library building (1903), the general library, the classical library, the political science library and the romance library are in Academic Hall; other departmental libraries are in the buildings of their respective departments, the library of the School of Mines being at Rolla; these libraries contained in all about 55,000 volumes in 1903. There are rooms in Academic Hall set apart for gymnasium work for men and women, and there is also an athletic field; competitive athletics and inter-collegiate contests are encouraged, and though regarded as essentially a student enterprise, are under supervision by the faculty. In 1868, the State for the first time gave aid to the University, and has since made several appropriations for special

MISSOURI VALLEY — MITCHEL

purposes; the endowment is about \$2,500,000; and the annual income in 1903 was \$422,000. The students numbered 1,681 in 1903 and the faculty, 100.

Missouri Valley, Iowa, city in Harrison County; on the Sioux City & P., the Chicago & N., and the Fremont, E. & M. V. R.R.'s; about 120 miles west of Des Moines, the capital of the State, and 20 miles north of Council Bluffs. The industrial establishments are large railroad shops, machine-shops, flour mills, dairy products, bricks, coffins, grain elevators, and stock yards. The fair grounds of the County Agricultural Society are located here. It has a public library of about 2,000 volumes. The city owns and operates the waterworks. Pop. (1890) 2,797; (1900) 4,010.

Missouri Valley College, in Marshal, Mo., a coeducational institution, founded under the auspices of the Cumberland Presbyterians in 1889. The courses lead to the degrees of A.B. and Ph.B. In 1902 there were 14 instructors and professors, 250 students. There were about 7,200 volumes in the library, and the grounds, buildings, and apparatus were valued at \$125,000; the productive funds at \$113,000, and the annual income about \$19,000. The number of graduates were about 350.

Mist. See Fog.

Mistake, a term commonly used as the equivalent of blunder, error, erratum, and particularly employed in law of a misconception affecting action. In general the law, by an extension of the rule that ignorance is no excuse, makes a mistake without remedy. This is not true, however, in any misapprehension which may be brought under the law of contracts or the principle of quasi-contract. So, too, in equity there is a possibility of relief for mistake and its consequences.

Mistassini, mîs-tās-sē'nē, Canada, a lake of the Ungava district, about 300 miles north of Quebec, and due east from the southern point of James Bay in Hudson Bay. It consists of two parallel narrow portions separated by a chain of islands, the western and larger portion being about 100 miles long, and 10 or 12 broad. It has a depth of between 300 and 400 feet. It drains by Rupert's River into James Bay. The waters of Mistassini teem with fish, while its shores are densely wooded. The lake was first visited by French missionaries in 1671, but was not surveyed until 1884. The Hudson's Bay Company maintains a trading-post on the lake.

Mistec. See MIXTEC.

Mistle-thrush, or **Stormcock**, British names for a large European thrush (*Turdus viscivorus*), whose fine song is heard for a longer season than in the case of most birds, and on rainy days as well as sunny. Its common name is due to its unusual fondness for the berries of the mistletoe. In plumage it resembles the American wood-thrush.

Mistletoe, a popular name for several related shrubs parasitic upon various deciduous trees such as apple, thorn, maple, poplar, locust, linden, and occasionally oak. The European or common mistletoe (*Viscum album*) of the natural order *Loranthaceae*, is the one referred to in poetry and prose but a relative, named *Phoradendron flavescens*, is the species most commonly found at Christmas time in the markets of America. The former which is com-

mon almost throughout Europe, is an evergreen, bifurcately branched shrub, with opposite, almost sessile, oblong, leathery leaves; inconspicuous flowers in small terminal heads or in the angles of the branches, the pistillate and staminate flowers upon separate plants; and whitish, translucent, glutinous berries about a quarter of an inch in diameter. The stickiness serves to attach the berries to the host plant until germination is complete, the sprout, it is said, always turning toward the point of attachment. The American or false mistletoe is similar in habit and appearance, and has fallen heir to some of the traditions and functions of its European cousin, especially the Christmas practice of kissing under a suspended sprig. Anciently the European species was held to be sacred by the Druids and the Germans, and by the Celts was credited with magical properties, references to all of which are frequent in literature. Its formerly reputed value in medicine has also passed away. Several other species are well known, especially the fragrant flowered *Loranthus odoratus*, and *L. europæus*; the latter being distinguished for its racemes of flowers and its frequent appearance upon oak trees. The common American species mentioned above ranges from New Jersey to Indiana and southward to Florida and Texas. Several related species are found on the Pacific coast.

Mistral, Frédéric, frā-dā-rĕk mēs-trāl (or **Frederi**), French poet: b. Maillane, Bouches-du-Rhône, 8 Sept. 1830. He studied law for a time at Aix, but soon abandoned it, and gave his attention to writing in Provençal, the dialect of southern France, which, under the influence of Jasmin, the "barber-poet," had entered on a renaissance as a literary medium. In 1854 he, with six others, founded the well-known Society of the Félibrige; and in 1859 he published his 'Mirëio,' a narrative poem in the recovered language, which was crowned by the Académie in 1861. A second work in verse, 'Calendau,' came out in 1867; a volume of poems, 'Lis Isclo d'Or' (The Isles of Gold), in 1875; 'Lou Trésor dou Félibrige,' a dictionary of modern Provençal, in 1878-86; and the historical poem 'Nerto,' in 1884. 'La Rèino Jano' (1890) is a tragedy, and 'Le Poème du Rhône' (1879), another narrative poem. There are English renderings of 'Mirëio' by Grant (1867), Crichton (1868), and Preston (1872). Consult: Gaston Paris, 'Penseurs et Poètes' (1896); Welter, 'Frédéric Mistral, der Dichter der Provence' (1899); Downer, 'Frédéric Mistral' (1901).

Mist'ral, the local or provincial name of a strong northwest wind, which, blowing from the Alps, forms one of the scourges of Provence and the valley of the Rhône. It blows with great violence during the winter and spring months. Its approach is indicated by a sudden change in the temperature from warmth to cold; the air becomes purer and more invigorating, light fleecy clouds are seen in the sky, and at night the stars shine with extraordinary brightness.

Mitchel, mîch'el, John, Irish patriot: b. Dungiven, County Derry, 3 Nov. 1815; d. Cork 20 March 1875. He was graduated from Trinity College, Dublin, in 1836, and practised several years as an attorney at Banbridge. Soon after the starting of the 'Nation' in 1842, Mitchell began to contribute to that journal and after the death of Thomas Davis, in 1845, became

MITCHEL — MITCHELL

assistant editor. In 1848 he began the publication of the 'United Irishman,' for his articles in which he was sentenced to 14 years' transportation for felony. He was sent to Bermuda, and next to Tasmania, whence he made his escape to the United States in the summer of 1853. Here he published a series of short-lived newspapers, the 'Citizen' (at New York), the 'Southern Citizen' (Knoxville, Tenn.), the 'Inquirer' (Richmond, Va.), and the 'Irish Citizen' (New York.) His advocacy of slavery did much to lessen American interest in him, and in 1874 he returned to Ireland. He was elected to Parliament from Tipperary, was declared ineligible, but was re-elected. Among his writings are: 'Life of Hugh O'Neill' (1845); 'Jail Journal; or Five Years in British Prisons' (1854); and a 'History of Ireland from the Treaty of Limerick' (1868).

Mitchel, Ormsby McKnight, American astronomer: b. Morgansfield, Ky., 10 July 1810; d. Hilton Head, S. C., 30 Oct. 1862. He was graduated from West Point in 1829, and was made assistant professor of mathematics there, which post he held for two years. From 1832 to 1834 he was counsellor at law in Cincinnati, Ohio; from 1834 to 1844 professor of mathematics, philosophy, and astronomy at Cincinnati College; and 1836-7 chief engineer of the Little Miami railroad. He lectured in various parts of the United States on astronomy in 1842-8, raised funds for the building of an observatory at Cincinnati, the cornerstone of which was laid 9 Nov. 1843, and was its director in 1845-59. In 1859 he became director of the Dudley Observatory at Albany, N. Y. He was known as a popular lecturer on astronomy, and scarcely less distinguished for his mechanical skill. He perfected a variety of apparatus of great use to astronomy. One of the most important of his constructions was an apparatus for recording right ascensions and declinations to within $\frac{1}{1000}$ of a second. He also invented an instrument for the measurement with great accuracy of large differences of declination, such as the ordinary method by micrometer was unable to reach. In 1861 he entered the Federal army as brigadier-general of Ohio volunteers, and on 11 April 1862 was promoted major-general. From 17 Sept. he commanded the department of the South and the Tenth corps, operating in South Carolina. He was known in the army as "Old Stars." He was a fellow of the American Academy of Arts and Sciences and an associate of the Royal Astronomical Society of London. He published and edited 'The Sidereal Messenger' (1848-58), and wrote: 'The Planetary and Stellar Worlds' (1848); 'The Orbs of Heaven' (1851); 'A Concise Elementary Treatise of the Sun, Planets, Satellites, and Comets' (1860); and 'The Astronomy of the Bible' (1863).

Mitchell, mich'el, Clifford, American physician: b. Nantucket, Mass., 28 Jan. 1854. He was graduated at Harvard in 1875; studied medicine in Chicago in the Medical College and the Homœopathic Medical College; began to practise in Chicago in 1878; and devoted himself to diseases of the kidneys. In 1902 he established the Chicago Laboratory for Clinical Diagnosis. He is professor of chemistry, toxicology and renal diseases in the Chicago Homœopathic College and author of 'Student's Manual of Urinary Analysis' (1879), 'Physician's Chemis-

try' (1884), 'Dentist's Manual of Special Chemistry' (1887), 'Renal Therapeutics' (1898), and 'Diseases of the Urinary Organs' (1903), etc.

Mitchell, Donald Grant, American author, whose pseudonym is "IK MARVEL": b. Norwich, Conn., 12 April 1822. He was graduated at Yale in 1841; traveled in Europe; studied law in New York; was United States consul to Venice in 1853; and in 1855 settled on his farm, "Edgewood," near New Haven. He has written much, on various themes, and always with a genial charm and ease of style. His best known works are the idyllic sketches called 'Reveries of a Bachelor' (1850), and 'Dream Life' (1851). He also wrote 'French Gleanings' (1847), descriptive of his first European trip, as 'The Battle Summer' (1850) was of his stay in Paris in 1848; 'The Lorgnette' (1850), a satiric novel of New York life in the forties; 'Fudge Doings' (1855), another New York society novel; 'Dr. Johns' (1866), a religious story contrasting life in Connecticut and in the French Midi; and the more characteristic papers on men, books, and out-doors, such as 'My Farm at Edgewood' (1863), 'Wet Days at Edgewood' (1865), 'Rural Studies' (1867), 'English Lands, Letters, and Kings' (1889), and 'American Lands and Letters' (1897).

Mitchell, Elisha, American scientist: b. Washington, Conn., 19 Aug. 1793; d. on Mount Mitchell, N. C., 27 June 1857. He was graduated at Yale in 1813; four years later became professor of mathematics in the University of North Carolina; and in 1826 was made professor of chemistry, mineralogy and geology in the same institution. The Olmsted-Mitchell Geological Survey (1824-8) did important work under his supervision. He discovered that a peak in North Carolina is the highest in the eastern States and was killed by a fall from this height, which is now called in his honor Mount Mitchell or Mitchell's Ligh Peak, and on whose summit he is buried.

Mitchell, Henry, American civil engineer: b. Nantucket, Mass., 16 Sept. 1830; d. Boston, Mass., 11 Dec. 1902. He was a son of William Mitchell (q.v.), was educated at the Normal School in Bridgewater, Mass., and in 1851 was appointed to government service as a civil engineer under the United States coast survey. He acted as assistant to the commissioners on harbor encroachments in New York in 1859 and discovered the underflow of the Hudson. He was later engaged in Boston harbor and assisted in the improvement of the mouth of the Mississippi in 1874. He made an investigation of the Panama canal scheme under De Lesseps and held many government commissions to investigate various harbors. He was appointed professor of physical hydrology at the Massachusetts Institute of Technology in 1869, and in 1873 was offered the same post in the Agassiz School of Science but resigned. He published many reports of surveys, etc.

Mitchell, Hinckley Gilbert, American Biblical scholar: b. Lee, Oneida County, N. Y., 22 Feb. 1846. He studied at Wesleyan University, where he was graduated in 1873, at the theological department of Boston University, and at the University of Leipsic. He was instructor at Wesleyan 1880-3, and since 1884 has been professor of Hebrew in Boston University.

MITCHELL

His most important publications are 'Hebrew Lessons' (1884), 'Amos' (1893), 'The Pentateuch' (1893), 'The Theology of the Old Testament' (a translation from the French of Piepenberg, 1893), and 'Isaiah, Chapters i.-xii.' (1900).

Mitchell, John, American labor leader: b. Braidwood, Will County, Ill., 4 Feb. 1870. He entered the mines at Braidwood at the age of 13, and in 1885 joined the Knights of Labor. The next few years he spent coal mining in different States of the West and Southwest, and in 1890 settled at Spring Valley, continuing his work at his trade. He read and studied constantly, and was a member of several debating societies and reform clubs; he was also active in the labor movement, and was president of the Knights of Labor local at Spring Valley. On the formation of the United Mine Workers in 1890 he became a member of that organization, was frequently delegate to district conventions and in 1895 was elected secretary-treasurer of the northern Illinois sub-district; in 1896 he was chairman of the Illinois mine workers' legislative committee, and in 1897 was made a national organizer of the United Mine Workers. In January 1898 he was elected vice-president of that organization, and in September of the same year became acting president; he was elected president in 1899, and has since been annually re-elected; he has also been a vice-president of the American Federation of Labor since 1898. Since he became president of the United Mine Workers the union has been enlarged, wages have been increased, and the eight hour day extended; he conducted the strikes of the anthracite miners in 1900 and 1902, and brought the latter to a close by his offer in behalf of the miners to accept the decisions of a commission appointed by the President of the United States. He is also a member of the Industrial Department of the National Civic Federation.

Mitchell, John Ames, American editor and author: b. New York 17 Jan. 1845. He was educated at Harvard and studied in Boston and Paris and was an architect in Boston in 1870-6, after which he became interested in decorative art and studied art in Paris 1876-80. Returning to New York he engaged in journalism as artist, illustrator and writer and in 1883 founded and has since edited 'Life.' He has published: 'Croquis de l'Exposition' (1879); 'The Romance of the Moon' (1886); 'The Last American' (1889); 'Amos Judd' (1895); 'The Pines of Lory' (1901); etc.

Mitchell, John H., American lawyer: b. Washington County, Pa., 22 June 1835. He was educated at Witherspoon Institute, Pa., and was admitted to the bar of Pennsylvania and went to California, where he established a law practice, but in 1860 removed to Oregon and engaged in practice there. He was State senator in 1862-6 and president of the senate in 1864. In 1873-9 and 1885-97 he was United States senator from Oregon and was returned to the Senate in 1901. He is counsel for numerous corporations and was professor at Willamette University, Salem, Ore., in 1867-71.

Mitchell, Maggie. See MITCHELL, MARGARET JULIA.

Mitchell, Margaret Julia ("MAGGIE MITCHELL"), American actress: b. New York 1832.

She made her first appearance on the stage as an infant and before she was five had taken child parts. She made her debut as Julia in 'The Soldier's Daughter' at Burton's Chambers Street Theatre in New York, and as Fanchon, the Cricket, produced in 1860, she made herself famous. She was married to Henry Paddock, her manager, 15 Oct. 1868, and continued her career on the stage, playing in many famous roles: 'The Pearl of Savoy'; 'Nan the Good for Nothing'; 'Jane Eyre'; etc., until her retirement.

Mitchell, Maria, American astronomer: b. Nantucket, Mass., 1 Aug. 1818; d. Lynn, Mass., 28 June 1889. She was the daughter of William Mitchell (q.v.), an astronomer of some note, and when a girl frequently assisted him in his observations. She taught for a time in a private school, and was for 20 years librarian of the Nantucket Athenæum, but continued to carry on her astronomical studies and observations. She first became known as an astronomer by her discovery of a comet in 1847, and for this discovery she received a medal from the king of Denmark. She later discovered several nebulae, and was engaged in computations for the 'Nautical Almanac,' and on work for the Coast Survey for several years. In 1848 she was elected an honorary member of the American Academy of Arts and Sciences, the first woman to receive this honor, and in 1857 went to Europe, visited the principal observatories, and was received with honor by Herschel, Humboldt, and other noted scientists. In 1865 she was appointed professor of astronomy and director of the observatory at Vassar College. She went to Burlington, Iowa, with some of her students, to observe the total eclipse of the sun in 1866, and on other eclipse expeditions; but for the most part she gave up her research and observation work to devote herself to teaching and building up her department. She was an inspiring and original teacher, and deeply interested in the advancement of the interests of the college; during her later years there she endeavored to raise a fund to endow the chair of astronomy; this fund (\$50,000) was completed after her death and was named in her honor the Maria Mitchell Endowment Fund. She resigned from her position at Vassar in 1888, and was made professor emeritus. She was a member of the American Association for the Advancement of Science, and was given the degree of LL.D. by Hanover in 1852 and by Columbia in 1887. She was a believer in woman's suffrage, but not active in the suffragist movement; she was, however, a member, and for several years president, of the American Association for the Advancement of Women.

Mitchell, Peter, Canadian politician: b. Newcastle, New Brunswick, 4 Jan. 1824; d. Montreal 25 Oct. 1890. He studied law and was admitted to the bar in 1848. Shipbuilding and other business pursuits soon engrossed his attention and he abandoned law, but in 1856 entered political life as member of the Canadian Parliament and five years later was appointed a life member of the Legislative Council. Mitchell was one of the foremost in the organization of the Canadian confederation, working for it both in and out of parliament. He was senator in 1867-72 and under the new government became minister of marine and fisheries and was

chiefly instrumental in settling the negotiations between United States and Canada over the Bering Sea fisheries. He returned to the parliament in 1874 and remained there until 1896, when he was defeated. He owned the *Montreal Herald*, was president of the Mitchell Steamship Company, and was closely connected with the Canadian Pacific Railway. In 1897 he received an appointment as inspector of the fisheries of the Atlantic provinces. He wrote a review of President Grant's message concerning the fisheries in 1870 and 'Notes of a Holiday Trip' (1880).

Mitchell, Samuel Augustus, American geographer: b. Bristol, Conn., 30 March 1792; d. Philadelphia 20 Dec. 1868. His early life was devoted to teaching in which he was very successful, but the inadequate treatment of geography by the text-books then in use induced him to turn his attention to the making of satisfactory ones and he spent 40 years in Philadelphia in the preparation of his text-books on that subject. So general was their adoption that they reached a sale of 400,000 annually. Besides his geographical text-books, of which there were 24, he edited a new edition of John James Audubon's 'Birds of America' and wrote: 'General View of the World, Physical, Political, and Statistical' (1846), and 'New Traveller's Guide through the United States' (1850).

Mitchell, Silas Weir, American physician, poet, and novelist: b. Philadelphia 15 Feb. 1829. He studied at the University of Pennsylvania, was graduated from Jefferson Medical College in 1850, entered practice in Philadelphia, during the Civil War was in charge of the Turner's Lane United States hospital (Philadelphia) for diseases and injuries of the nervous system, and subsequently was president of the Philadelphia College of Physicians. In his professional capacity he became known for his researches in connection with nervous diseases, and in physiology and toxicology. A bibliography of his publications would supply the titles of some 150 medical papers, recounting investigations of high scientific importance. To a wider degree, however, he is known through his literary work, composed principally of poetry and fiction. He was elected to the American Academy of Arts and Sciences and the National Academy of Sciences, and was also made associate, corresponding, or honorary member of foreign scientific societies. His works in medical science include: 'Researches on the Venom of the Rattlesnake' (1860); 'Gunshot Wounds and other Injuries of Nerves'; 'Reflex Paralysis' (1864); 'On Injuries of the Nerves and their Consequences' (1872); and 'Fat and Blood, and How to Make Them' (1877). Among his other writings are, in verse, 'The Hill of Stones' (1882); 'A Masque' (1887); 'The Psalm of Death' (1890), and 'The Wager' (1900); in fiction, 'Roland Blake' (1884); 'Far in the Forest' (1888); 'A Madeira Party' (1895); 'Hugh Wynne' (1897); 'The Adventures of François' (1899); 'The Autobiography of a Quack' (1900); 'Circumstance' (1901). 'Collected Poems' appeared in 1896. He wrote also a 'Memoir of Owen Jones' (1896).

Mitchell, Walter, American Protestant Episcopal clergyman: b. Nantucket, Mass., 22 Jan. 1826. He was graduated from Harvard in

1846 and admitted to the bar in 1849, but deciding to enter the Episcopal ministry, received ordination to the priesthood in 1860. He held many important charges and was for a time chaplain of Kenyon College, Gambier, Ohio, and has now retired from active service. He has published: 'Two Strings to His Bow'; 'Bryan Maurice'; etc.

Mitchell, William, American astronomer: b. Nantucket, Mass., 20 Dec. 1791; d. Poughkeepsie, N. Y., 19 April 1868. He taught for a time, became cashier of the Pacific bank in Nantucket, and made a long series of investigations in connection with the United States coast survey studies of the figure of the earth. Besides lecturing on astronomy in Boston and elsewhere, he contributed to the 'American Journal of Science,' and supplied time to whaling vessels. He was elected to the American Academy of Arts and Sciences.

Mitchell, S. Dak., city, county-seat of Davidson County; on two divisions of the Chicago, M. & St. P., and on the Chicago, St. P., M. & O. R.R.'s; southeast of the central part of the State and about 68 miles west by north of Sioux Falls. It was settled in 1879, and incorporated as a city in 1883. It is situated in an agricultural region in which wheat is one of the great crops, and considerable attention is given to raising stock for the eastern markets. The industrial establishments are railroad shops, machine shops, lumber and brick yards, stock-yards, a creamery, and grain elevators. Mitchell ships large quantities of wheat and live stock. The three banks have a combined capital of \$125,000. It is the seat of Dakota University, founded in 1885 under the auspices of the Methodist Episcopal Church, and it has good public and parish schools. There are nine church edifices. The government is administered under a general law charter of 1890, and is vested in a mayor who holds office two years, and a council of eight members, four of whom are elected each year. The waterworks are owned and operated by the city. Pop. (1890) 2,217; (1900) 4,055.

C. W. DOWNEY,

Editor *'Mitchell Daily Republican.'*

Mitchill, mitch'ill, Samuel Latham, American physician: b. North Hempstead, L. I., 20 Aug. 1764; d. New York 7 Sept. 1831. He was graduated M.D. at the university of Edinburgh in 1786, and in 1788 was a commissioner for treating with the Iroquois Indians for the purchase of land. In 1792 he was appointed professor of chemistry, natural history, and philosophy in Columbia College, where he first introduced the system of nomenclature invented by Lavoisier. In 1797 he founded with Dr. Edward Miller and Elihu H. Smith the quarterly 'Medical Repository,' of which he continued the editor for 16 years. It was the first scientific periodical published in the United States. In 1801 he became a representative in Congress, and in 1804 was chosen to the United States senate. At the expiration of his term of office he was again elected to the house of representatives. On the establishment of the college of physicians and surgeons he was appointed (1808) professor of natural history, becoming in 1820 professor of botany and materia medica. The institution in 1826 gave place to the Rutgers Medical School, of which Dr. Mitchill became vice-president. Though widely respected in his lifetime as a man

of extraordinary learning, he was occasionally the victim of the satirical wits of New York, and the poems of "Croaker & Co.," to which Fitz-Greene Halleck was a contributor, contain records of some of his eccentricities. He proposed to change the name of this country to "Fredonia," and wrote in 1804 "An Address to the Freedes, or People of the United States." He was one of the early supporters of Robert Fulton, whom he accompanied in 1807 in the first steamboat journey on the Hudson. He was the author of 'Observations on the Absorbent Tubes of Animal Bodies' (1787); 'Nomenclature of the New Chemistry' (1794); 'Life, Exploits, and Precepts of Tammany, the famous Indian Chief,' a half historical, half fanciful address before the Tammany Society of New York (1795); etc. Consult Francis, 'Reminiscences of Samuel Latham Mitchill' (1859).

Mite, formerly a term applied to a very small coin worth about one mill. The name was used for a small coin current in Palestine in the time of Christ.

Mit'ford, Bertram, English novelist. He has had a varied career; since 1873 largely South African. Among his published works are: 'Through the Zulu Country'; 'The Gun Runner'; 'The King's Assegai'; 'The White Shield'; 'The Sign of the Spider.'

Mitford, mit'ford, Mary Russell, English writer: b. Alresford, Hampshire, England, 16 Dec. 1787; d. Swallowfield, near Reading, Berkshire, 10 Jan. 1855. Her education was obtained largely through her very wide reading. Her first published work was 'Miscellaneous Poems' (1810). With the sketches 'Our Village,' descriptive of English rural life (first appeared in 'Lady's Magazine' (1819); collected 1824, 1826, 1828, 1830, 1832). She may be said to have originated a branch of literature. Among her dramatic works, five in number, 'Rienzi' (1828) was most successful; in America it became popular with Charlotte Cushman as Claudia. Included in her further writings are 'Recollections of a Literary Life' (1852), and the works of fiction 'Belford Regis' (1835) and 'Atherton' (1854), the latter highly praised by Ruskin. Her correspondence (published 1870) has been by some ranked almost with her books. Consult the 'Life' by L'Estrange (1870).

Mitford, William, English historian: b. London 10 Feb. 1744; d. Exbury 8 Feb. 1827. He was educated at Oxford, and obtained a commission in the Hampshire militia, of which he became colonel. His early fondness for Greek led him to the study of Greek historians, and he was induced, partly through the advice of Gibbon, a fellow officer in the same regiment, to undertake a 'History of Greece.' The 1st volume appeared in 1784; the 5th and last, bringing the narrative down to the death of Alexander the Great, in 1818. With considerable critical acumen and diligent research he elucidated many obscure points, and until the appearance of the works of Thirlwall and Grote, his history was considered of the highest authority. A strong prejudice against democracy leads him to speak of the Athenians as a horde of treacherous miscreants, of Demosthenes as a malignant demagogue, and of Philip as a perfect statesman and warrior. Mitford was professor of ancient history in the Royal Academy, and member of

Parliament for three boroughs in succession 1785-1818. Besides his principal work he published an 'Essay on the Harmony of Language' (1774) and lesser works.

Mithan. See GAYL.

Mithras, mīth'ras, in ancient mythology, the sun, or the genius of the sun, which was worshipped as a deity by the Persians, and at a later period also in Rome. Mithras stands as a mediator between Ormuzd and the world. He is commonly represented as a handsome youth, wearing the Phrygian cap, tunic, and cloak, and kneeling on a bull, into whose throat he is plunging the sacrificial knife. The bull is at the same time attacked by a dog, a serpent, and a scorpion. In Germany many tokens of its former existence are still to be found, as the monuments at Hedernheim, near Frankfort-on-the-Main, and other places.

Mithridates (mīth-rī-dā'tēz) VI., sur-named EUPATOR, and also styled commonly THE GREAT, king of Pontus: b. Sinope 134 B.C.; d. Pantacapæum 63 B.C. He ruled from 121 B.C. until his death. He early entered on his career of conquest, which ultimately involved him in war with Rome. He subjugated the peoples on the northern shore of the Euxine (Black) Sea, attacked Cappadocia and Bithynia, and since these were allies of Rome, there encountered Roman opposition. After the death of Sulla, 78 B.C., Mithridates levied another army to expel the Romans from Asia. Being defeated by Lucullus, appointed consul 74 B.C., he was followed by the victorious Romans into his own states, and driven to seek a refuge in Armenia, then ruled by Tigranes, who refused to deliver him up. Here Mithridates raised a third great army, and in 67 B.C. completely defeated the Romans; and, following up his success, rapidly recovered the larger part of his dominions. The Romans now invested Pompey with absolute power in the East, and by him, in 66 B.C., the forces of Mithridates were completely routed near the Euphrates. The king retired to Bosporus (the Crimea), where his troops, headed by his son Pharnaces, broke out in mutiny, and Mithridates killed himself. He was considered by Rome its most formidable enemy. He was a patron of art and science, and is said to have spoken 22 languages. See POMPEY; SULLA.

Mitla, mēt'lā, Mexico, a village of the state of Oaxaca, on the Mixtecan plateau, 26 miles southeast of Oaxaca. It is celebrated for its extensive ancient ruins which comprise five great groups of temples, palaces, tombs and other edifices covering about 2,000 feet square and respectively known as (1) The Catholic establishment; (2) the Columns; (3) the Arrows; (4) the Adobe; and (5) the South Side. They were elaborately decorated with admirable mosaic work in geometrical designs, and with pictographic mural paintings. The ruins of a fort of the same architecture dominate a hill a short distance west of the city, and in the vicinity are the quarries whence the stone for building the city was obtained. See MEXICAN ARCHEOLOGY. Consult: Saville, 'Cruciform Structures near Mitla' (1900).

Mito, mē'tō, Japan, a town in the island of Hondo, 7 miles from the east coast and 65 miles by rail northeast of Tokyo. It is a town of considerable antiquity and has played an im-

portant part in the history of the country. There is an old castle, now used for an educational institution, and some fine public gardens. The manufactures include cloth, paper, cigarettes, etc. Pop. (1898) 33,778.

Mito, or **Mytho**, French Indo-China. See MYTHO.

Mito'sis, or **Karyokinesis**, the process of indirect nuclear division of cells undergoing growth or beginning those changes in the egg which bring about the growth of an embryo. This is almost universal, but "amitosis," or direct cell-division occurs in pathological tissues and a few of the lowest organisms. The first stages are characterized by a rearrangement of the nuclear network into a series of loops or V-shaped bodies. Meanwhile a minute body in the cytoplasm, or extra-nuclear cell-contents, has divided into two, and the portions have arranged themselves at opposite poles, with the nucleus between them. Each of the two portions forms a star-like aggregation consisting of a centrosome with a radiating mass. The V-shaped bodies, or chromosomes, of the nucleus arrange themselves with their open ends outward and their closed ends near the centre, and they then separate along the central or equatorial plane, one-half proceeding to each centrosome, with whose rays it becomes incorporated and is firmly held. The cell then becomes constricted between the centrosomes, and in each of the two portions a new nucleus is developed by a process essentially the reverse of that just described. The final result is the formation of two daughter-cells out of the original mother-cell, each of which contains an exact half of the essential chromatin elements not only in respect to equal quantities, but in respect to those qualities, chemical or other, which constitute the inheritable individuality of the organism. For fuller information see CELL; EMBRYOLOGY; and consult the authorities cited under those titles.

Mitrailleuse, Fr. mē-trā-lī-ēz. See ORD-NANCE.

Mitral Valve. See HEART, THE.

Mitre, **Bartolomé**, bār-tō-lō-mā' mē-trā, Argentine soldier, politician, and author: b. Buenos Ayres 26 June 1821; d. there January 1894. He was the leader in the movement in which Buenos Ayres proclaimed itself independent 11 Sept. 1852, and was successively minister of the interior and of war in the Buenos Ayres government. The force commanded by him was defeated by Urquiza at Capeda 23 Oct. 1859, and Buenos Ayres was reunited with the Argentine Confederation. In May 1860 he was elected governor of Buenos Ayres. New troubles with the Confederation arose, and he defeated Urquiza at Pavon 11 Sept. 1861. In 1862 he was elected president of the New Argentine Republic to serve for 6 years, and after a very prosperous administration became minister to Brazil. His chief works are: 'Historia de Belgrano' (1857); and 'Historia de San Martin' (1884), of which there is an abridged English translation (1893).

Mitre, in ecclesiastics, a sacerdotal ornament worn on the head by bishops and other church dignitaries on solemn occasions, being a sort of cap pointed and cleft at top. There has been much controversy regarding the date at which the mitre became part of the official dress of bishops. Some have contended that the early

Christian church adopted with little change the head-dress of the Jewish priests. Three kinds are worn in the Roman Catholic Church, namely, the precious mitre, of gold or silver and ornamented with jewels; the *mitra auriphygiata* of gold cloth, without jewels (except pearls); and *mitra simplex* or plain mitre, of white silk or linen. Bishops and mitred abbots receive their mitres from the bishop who consecrates them. The Greek Church has no mitre. Since the Reformation the mitre has rarely formed a part of the costume of an English Church dignitary, but some bishops have worn it in quite recent times.

Mitre-shell, the shell of a gastropod mollusk of the genus *Mitra* and family *Mitridæ*, closely allied to the *Muricidæ*, so called because of its resemblance in form to a bishop's mitre. The shells are thick, somewhat fusiform, with the spire very high and acute, and a small aperture and operculum. The genus is a very large one, comprising several hundred species mostly from shallow, tropical seas, and especially abundant in the Malayan region. *Mitra episcopalis* is abundant on the tidal flats of the Philippine Islands. During the day, especially at low water, they burrow beneath stones or hide in crevices, but are active at night. They secrete a purple fluid having a nauseating odor, and act as scavengers. Consult Cooke, 'Cambridge Natural History,' Vol. I. (1895).

Mitsui, mēt-soo'ē, a name which has in Oriental financial circles a prestige similar to that of Rothschild in those of the West. The mercantile house of Mitsui and Co. was established by Takatoshi (1633-1706), and has been identified with almost every large concern of industrial and economic interest in Japan.

Mitylene, mīt-i-lē'nē, **Mytilene**, or **Lesbos**, a historic island of the Ægean Archipelago, off the northwest coast of Asia Minor, since 1462 belonging to Turkey, and called by them Midillii, while the Greeks generally call it *Mitluni* or *Mytilene*, from its capital. In shape it is nearly triangular, but on the south there are two deep and nearly land-locked bays: it has an area of 675 square miles, and a population (1901) of about 125,000. It is mountainous, but fertile, and is one of the finest islands of the Archipelago. The cultivated fruits include the olive, vine, fig, orange, pomegranate, apricot, pear, and apple. The olive is the most important crop, large quantities of oil being produced. Wine, for which the island was anciently famous, is still made, but after antiquated methods. The chief exports are oil, hides, wool, valonia, and fruits. There is excellent marble, deposits of iron, copper, alum, etc., and thermal springs utilized in the cure of rheumatism and nervous diseases. There are some tanneries, soap-works, numerous oil-mills, earthenware works, etc. The island anciently known as Lesbos was famous as a centre of Greek life and civilization. It formerly contained six cities, by far the most important being Mitylene and Methymna. It was early inhabited by Greeks of the Æolian race. Its inhabitants made an active resistance to the Persians, but were finally obliged to submit (about 540 B.C.). After the defeat of the Persians by the Greeks at the battle of Mycale (479 B.C.) it became the ally of Athens. During the Peloponnesian war it revolted from Athens, whereupon an Athenian

fleet was sent against it, the walls of Mitylene were demolished, and a thousand of the richest inhabitants put to death. The island itself was divided into 3,000 parts, of which 300 were devoted to the service of the gods, and the rest divided among the Athenians, by whom they were rented to the ancient proprietors. The cities, nevertheless, soon rebelled again. Alexander the Great made a treaty with the Lesbians after the battle of Granicus, and the island was afterward reduced by the Macedonians, and subsequently became part of the Roman province of Asia. It was placed by Constantine in the Provincia Insularum. In 1462 A.D., after belonging to a Genoese family, the island was taken by Mohammed II. During the War of Independence, the Turkish and Greek squadrons fought a battle off Mitylene 7 Oct. 1824, on which occasion the Turks were defeated and their fleet was destroyed. In consequence of strained relations between France and Turkey, a French fleet was sent to Mitylene 5 Nov. 1901; and remained there till the Porte agreed in full to the demands made. The Lesbians in ancient times were notorious for their dissolute manners, and the whole island was regarded as the abode of pleasure and licentiousness. At the same time they had the reputation of the highest refinement, and of the most distinguished intellectual cultivation. Poetry and music made great progress there. The Lesbian school of music was celebrated, and is said to have produced musicians superior to all the other musicians of Greece. Among these the most distinguished were Arion of Methymna, and Terpander of Antissa. Alceus and Sappho, both Lesbians, were esteemed the first in lyric poetry. Pittacus (one of the seven wise men), the philosophers Theophrastus and Theophranes (the bosom friend of the great Pompey), and the historians Hellanicus, Myrtillus, etc., were also natives of this island. It was often chosen as a place of residence by distinguished foreigners. Epicurus and Aristotle taught there.

Mivart, miv'art, **Saint George Jackson**, English naturalist: b. London 30 Nov. 1827; d. there 1 April 1900. He was educated at Harrow and King's College, London. Having joined the Roman Catholic Church in his 17th year, he therefore received his academic training in St. Mary's College, Oscott. In 1851 he was called to the bar at Lincoln's Inn, but the possession of ample means enabled him to gratify his taste for natural history. He was appointed lecturer on zoology in St. Mary's Hospital Medical School in 1862, and from 1874 till 1884 was professor of biology in the Roman Catholic University College at Kensington. On the invitation of the Belgian bishops he accepted, in 1890, the chair of the philosophy of natural history in the university of Louvain. Elected a fellow of the Royal Society in 1867, he was vice-president of the Zoological Society in 1869 and 1882, secretary of the Linnæan Society 1874-80 and its vice-president on two occasions (1880 and 1892). Dr. Mivart contributed a large number of papers to the leading reviews and to the proceedings of the learned societies with which he was associated, among the chief being those on 'The Structure of the Fins of Fishes,' 'The Osteology of Birds,' 'The Zoology, Anatomy, and Classification of Apes and Lemurs,' and his 'Memoir of the Insectivora.' He also published several important works on natural his-

tory subjects and the philosophical questions arising out of them. His best-known work is 'The Genesis of Species' (1871), in which, while fully admitting organic (though not mental) evolution, he argues against Darwin's theory of natural selection and attempts to explain the production of new species as due to an innate plastic power. Among his other works may be enumerated: 'Elementary Lessons in Anatomy' (1872); 'Man and Apes' (1873); 'The Common Frog' (1874, new ed. 1881); 'Lessons from Nature' (1876); 'Contemporary Evolution' (1876); 'The Cat' (1881), a good introduction to the study of the vertebrate animals, especially the mammals; 'Nature and Thought' (1883); 'A Philosophical Catechism' (1884); 'On Truth: A Systematic Inquiry' (1889), in which he discusses the ultimate basis of science; 'The Origin of Human Reason' (1889), in which he insists on the fundamental distinction between man and all other animals; 'Monograph of the Canidæ' (1890); 'Birds: The Elements of Ornithology' (1892), a useful introduction; 'Essays and Criticisms' (1892); 'Types of Animal Life' (1893), all vertebrate and mainly mammalian; an 'Introduction to the Elements of Science' (1894). The articles in the 9th edition of the 'Encyclopædia Britannica' on Apes, Reptilia (Anatomy), and Skelcton were from Mivart's pen. He published anonymously a novel, 'Henry Standon,' republished shortly after his death under the title 'Castle and Manor.' Mivart's contributions to the study of the vertebrate animals, though not of epoch-making importance, were always valuable and luminous. In the latter part of 1899 and the beginning of 1900 he expressed himself with considerable freedom regarding certain doctrines of the Roman Catholic Church, and on his refusal to sign a declaration of faith submitted to him was inhibited by Cardinal Vaughan from taking the sacraments of the Church.

Mixed Marriages, a name applied to marriages between persons of different religions. In the United States the term generally refers to a marriage between a Roman Catholic and a Protestant. In England a marriage between a baptized and an unbaptized person is ecclesiastically invalid; one between a member of the Catholic Church and of any other Christian communion is valid, but illicit, unless a dispensation is first obtained. In the 19th century mixed marriages led to serious dissensions in Europe. If a Roman Catholic and a Protestant desire to marry, they must, according to Roman Catholic practice, promise that the children shall be brought up in the Roman communion; the bishop may then grant a dispensation and the marriage, without the nuptial benediction, must be performed by a Roman Catholic priest without any repetition of the ceremony by a Protestant clergyman. See also MARRIAGE AND DIVORCE.

Mixosau'rus, a genus of small fish-lizards (*Ichthyopterygia*) from the Triassic formations of Europe, differing from typical ichthyosaurs by their fewer teeth and some minor characters.

Mixtec, mēs-tāk', or **Mistec**, a Mexican tribe of Indians of the Zapotecan stock occupying the coast of Guerrero. They are highly skilled in agriculture and the simpler arts, have built cities and temples of hewn stone, and

MIZPAH — MOABITE STONE

possess a hieroglyphic literature, keeping a calendar like the Aztec tribes. They are noted for their pottery and woven products.

Mizpah, miz'pa, or **Mizpeh**, the name of several places in Palestine. The word signifies a high place, or lookout. Mizpeh of Gilead (Gen. xxxi. 29) is still pointed out with its group of rough stone monuments in the village of Sûf. — The Mizpeh of Benjamin (Josh. xviii. 26, etc.) lay north of Jerusalem on an unknown site. — That of Judah (Josh. xv. 38) stood in the low hills northeast of Lachish. Nothing is positively known of the Mizpeh of Moab (1 Sam. xxii. 3).

Mjøsen, myé'sën, **Lake**, Norway, situated in a picturesque and fertile valley, 36 miles northeast of Christiania, is the largest lake in the country. It is 62 miles long, with a maximum breadth of 10 and an average breadth of two miles. It is exceptionally deep, having a maximum depth of 1,460 feet. It is fed by the Laugen River and drains into the Glommen through the Vorma. There are numerous popular summer resorts on its shores.

Mnemonics, a system of artificial aids for assisting the memory. Such methods have been in use for many years. They consist in the main of some mechanical scheme or framework which, by association, is linked with what one desires to memorize. One of the oldest forms of verbal mnemonics is contained in the familiar lines, "Thirty days hath September, April, June and November," etc.; and many similar devices are known. The medical student has an unlimited number of mnemonic aids whereby to remember the names of the muscles, to call to mind the relations of important viscera, and to determine accurately the order of the cranial nerves. Students of logic have for years made use of mnemotechnic devices to remember the parts of the syllogism. (See **LOGIC**.) Some of these devices are based on topical association, whereas others depend on number and letter relations, and a great many which have been in vogue in recent years are based upon sound and rhyme relations. A general criticism that can be made of most of these memory-schemes is that the processes are purely mechanical, and that one of the fundamental features in memory, that is, memorizing for the sake of idea-relation, is given up for the sake of word-relation. For certain classes of students and for certain lines of work these mechanical schemes may be of much service; for salesmen, for instance, who need to bear in mind immense quantities of goods with their wholesale, retail, and discount prices. But as a process of general culture, improving mind-facilities, so called, mnemotechnics are mechanical. See **MEMORY**.

Mnemosyne, nē-mös'i-nē, in Greek mythology, the mother of the nine muses of Zeus. She was a daughter of Uranus.

Mo'a, one of a race of extinct ratite flightless birds of New Zealand, forming the family *Dinornithidae* and composed of several genera (see **DINORNITHES**) ranked between the apteryx and the epornis. They had comparatively small heads, small eyes, bills of varied form, great legs, wings almost or quite wanting and the head and neck bare. The feathers of the body were rounded, loose in part downy, with great after-shafts. Some of the feathers were black with

red-brown bases and white, others blackish brown or yellowish. They varied in size from that of a turkey (*Anomalopteryx parva*) to that of the huge *Dinornis maximus*, 12 feet in height. The remains of these birds are found in sand-dunes, bogs, caves and places where the aborigines had fed upon their flesh. Not only bones, but pieces of skin, ligaments, feathers and eggs have been recovered. It is probable, indeed, that these birds became extinct only four or five centuries ago. The Maori traditions recount the wars of extermination which their early ancestors waged with the moa; and the natives profess to show the spot where the last one was killed. Clearer traditions say that the habits of the birds were sluggish, but their disposition fierce. They lived in pairs, fed upon green shoots and fern-roots and made rude nests on the ground. Their anatomy was elaborately described in a memoir by Owen, 'Extinct Birds of New Zealand' (London, 1879), and a general account of them may be found in Newton's 'Dictionary of Birds' (1896).

Moab, mō'āb, the ancestor of a Semitic people who occupied a region east of the Dead Sea and the Jordan from an early period till the Christian era. In the Old Testament (Gen. xix. 37) he is said to be the son of Lot by his elder daughter. The "plains of Moab" spoken of in Numbers are the hot plains of the Jordan Valley. The region to which the Moabites were confined by the Amorites was strongly fortified on every side by nature, and was noted for its rich pastures and its wine. The institution of monarchy was of much earlier introduction among the Moabites than among the Israelites, but the religion of Moab seems to have been very similar to that of their more celebrated neighbors and kinsfolk. Their supreme god was Chemosh, who held among them much the same position as Jehovah among the Israelites, and they seem to have had something akin to the priesthood and general theocratic organization of the Israelites. The Moabites were harassed by the Assyrians, but at one period they assisted the latter against the Jews. Moab is mentioned about the 6th century A.D., but the people, as distinct from their neighbors, have long passed out of existence. The extensive ruins which now cover their country bear witness to their former greatness. The language of Moab was closely akin to that of Israel.

Mo'abite Stone, in archæology, a monument of black basalt, about 3 feet 8½ inches high, and 2 feet 3½ inches wide, and 1 foot 1¾ inches thick, with rounded top but square base, on which there is an inscription of 34 lines in Hebrew-Phœnician characters, discovered in 1868 by F. A. Klein at Dhiban in the ancient Moab, just north of the river Arnon. An attempt made to purchase it led to a quarrel among the Arabs of the district, and the stone was destroyed partially by being heated and then by throwing water upon it, which caused it to break into three large and several small pieces. The larger pieces were secured for the Louvre by M. Clermont Ganneau, an official connected with the French embassy at Constantinople, who was also fortunate in obtaining a paper impression of the inscription before the stone was broken. The inscription dates about 900 A.C., and is the oldest known in the Hebrew-Phœnician form of writing. It was erected by

MOALLAKAT — MOBILE

Mesha, king of Moab, and is a record of his wars with Omri, king of Israel, and his successors. The narrative also treats of Mesha's wars against the Edomites. Consult Ginsburg, 'The Moabite Stone' (1870).

The Moabite Stone.

Moallakat, mō-āl-lā-kāt'. See ARABIA, Literature.

Moaria, in geology, a name applied by Mantell to a hypothetical southern continent, the home of the moa. The supposition is that New Zealand, Chatham, Philip and the Auckland islands, and other Polynesian islands are the remains of this submerged continent. The assumption of the existence of such a continent, as is the case with Lemuria (q.v.), is for the purpose of explaining the distribution of the species.

Moawah, mō-ā-wē'yā. See CALIPH.

Mobangi, mō-bāng'gē. See UBANGI.

Moberly, mō'bér-lī, Mo., city, in Randolph County; on the Wabash and the Missouri, K. & T. R.R.'s; about 125 miles northwest of St. Louis. It is an agricultural region, and in the vicinity are valuable deposits of fire-clay, and also extensive coal fields. Some of its industrial establishments are the machine-shops of the Wabash Railroad, flour and lumber mills, ice factory, grain elevator, foundry and machine-shops, brick and lumber yards. The trade is chiefly in live-stock, poultry, wool, tobacco, dairy products, hides, and the local manufactures. It is the seat of St. Mary's Academy, and has public and parish schools and a public

library. It has also a Young Men's Christian Association building. Pop. (1890) 8,215; (1900) 8,012.

Mobile, mō-bēl', Ala., city, seaport, county-seat of Mobile County; on the Mobile River at its entrance into Mobile Bay, 33 miles from the Gulf of Mexico; 141 miles by rail from New Orleans, 180 from Montgomery, 104 from Pensacola. It is on the Southern, Louisville & Nashville, Mobile & Ohio, Mobile & Bay Shore, and Mobile, Jackson & Kansas City R.R.'s. Commercially and historically, Mobile is one of the most important and interesting cities of the South. It is one of the leading cotton markets and shipping points of the country, the natural centre of the Alabama-Tombigbee cotton region. A semi-weekly line of large freight steamers plies up the Alabama to Montgomery, 410 miles, and to Demopolis, at junction of Tombigbee and Warrior rivers, and smaller vessels ascend the Warrior to Tuscaloosa, and at high water to Columbus on the main stream, navigable the year round. The exports include cotton, cottonseed-oil, fruits, coal, lumber, live stock, meat, tar, turpentine, and rosin, etc.—a total of over \$12,000,000 a year. The exports for the year ending 1 Sept. 1903, were \$12,600,000, and the imports \$4,170,000, largely tropical fruits, coffee and sisal. There are manufactures of great diversity, with a product in 1903 of about \$5,500,000, and employing 3,500 persons. Headed by lumber and timber products from the Alabama forests, they comprised also grist milling, foundry and machine work, ship and boat building, shingles, boxes, barrels, baskets, cigars, confectionery, saddlery and harness, brooms and brushes, brick, baking and yeast powders, malt and distilled liquors, ice, etc.

Topography.—The city is built on a level sandy plain about 15 feet above the bay, rising gradually to low hills, and furnishing good drainage; the streets are mostly rectangular, broad and finely shaded. The "shell road," skirting the bay, and Government Street, are noted drives; and there are three parks, Washington, Bienville, and Monroe. Near by on the south and west are dry, sandy pine hills, agreeable retreats during the hot season; and across the bay in Baldwin County, called the eastern shore, are many summer resorts. The water supply is so pure that it is used for chemical purposes without filtering; it comes from two sources,—Spring Hill 5 miles distant, Clear Creek 11 miles. The sanitary condition of the city has vastly improved and the yellow fever, once a frequent visitor, has entirely disappeared. The death rate in 1900 was 25.9.

Public Buildings.—The chief structures are the government building, which cost \$250,000, the court-house, Cotton Exchange and Chamber of Commerce, the Masonic Temple, Odd Fellows' and Temperance Halls, the Battle House, Bienville Hotel, Athelstan Club and one of the best arranged markets in the south, the United States Marine Hospital, the city hospital, the Providence Infirmary, and the cathedral of the Immaculate Conception, and several handsome churches of different denominations. The United States court for the Southern District of Alabama has its seat here. The educational institutions include a splendid free school system which occupies the Barton Academy and other buildings in various parts of the city, the Col-

BIENVILLE SQUAKE, MOBILE

MOBILE—MOBILE BAY

lege of Saint Joseph, Spring Hill College a few miles west (Roman Catholic, 1830), McGill Institute, Evangelical Lutheran Institute, Convent and Academy of the Visitation, Medical College of Alabama (1859), Saint Mary's School, and three public libraries,—the Public, Mobile (subscription), and the Y. M. C. A.

There are three daily and several other newspapers. The mayor, a council, and a board of aldermen at large, are elected for three years; they form a General Council which elects the other officers. The assessed valuation in 1900 (basis of $\frac{1}{2}$) was about \$16,000,000; net debt \$822,000. Tax rate \$20.50 per \$1,000.

Trade and Commerce.—The fiscal year ending 30 June 1903, marked the banner year in Mobile's foreign trade, exceeding that of the previous record year, which ended June 1902, by over \$500,000, the total trade, imports and exports, for the 12 months of 1902-03 reaching the total of \$16,790,000.

The trade with Cuba, West Indies, and Central America continues large. The exports to those countries for fiscal year ending 30 June 1903 being nearly \$4,000,000, and the imports over \$5,000,000. It is noticeable in the export trade of Mobile that the increase in value of cotton and lumber exported in 1902-3 is \$1,534,000 over 1901-2.

The export and import trade of Mobile in 1893-4 was \$3,475,803; in 1902-3 was \$16,790,000, an increase of nearly 500 per cent in 10 years.

In 1888 Mobile had but 17 feet of water in the channel from the lower bay to the city. In that year the government began the project of deepening the channel to 23 feet; this was completed to 22 feet in 1901, and to 23 feet in 1903.

There is now 24 feet of water on the outer bar at the entrance to Mobile Bay, which will be deepened to 30 feet by July 1904. There is from 30 to 40 feet of water in the lower bay, which is a safe, land-locked harbor. There is no record of any vessel having been lost by storm in Mobile Bay or harbor.

Mobile is the third largest importer of tropical fruit in the United States. Its vegetable and truck farming interest is also very large. Its fish and oyster business is of much importance and increasing all the time.

Mobile's timber trade is very large, the mills in the territory having a capacity of 1,200,000,000 feet yearly, which is exported through this port to every port of the world.

History.—Mobile Bay was the original seat of French colonization in the Louisiana territory. Iberville founded a temporary settlement at Biloxi in 1699 and in 1702 he removed it to the Mobile River 27 miles above the bay, where occurred the famous "petticoat insurrection" of the women against too much corn-meal diet. A monument was erected there on the bi-centennial of Mobile's foundation. In 1711 a hurricane and flood nearly destroyed the place, and the settlement was removed to the present site. It remained the capital till 1722, when New Orleans was given that position. In 1763 Mobile passed into British hands, and they changed the name of its Fort Condé to Fort Charlotte; in 1780 the Spanish general Galvez captured it, and it was confirmed to Spain by the treaty of 1783. On 13 April 1813 it was captured by the American Gen. Wilkinson; Fort Bowyer at the mouth of the bay was

retaken by the British, but again given up. It was incorporated as a town 20 Jan. 1814, as a city 17 Dec. 1819. In 1818 the Bank of Mobile was founded, which in the panic of 1837 was one of the only four United States banks which did not suspend; the same year (1818) steamboats were operated on the rivers. In 1839 it was nearly destroyed by fire and ravaged by yellow fever, again in 1852 by flood and fever. On 4 Jan. 1861 the State authorities took possession of Forts Morgan and Gaines in the harbor, though the State did not secede till the 11th. Mobile is the only American city which has been under five sovereignties. In August 1864 Farragut entered the harbor past the fire of the forts, amid mines and torpedoes, and after a heroic battle destroyed or captured the Confederate fleet including the ram Tennessee, and in co-operation with Gen. Gordon Granger captured the forts. The city was not taken until 1865, just before the surrender. The government afterward carried on great improvement works in the harbor, deepening its 13 feet of channel to 21 feet. Owing to Reconstruction finance, the city became bankrupt, and on 11 Feb. 1879 its charter was canceled and the name changed to Port of Mobile; on 10 Dec. 1886 a new charter was given and the old name restored.

Population.—(1785) 746; (1813) about 500; (1820) 1,500; (1830) 3,194; (1840) 12,672; (1850) 20,515; (1860) 29,258; (1870) 32,034; (1880) 29,132; (1890) 31,076; (1900) 38,469, of whom 17,067 were colored; and in 1903 about 60,000, including the suburbs.

L. F. IRWIN,

Secretary Mobile Chamber of Commerce.

Mobile, a bay on the southeast coast of Alabama, which is really the estuary of the Tombigbee and the Alabama rivers. That part of the estuary to which the name of Mobile Bay is applied is about 30 miles long and from 9 to 12 miles wide. At the entrance to the bay are long narrow strips of land, almost obstructing the entrance. On the east, at Mobile Point, is a revolving light; on the west, on Dauphin Island, are Forts Morgan and Gaines. Between Dauphin and the mainland is Grant's Pass, a strait connecting Mobile Bay with Mississippi Sound. The United States government has improved the harbor, and from a shallow entrance, which was a hindrance to navigation, there is now a channel through which vessels drawing 23 feet and over can enter, and vessels drawing 17 to 23 feet can ascend to the wharves of the city.

Mobile, a river in Alabama, the name given to the western stream or mouth of the river formed by the junction of the Alabama and Tombigbee rivers. The eastern stream or mouth is called the Tensas. From the junction of the rivers to the head of Mobile Bay is, in direct line, about 25 miles, but the winding of the stream makes its course about 50 miles long. The Mobile and Tensas communicate at several points, but the two streams enter the Mobile Bay at the city of Mobile, by the same delta.

Mobile Bay, Battle of, a battle of the Civil War fought 5 Aug. 1864. Mobile Bay is divided from the Gulf of Mexico by Mobile Point east and Dauphin Island west, about three miles apart; but the ship-channel of less than 2,000 yards, narrowing to 750 outside, closely skirts Mobile Point. The latter was defended

MOBILIAN TRADE LANGUAGE — MOCKING-BIRD

by Fort Morgan; the island by Fort Gaines, too far from the channel to be very formidable. Between them stretched a line of piles and torpedoes, but leaving a narrow channel for blockade-runners, marked off by a red buoy. Within was the Confederacy's most powerful ram, the Tennessee, and three small unarmored paddle-wheel gunboats. Farragut's Federal fleet (in order of battle) comprised the monitors Tecumseh, Manhattan, Winnebago, and Chickasaw, forming an inshore column; and the wooden sloops of war Brooklyn, Hartford (flagship), Richmond, Lackawanna, Monongahela, Ossipee, and Oneida, forming an outer one, each with a smaller mate lashed to the port side, to insure passage through if the starboard vessel's machinery should be disabled. Farragut would have led in the Hartford, but the Brooklyn had machinery for picking up torpedoes. The advance began at 5:30 A.M., and firing at 7:05; the instructions were to keep east of the red buoy, but the Tecumseh went west and was sunk by a torpedo. The Brooklyn stopped in fear of a like disaster, and the Hartford with Farragut passed her and led the fleet into the bay. Each vessel received much damage from Fort Morgan, but they silenced its guns by destructive fire, and all succeeded in anchoring three miles up. One Confederate gunboat was then sunk, one captured, and one took refuge next the fort; the Tennessee was to be attacked after dark, but itself assailed the flagship, and after a desperate fight was disabled and surrendered. The Lackawanna collided with the Hartford and nearly sunk her. The Union fleet lost 52 killed, 170 wounded, and 113 drowned in the Tecumseh; the Confederates 10 killed, 16 wounded, and 280 prisoners, besides the casualties in the fort. Both forts surrendered a few days later. The Union fleet carried 150 guns, and the officers and crews numbered 3,000 men. The Confederate fleet carried 22 guns and 470 officers and men.

JOSEPH T. DERRY,
Author of 'History of Georgia.'

Mobilian Trade Language, an Indian jargon, used in the Gulf States and Northwest. It is based upon Choctaw, with additions from numerous other dialects. The early French colonists called it *Mobilienne*, from the city of Mobile, which was formerly a great trading centre of the Gulf region. The language was spoken in Louisiana as late as 1850.

Mobilier, Cr dit. See CR DIT MOBILIER.

Moc'casin, Moccason, Mocassin, or Mocassin, originally a deerskin sandal, the sole and upper of which are formed of one piece of leather. It was formerly the ordinary foot-covering worn by the North American Indians. In recent times fancy moccasins are made for the general shoe trade, all kinds of leather being utilized for the purpose.

Moccasin-flower, a name for the American orchids (q.v.) of the genus *Cypripedium*, especially the large pink *C. acaule*, given to them by the Indians in allusion to the shape of the inferior part of the flower. Lady's-slipper is a common English name of the same import. See ORCHIDS.

Moccasin Snake, or Cotton-mouth, a large venomous serpent (*Ancistrodon piscivorus*) of the rattlesnake family, but having no rattles, the tail ending only in a horny spike, like that of

its near relative, the copperhead (q.v.), sometimes called "upland moccasin." It inhabits river-banks, swamps, and fresh-water marshes throughout the southern half of the United States, swarming in some regions, like the Everglades of Florida, or the half-flooded woods of lower Louisiana, and constantly invading the rice-fields. Elsewhere it is not greatly to be feared, as it rarely leaves the edge of the water, where it is fond of lying upon some low overhanging bush or floating log, ready to drop upon the fishes and frogs, which form its principal food, and which it pursues with great speed in and under the water. It often reaches a length of four feet, and its bite is deadly, the widely opened mouth in the act of striking showing cottony white. Its color is a dark reddish brown, obscurely marked with blackish, and with white blotches on the lips and abdomen. Eight or ten young are produced annually, viviparously; and these are frequently captured, but never yield any of their native sullen ferocity. One of the most complete biographies of this snake is that by Stejneger in the 'Annual Report' of the Smithsonian Institution for 1893.

Mocha, m 'ka (Arabian, m 'h ), or **Mokha**, Arabia, a fortified seaport, the former capital of Yemen, on the Red Sea, 130 miles northwest of Aden. During the 16th and 17th centuries Mocha was the chief port and emporium from which the coffee of Yemen was exported, whence the proverbial term, "Mocha coffee." The trade has been diverted to Hodeida and Aden. Pop. about 4,800.

Mock Orange, a name applied in England to the *Syringa* (q.v.), and in the United States to the *Prunus caroliniana*, a small evergreen resembling the cherry-laurel.

Mocker-nut, a species of hickory (q.v.).

Mocking-bird, a familiar and celebrated songster of the southern part of the United States (*Mimus polyglottus*), representing a genus of thrush-like wrens, many other species of which are known in Mexico, Central America, and West Indies. The plumage of all is bluish-gray and white, with no striking ornaments but much elegance of outline and tint. Their habits differ little from those of thrushes and other migratory, insect-eating birds, but they show great courage in defending their nest, placed usually in a bush or small tree, against cats, snakes, and similar enemies. The young, when taken from the nest for domestication, should be removed at an early period; or if taken later, they are generally removed by means of trap-door cages. The ordinary song notes of the mocking-birds are clear, bold and varied. They sing during the night, like the nightingales, and appear to begin their song with the rising moon. The imitative notes of these birds are, however, still more varied than their natural tones. They mimic with success the songs of their feathered neighbors, and with such exactitude as to deceive the ear of the most experienced sportsman. When they are kept in confinement all the sounds of the household, as well as the mewling of cats, the barking of dogs, the cry of an injured chicken, and the screech of the hawk, are all exactly imitated. They are hardy and require only ordinary care and attention to live contentedly for many years in any moderate climate. The mountain mocking-bird (*Oroscoptes montanus*) of the Rocky Mountain re-

1. Motmot.

3. Mouse-bird.
4. American Mockingbird.

gion; and the various "thrashers" (q.v.) are relatives not greatly inferior in song; while the mocking-wren (sec WREN) is a more distant relative highly gifted in imitative powers.

Mock'ler-Fer'ryman, Augustus, English military expert and author: b. Ireland 1856. He was educated at Cheltenham College and Sandhurst; entered the army in 1876; was instructor in fortification (1892-7) and in military topography (1897-1900) at Sandhurst, where he became professor of the latter subject in 1900. He has published 'Up the Niger, Narrative of Maj. Claude Macdonald's Mission' (1892); 'In the Northman's Land' (1896); 'British West Africa' (1898); 'Annals of Sandhurst' (1900); 'British Nigeria' (1902); technical articles, etc.

Mod'der, or Kaiba, River, South Africa, a tributary of the Vaal River, joining the latter about 30 miles above its confluence with the Orange River. It has an eastward course of over 180 miles. It came into considerable prominence during the Boer war of 1899-1902; along its banks at Maagersfontein the British were driven back with great loss in 1899, and at Paardeberg, the Boer general Cronje surrendered in 1900.

Mode, in music, (1) the manner of arranging the tones and half-tones in a scale, this general designation being always accompanied by a qualifying adjective, as Dorian mode, minor mode. Greek music, from which our modern music has been evolved, had an elaborate system of nine modes, which were afterward extended to fifteen. Authorities vary considerably as to the differences between the modes; it is certain, however, that they were the outgrowth of an earlier Greek music, the basis of which was the tetrachord. A tetrachord is a short scale of four notes, one of the intervals being a half-tone and the others whole tones, for example:

(A) Dorian tetrachord, half-tone, $\frac{1}{4}$; (B) Phrygian tetrachord, half-tone, $\frac{2}{3}$; (C) Lydian tetrachord, half-tone, $\frac{3}{4}$.

The slur indicates the half-tone.

The tetrachords were probably named after the people that originated them.

Until the time of Terpander (7th century B.C.) all Greek music seems to have been confined to the limits of a tetrachord. The lyre, which was then used merely to give the singer the pitch, had but four strings, each capable of sounding but one note. It was tuned in one of the ways shown above, though the notes written should be understood to be merely relative, each singer tuning his lyre to suit his own voice.

Terpander increased the compass of the lyre by adding a second tetrachord to the first, using the highest note of the first for the lowest of the second, thus making an incomplete scale of seven notes.

Terpander's Seven Note System.

The middle note, A, belonging to both tetrachords, was called *Mese* (middle) and had

somewhat the function of our modern keynote. It will be noted that the two tetrachords are both Dorian, which was the characteristic and favorite Greek tetrachord rather than the foreign Phrygian or Lydian.

Pythagoras (582 B.C.) is the reputed author of the octave system (the foundation of our modern system). He probably learned it during his visit to Egypt, where it is said to have been in use for many centuries before. By this system the two tetrachords, instead of having a note in common, were separated by a whole tone, called the *diatonic* tone or tone of disjunction.

Pythagoras' Octave System.

A was still the keynote or *Mese*, though no longer the middle or connecting note. Terpander's was called the *conjunct* system and Pythagoras' the *disjunct* system. The latter as above printed constituted the Dorian mode, which may be defined as two Dorian tetrachords separated by the *diatonic* tone, embracing the compass of an octave. Terpander's system not having this compass, cannot strictly be called a mode. Music seems to have developed on both these systems simultaneously in Greece, though finally that of Pythagoras supplanted Terpander's and became universal.

By replacing the two Dorian tetrachords with two Phrygian or two Lydian the modes of the same name were formed.

Lydian Mode.

These three were the principal modes. Each had two auxiliary modes, one commencing a fourth below and distinguished by the prefix *hypo*, the other commencing a fourth above with the prefix *hyper*. The complete list of the nine original modes is as follows:

- I. Dorian.
- II. Phrygian.
- III. Lydian.
- IV. Hypodorian or *Æolian*.
- V. Hypophrygian, Ionian or Iastian.
- VI. Hypolydian.
- VII. Hyperdorian or Mixolydian.
- VIII. Hyperphrygian or Locrian.
- IX. Hyperlydian.

A convenient way to remember them is to imagine a series of scales, all of natural notes, and an octave in compass, beginning on each of the seven natural notes. It should be remembered that the pitch is entirely relative; each of these modes might begin on the same actual sound. The *Mese* or *Keynote* is the fourth note of each scale.

On examination it will be seen that the three Dorian modes are each formed of two Dorian tetrachords, the three Phrygian modes of two Phrygian tetrachords, and the three Lydian

MODE

modes of two Lydian tetrachords. In the three principal modes the diazeutic tone separates the tetrachords. In the hypo-modes it is the low-

est note and in the hyper modes it is the highest note. In all the hypo and hyper modes the tetrachords are conjunct like those of Terpander. It will be seen that two of the hypos correspond exactly with two hypers, namely, the hypophrygian and the hypodorian are the same as the hyperlydian and the hyperphrygian. It will be observed, however, that the arrangement of the tetrachords and the diazeutic tone are not the same.

Each mode was said to have its characteristic quality or sentiment; the Dorian seems to have been the favorite one for heroic utterance, while the Lydian was said to be languishing and erotic.

The modes were afterward increased to fifteen, at least three of which were mere transpositions by octaves of earlier modes. In fact some theorists hold that the later development of the Greek modes completely changed their original significance and that instead of their being different arrangements of whole and half tones in a scale they were all identical in formation and were in fact merely Dorian modes of different pitch. If this is so they should not be called modes at all, but keys, as in modern music. The titles of the modes seem to contradict this theory, but the subject is so confused and the different theories so difficult of proof that wide differences of opinion will probably always exist. The complete list of the fifteen modes is as follows, the pitch given being said to be the accepted one for each mode (or key):

Fourths below	Originals	Fourths above
Hypodorian (A)	Dorian (D)	Hyperdorian or Mixolydian (G)
Hypoionian (Bb)	Ionian or Iastian (Eb)	Hyperionian (Ab)
Hypophrygian (B)	Phrygian (E)	Hyperphrygian or Locrian (A)
Hypoaeolian (C)	Aeolian (F)	Hyperaeolian (Bb)
Hypolydian (C#)	Lydian (F#)	Hyperlydian (B)

The Greeks had in addition three kinds of chromatic modes and an enharmonic mode.

They were all modifications of one or both of the interior tones of the tetrachord, the outer tones of which were never allowed to change their relative pitch. These modes had no significance in the history of music and were not adopted by the Romans.

The following are examples of Pythagoras' original Dorian mode changed to (a) chromatic and (b) enharmonic:

The X is used to represent a sound one quarter of a tone higher than the one preceding it.

The Gregorian or ecclesiastical modes are based on the Greek modes, though many errors and changes of names were made in arranging the system. St. Ambrose, bishop of Milan, chose four of the ancient modes which he named Authentic. Gregory the Great is said to have added four others called Plagal. Six more were afterward added, making fourteen, two of which were declared imperfect and rejected. There are two kinds of Gregorian modes, the Authentic and the Plagal. The final or keynote of the authentic modes is the lowest note of its scale. Each authentic mode has an attending plagal mode, a fourth below it, the keynote of which is the same as that of the authentic mode. The plagal modes are therefore similar in this sense to the Greek modes, the fourth notes of which were said to be keynotes. The Gregorian modes are numbered, the authentic receiving the odd and the plagal the even numbers. In addition, the old Greek names are used, the plagal modes receiving the prefix hypo, but unfortunately the Gregorian and Greek titles do not correspond, causing great confusion in all references to the modes. Thus, the Gregorian Hypophrygian is the same as the Greek Hyperdorian, and the Gregorian Hypomixolydian with the Greek Phrygian.

As in the Greek modes it is convenient to remember the Gregorian modes by imagining a series of scales, all of natural notes and an octave in compass, beginning on each of the seven notes. These are the authentic modes from which the plagal with their prefix hypo can be readily counted. (It should be remembered that the pitch is entirely relative as in the Greek scales.)

The Gregorian modes are still in use in the Roman Catholic Church, to the services of which it adds a remarkable effect of antiquity and solemnity.

MODEL — MODENA

In modern music but two of the old modes remain; the major, equivalent to the Greek Hypophrygian (or Hyperlydian) and the Gregorian Ionian, and the minor, equivalent to the Greek Dorian and the Gregorian Æolian. The choice of these two modes took many centuries and must have been made by entirely unconscious perception of their greater value especially of that of the major scale. A comparison of the major scale with the favorite Dorian mode of the Greeks shows that the modern ear desires the half tone at the top of a tetrachord instead of the bottom, as they did. Whether the favor in which the Dorian tetrachord was held by the Greeks is a proof that they thought their music *downward* and were therefore doing just the same as we do when we think ours *upward* is very doubtful, though a well-known theorist has advanced this clever idea. It is much more likely that the introduction of harmony caused a greatly increased recognition of the true function of the keynote, which, as we understand it, was unknown to the ancients. To us the keynote (in any octave) is the only rest point to the ear; all other notes of the scale trend toward it more or less strongly, and in the instance of an ascending major scale the seventh note (the so-called leading note) demands it more than any other note. This quality of motion and rest led to the greater importance of the major mode over the minor, the seventh note of which, being a whole tone distant from the keynote, lacked the great desire to progress these which is so important a characteristic of the major. Finally, probably by accident at first, the seventh note of the minor was raised so as to be but a half tone below the keynote; this form of the minor key is now known as the "harmonic minor," and is the only one recognized in harmony.

But the distance from the sixth to the seventh being thus made a tone and a half, a very difficult interval to sing or treat melodically, the sixth was raised to secure a smoother and easier passage upward and as the double change had made the upper part of the minor mode identical with the major it was argued that neither leading note nor raised sixth was necessary in descending, so both were restored to their original position in descending. This is known as the "melodic minor."

(2) A term used in mediæval music to indicate the relative value of the Large, the Long and the Breve. Two kinds of mode existed, great and less, the first deciding the relation of the large to the long and the second that of the long to the breve. Both kinds could be perfect or imperfect. In great mode perfect the large is equal to three longs. In great mode imperfect it was worth but two longs. In less mode perfect the long was equal to three breves, in less mode imperfect it was equal to two breves.

During the end of the 15th century and the beginning of the 16th musicians made extraordinary difficulties in their compositions by means of mode and prolation.

GEORGE GORDON THUNDER.

Model, in art, an original of any kind proposed for copy or imitation. Models in imitation of any natural or artificial substance are usually made by means of molds of plaster of Paris. In painting this is the name given to a man or woman who is procured to exhibit him or herself in the requisite costume, or in a state of nudity, for the advantage of the students. These models are provided in all academies and schools for painting. In sculpture a model implies a figure made of clay, wax, plaster, or any other suitable substance, which the artist molds to guide him in fashioning his work as the painter first makes a sketch, or the architect a design.

Modena, mô'dě-nā, Italy, a city and province, part of a former duchy now comprised partly in the compartimenti of Emilia and Tuscany.

The city, capital of the province, pleasantly situated in a fertile plain, between the Secchia and the Panaro, 25 miles northwest of Bologna, is built with great regularity, and has spacious streets, and fine promenades on the site of its former ramparts. It consists of three parts—the citadel, the old town, and the new town. The most remarkable edifices and establishments are the cathedral, a fine specimen of Romanesque, adorned in front with numerous curious sculptures; the Campanile, erected in 1224-1319, 335 feet high, and one of the finest in North Italy; the church of San Francisco, a handsome Gothic structure, containing a fine terra cotta group of the Descent from the Cross, by Begarelli; several other churches; the ducal palace, begun in the 17th century, but enlarged by numerous modern additions, and forming a splendid structure, now used as a military school; the Albergo Arti or building containing the municipal collections, especially the Estense Library of over 150,000 works, including several thousand MSS., and the picture-gallery embracing a large collection of paintings, several of them by the first masters; the theatre, the baths, the university, several other important educational institutions, and charitable endowments. The manufactures consist chiefly of silk goods, silk twist, woolen and hempen cloths, leather, and glass; the trade, however, is unimportant. Modena is the sec of an archbishop, and possesses various important public offices. It existed under the Etruscans, and as Mutina rose to great splendor under the Romans. It afterward was repeatedly sacked by the northern invaders, whose ravages left few vestiges of its ancient grandeur. Pop. (1901) 64,843.

The former duchy bordering on Tuscany, Lucca, Bologna, Mantua, and Parma, had an area of 2,573 square miles, which in 1901 contained a population of 785,930. It is now divided into the provinces of Modena and Reggio in the compartimento of Emilia, and the province of Massa e Carrara in the compartimento of Tuscany. Modena was made a duchy in 1452 the ruler being Duke Borso of the house of Este, to which noble family Modena had belonged since 1288. In 1796 the French took possession of the country and Modena afterward

MODERN ATHENS—MOELLER

was included in the Cisalpine Republic. By the treaty of Vienna in 1815 it was restored to the Este family. The duchy took an important part in the turbulent proceedings of the 19th century, which led to the consolidation of the Italian kingdom in 1860, when Modena proper was formed into a separate province with an area of 1,002 square miles. Pop. (1901) 315,804. See ITALY.

Modern Athens, a euphemistic term for various modern seats of learning, chiefly applied to (1) Edinburgh, Scotland, in topography greatly resembling ancient Athens and renowned for its university, many schools, literary output, and the culture and good taste of the inhabitants; (2) Boston, Mass., similarly celebrated.

Modern Instance, A, a novel by William Dean Howells, published in 1881. The scene of the story is first laid in a country town in Maine, where Bartley Hubbard, a vain, selfish, unprincipled young man, is editing the local paper. He marries Marcia Gaylord, an inexperienced country girl, and takes her to Boston, where he continues his journalistic career. As time goes on, the incompatibility of the young couple becomes manifest: Marcia's extreme jealousy, and Bartley's selfishness and dissipation, causing much unhappiness and contention. The novel can hardly be agreeable, but it shows that its author has seen very clearly into certain unattractive but characteristic phases of contemporary American life; and the story is told with brilliancy and vigor.

Modern Maccabees, Knights of the, an American fraternal organization founded in 1881. It has 975 branch tents, or lodges, and a total membership of 102,868. During 1902, the organization disbursed \$941,578 in insurance benefits.

Modern Woodmen of America. See WOODMEN OF AMERICA, FRATERNITY OF MODERN.

Modes'to, Cal., city, county-seat of Stanislaus County; on the Tuolumne River, and on the Southern Pacific Railroad; about 80 miles south by east of Sacramento. It is in a productive agricultural region, the system of irrigation contributing greatly to its prosperity. The trade consists chiefly of wool, grain, fruit, and wine. The prominent buildings are the county court-house, county hospital, and churches. Pop. (1890) 2,402; (1900) 2,024.

Modjeska, mōd-jēs'kə, **Helena**, Polish actress: b. Cracow 12 Oct. 1844. Her maiden name was Opido; her father was a musician. In 1860, having married a theatrical manager, Modrzejewski, whose name she has since softened to Modjeska, she began to act, and soon gained local fame. After her husband's death she appeared in Warsaw in 1868, after marrying Count Bozenta Chlapowski in September of that year. In 1876 she came with the latter to America. In July 1877, at San Francisco, she made her American début as Adrienne Lecouvreur in an English version of the play by Scribe and Legouve. Three years later she was seen in London as Camille, and from that time she has been one of the foremost actresses of the English-speaking tragic stage. She starred with Booth in 1889-90. Her best roles are Shakespearian, notably Lady Macbeth, Cleopatra, Ophelia, and Viola.

Modoc (mō'dōk) **Indians**, tribe of Northern California, which in 1872, after firing on the United States forces, retreated to the neighboring lava beds, and there defended themselves desperately till June, 1873, killing or wounding 132 of the troops. Their chief, Captain Jack, and three others, were hanged in October; about 100 who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian Territory. The Modocs originally made their home on the shores of Lost River and Klamath Lake. They called themselves the *Maklaks*, or "the people." They were always a warlike tribe, and when not fighting emigrants and settlers in the early days, were warring with other tribes in their neighborhood. The surviving Modocs now reside at the Klamath Reservation in California.

Modulation, in music, is the act of moving through the sounds in the harmony of any particular key to those of another, or the transition from one key to another. The simplest form is the change from a given key to one nearly related to it, namely, its fifth (dominant), fourth (subdominant), its relative minor, or the relative minor of its fifth. Modulation into the dominant is effected by introducing in any of the parts (rarely in the bass, however) the sharp fourth, which becomes the seventh of the new key; thus, in the key of C, F would be sharpened to effect the transition into the key of G; to pass from that key into that of D it would be necessary to sharpen the C, and so on. In modulating into the subdominant the flat seventh is used, which becomes the fourth of the new key; thus, in passing from the key of C to that of F, the flat B is introduced, and from the key of F to that of B the E is flattened, and so on. The modulation into the relative minor is generally effected by employing the sharp fifth, which becomes the seventh or leading note of the new key; thus in changing from C to A minor the G should be sharpened. As almost every piece ends on the key in which it begins, a second modulation becomes necessary; this is effected by flattening the fifth of the new key if the first modulation is into the dominant, and sharpening the fourth if in the subdominant. When a composer aims at a striking effect he may change from some given key to one quite unrelated, from C to E for instance; but such transitions should be sparingly employed. Modulation is generally resorted to in compositions of some length, for the purpose of catching and pleasing the ear with a fresh succession of chords. See also MUSIC.

Mod'ulus of Elasticity. See ELASTICITY.

Moebius, mē'bē-oos, **August Ferdinand**, German astronomer: b. Schulpforta, Germany, 17 Nov. 1790; d. Leipsic 26 Sept. 1868. He was graduated from the University of Leipsic in 1815, and was for 50 years professor of astronomy there. Through his efforts the observatory was remodeled and by his writings he established a new principle concerning the affinities of figures and proved the close connection between statics and geometry. He published: 'Der Barycentrische Calcul' (1827); 'Lehrbuch der Statik' (1837); 'Die Elemente der Mechanik des Himmels' (1843); etc.

Moeller, mē'l'ēr, **Henry**, **American Roman Catholic** archbishop: b. Cincinnati, Ohio, 11

Dec. 1849. He was graduated from St. Xavier's College, Cincinnati, in 1869; pursued his theological studies in Rome, and upon his return had charge of St. Patrick's Church in Bellefontaine, Ohio, 1876-7, when he became professor at Mount St. Mary's Seminary, Emmitsburg, Md., for a year. He was secretary to Bishop Chatard of Indianapolis, and secretary and chancellor of the archdiocese of Cincinnati. In 1900 he was consecrated bishop of Columbus and in 1903 became archbishop of Cincinnati.

Moeller, Louis, American genre painter: b. New York 5 Aug. 1855. He worked with his father, a decorator, for four years; studied in Munich with Diez and Duveneck; and in 1883 returned to New York. He became a member of the National Academy in 1895, and has exhibited there since 1883. Among his works are: 'Morning News,' 'Puzzled,' 'Short Measure,' 'An Interior,' etc.

Möen, mē'en, Denmark, an island, separated from the southeast of Seeland by a sand-bank and narrow channel; length, 18 miles; greatest breadth, 13 miles; area, including the small islands of Njord and Bogøe, 85 square miles. Its highest point is 460 feet above the sea. It is of Cretaceous formation, and consists of masses of fine white chalk intermixed with flints. The soil is a fertile marly loam; and the high grounds, which are generally well wooded, present a striking appearance from the sea. The largest town is Stege. Pop. (1901) 2,247. Pop. of island (including Njord and Bogøe) (1901) 14,504.

Mœris, mē'ris, Egypt, an ancient artificial lake north of Medinet-el-Fayum, until recent years confounded with Birket-el-Keroon (q.v.)—lake of the horn—with which it was connected. According to Herodotus, Lake Mœris was 350 miles in circumference, and about 300 feet deep. He states it to have been entirely the product of human industry. Birket-el-Keroon, about 30 or 40 miles long and 6 broad, is a natural basin. The works, therefore, which Herodotus attributes to King Mœris (Amenemhat III.) are the Bahr Jusuf (Canal of Joseph), which connected Mœris with the Nile, and the canal connecting with the Birket-el-Keroon, which at the annual inundation of the Nile would make the two lakes appear as one, together with the mounds, dams, and sluices which rendered it subservient to the purposes of irrigation. The fisheries of the lake were very productive. The revenue derived from them went to the Egyptian queens. The colossal statues described by Herodotus as sitting on pyramidal thrones in the centre of the lake are evidently those discovered at Biahmu at the end of the 19th century.

Moero, mwā'rō, or **Mweru**, Central Africa, a lake situated on the boundary of the Kongo Free State and Northern Rhodesia, between lat. 8° 30' and 10° S. traversed from south to north by the Luapula. Its height above sea-level is 2,900 feet; its area about 2,020 square miles; its length 70 miles, and extreme width 24 miles. It was discovered by Livingstone in 1867, and in 1892 the settlement of Rhodesia was established on its eastern shore.

Mœsia, mē'shī-a, a province of the ancient Roman Empire, lying north of Thrace and Macedonia, and south of the Danube, corresponding

to modern Servia and Bulgaria (q.v.). Its original inhabitants were, according to Strabo, a tribe of Thracians. In 227 B.C. a large body of Gaulish invaders entered Mœsia after the death of their leader, Brennus, and settled there under the name of Scordisci. The Romans first invaded it in 75 B.C., penetrating as far as the Danube. It was not, however, until 29 B.C. that it was finally subjugated. The Visigoths (Mœsogoths) settled here in the 4th century, and it was afterward conquered by the Slavonians and Bulgarians.

Moffat, mō'fat, Robert, Scottish missionary to South Africa: b. Ormiston, East Lothian, 21 Dec. 1795; d. Leigh 8 Aug. 1883. He obtained an ordinary education; became a gardener; and about 1813, being deeply moved by the story of some Methodist missionaries, decided to go to Africa, whither he was sent in 1816 by the London Missionary Society. His first work was in Namaqualand, where he made a convert of Afrikaner, a Hottentot robber; later he settled among the Bechuanas in Kuruman, where his wife, daughter of his former employer, who married him in 1819, joined him and helped him greatly. Moffat, with the assistance of several other missionaries, translated parts and finally all of the Bible (1872) into the language of Bechuanaland. He returned to England in 1870, where his wife died in the following year, and spent the last years of his life in rousing interest in South African missions. One of his daughters married Dr. Livingstone (q.v.), the missionary and explorer. Consult: 'The Lives of Robert and Mary Moffat,' by John S. Moffat, their son (1885).

Moffat, William David, American publisher and author: b. Princeton, N. J., 17 Jan. 1865. He was graduated from Princeton University in 1884 and entered the publishing business. In 1897 he became business manager of 'The Book Buyer' and of 'Scribner's Magazine.' He has written: 'The County Penitent'; 'Brad Mattoon'; 'Not Without Honor'; etc.

Mogador, mōg-a-dōr', or **Suirah**, swā'rā, Morocco, a seaport city on the Atlantic Ocean, about 128 miles west by south of the city of Morocco. It is of irregular form, surrounded by walls and fortified by a citadel and batteries. The streets are straight, but narrow; the houses chiefly in the old Spanish style of two or three stories, while some of the mosques are splendid buildings. The Jews, who number about 7,000, reside in a separate quarter, separated by a wall from that of the Moors. The port proper admits only small vessels, larger vessels anchor a short distance off shore. The principal exports are skins, wool, gum, wax, almonds, beans, eggs, olive-oil; imports: sugar, rice, tea, and cotton goods. Pop. about 20,000.

Mogok, mō'gōk, Upper Burma, the capital of the district of Ruby Mines, in a valley 3,900 feet above the sea, 60 miles northeast of Mandalay. It derives its importance from its ruby mines, which are worked by Europeans with a modern electric mining plant. Pop. 7,500.

Mogul, mō-gūl', the same as Mongol, applied particularly to the sovereigns of Mongolian origin, called Great or Grand Moguls, descendants of Tamerlane, who ruled in India from the 16th century.

MOHACS — MOHAMMED

Mohacs, mō'hāch, Hungary, a town in the county of Baranya, on the right bank of the Danube, 25 miles southeast of Fünfkirchen. It is the see of a bishop. It has an active trade at its quay, where considerable quantities of wine, agricultural produce of all kinds, coal, wood, and other articles, are weekly loaded and despatched. Two famous battles were fought in the neighborhood—one in 1526, when Solymán, at the head of 200,000 Turks, defeated and slew Louis II. at the head of 30,000 Christians; and the other in 1687, when the Turks were severely defeated by Charles of Lorraine, and their power in Hungary finally brought to an end. Pop. (1900) 15,832.

Mo'hair, the hair or wool of the Angora goat. The term is more particularly applied to a fabric made of the Angora hair from goats raised in Asia Minor. The name is also generally used, but erroneously, for a wool and cotton fabric made in various colors in imitation of mohair.

Mohair Goat, the Angora goat. See **GOAT**.

Mohammed ("The Praised One"; also written: Mahomet; Muhammad, the Arabic form; Mahmoud; Mehemet; etc.), Prophet and founder of Islamism, generally called by Christians Mohammedanism (but not so called by the followers of the faith of Islam): b. Mecca, Arabia, probably in April 569 A.D. (according to some authorities 570 and 571 A.D.; d. Medina, Arabia, 8 June 632 A.D. Mohammed was not born in the lowly state of life that we might be led to believe by some of the tales of his early life. On the contrary his progenitor, Hashim, of the illustrious tribe of Koreish, was the great benefactor of Mecca and the guardian of the Caaba, which alone vouches for his high position, as this honor was never conferred except upon those belonging to the most honorable tribes and families. Abdul-Muttalib, his son, succeeded to these honors, and the guardianship of the Caaba was confirmed in the line of Hashim by his valiant action in saving the sacred city from the onslaughts of the Christians of Abyssinia. Abdul-Muttalib had many children, and Abdallah was the youngest and most beloved. He was remarkable for personal beauty and possessed the secret of winning the hearts of women. He married Amina, of the tribe of Koreish, and on the night of the wedding, we are told, two hundred maidens died of broken hearts.

Mohammed was the only fruit of this marriage, and his father died two months after, leaving no other inheritance than five camels, a few sheep and a female slave. It is difficult to reconcile this fact with his former exalted position, but we are assured that it is true by the followers of the faith of Islam, as we are also asked to believe the statement that Amina suffered none of the pains of childbirth, and that Mohammed, on the moment of coming into the world, raised his eyes to heaven and exclaimed, "God is great! There is no god but God, and I am his prophet." Legend also tells us that wonderful signs and portents took place at the moment of Mohammed's birth. Lake Sawa dried up, and the sacred fire of Zoroaster which the Magi had kept burning uninterruptedly for over a thousand years, was suddenly extinguished, and all idols fell down. The massive palace of Khosrau, king of Persia, shook to its

foundations and several of its towers were thrown to earth.

When Abdallah died, Amina's grief was so great that it dried up her breasts, and she was forced to look for a nurse among the females of the Bedouin tribes. At length Halima, the wife of a Saädite shepherd took him into the mountains and nursed him, but returned him to his mother at the end of two years because he had epileptic fits. His mother died when he was six years old, and his grandfather, Abdul-Muttalib, adopted him. On Abdul's death, an uncle, Abu Talib, took the lad, brought him up and remained his closest companion and devoted protector throughout his life. His uncle was a merchant and brought Mohammed up in the same line. On one of his trips to Syria, he visited a Nestorian monastery and there imbibed many ideas the results of which show in his subsequent life. Even in his youth he carried religious contemplation to an extreme, and it is believed that his epilepsy had much to do with this morbid tendency in his character. Wonderful mental faculties are ascribed to him from his youth up, but as a matter of fact he was just as illiterate as most of his countrymen. When he was 25 years old he was employed by a rich widow, Kadjah, also of the tribe of Koreish. He displayed such good judgment and business qualities in caring for her caravans and other commercial interests that, in spite of the fact that she was already twice widowed, she married him. She was 15 years older than Mohammed, but bore him two sons and four daughters. Al-Kasim and Abd Allah, the two sons, who were respectively the oldest and the youngest of his children, both died in early youth; the four daughters survived—Fatima, Zainab, Rukaiya and Umm Kulthum. He lived with his wife in faithful and happy wedlock till her death.

With his marriage Mohammed acquired great wealth, and this gave him leisure to indulge the original bias of his mind; his old habits of contemplation were revived and he spent much time in religious speculation. His judgment and probity were widely respected and he seemed to be endowed with many wonderful gifts. There was a steady growth in his zeal to abolish idolatry and other evils, and to substitute a new and purer faith. This was fostered by his intercourse with Jews and Christians whom he was forced to meet in his journeyings. The idea of a new religion finally engrossed his whole mind and influenced his every action. He believed he saw the necessity for it; all sorts of new dogmas were creeping into and rapidly undermining the faith of his forefathers. During the first centuries of the Christian propaganda religious doctrines were more numerous than the stars in the sky; both Christianity and Judaism had crept into Arabia, Zoroastrianism was on the wane, and people refused any longer to accept and conform to the old pagan superstitions. Othman, Zaid and even Waraka, one of his wife's relatives, who had embraced Judaism, were preaching against the futility of star-worship, and their followers were ridiculing fetiches, ceremonies and even the temples. Many were being exhorted to Judaism while others were embracing Christianity, and others still were falling away altogether. Everyone was looking for a religion which should embody the faith of their forefathers with the simple doctrine of the unity

MOHAMMED

of the Deity. This picture presented itself to Mohammed with all its attendant consequences. Something had to be done—the time was ripe, and Mohammed stepped into the breach, launching the faith of Islam. He went back to the beginning of things, and adopted as a hypothesis that God had inculcated in Adam the one and only true religion—the worship of one indivisible and only God, the Creator. He believed that this religion of Adam had been repeatedly debased, and almost forgotten at times, but that a succession of prophets was destined to come into the world to restore it from time to time and bring men's minds back to the original idea—such prophets were Noah, Abraham, Moses and Jesus Christ. These had all fulfilled their respective missions, but man now needed another guide to bring him back to God. It is not to be wondered at that Mohammed looked especially to Abraham, the father of Ishmael, the progenitor of his own race, as one of the greatest of these. With the development of this idea of the oneness of God grew Mohammed's mission as he conceived it. We can scarcely doubt that he was honest in his convictions and in his purpose when he first undertook the reformation of the world, which he really began at the age of 40 years. It is a matter of opinion as to whether he continued to give his efforts in a purely unselfish way during the later periods of his life. It would seem that his original honesty of purpose became lost in his efforts for personal aggrandizement, the ambition to assume the prophetic character, and the possible influence of his hereditary disease, epilepsy. Be this as it may, let us follow out his life and see what he accomplished.

Mohammed's first convert was his wife, Kadijah, to whom he told the particulars of an interview which he claimed to have had in a vision with the angel Gabriel, who declared him to be the apostle of God. He was passing, as was his custom, the month of Ramadan in the cave of Mount Hara after fasting, prayer and meditation, when the angel Gabriel appeared to him, displaying a silken cloth covered with writing. "Read!" said the angel. "I know not how to read!" replied Mohammed. "Read," repeated the angel; and immediately he was illumined with celestial light and understanding, and read what was written upon the cloth, which contained the decrees of God as afterward promulgated in the Koran. Through his wife, her uncle, Waraka, was won back from Christianity and became serviceable to Mohammed on account of his great knowledge of the Old and New Testaments. The next to be converted were the fiery Ali, his nephew, and Zaid his faithful servant; also Abu Bekr, a man of high position, at whose solicitation ten of the best citizens of Mecca joined the faith. Mohammed confided his revelations only to members of his household for a time, and was laughed at by some and reproached by others—Abu Lahab, an uncle, called him a fool, and Abu Talib his adoptive father, while always protecting him, never actually confessed belief in his works. Mohammed personally instructed all his early converts in the doctrines of the new faith of Islam. After four years Mohammed's converts numbered but 40, and they were obliged to hold their meetings in secret in a cave near Mecca. Even here they were discovered and attacked by a rabble. Mohammed had much to contend with in these

early days; many members of his tribe were against him, and Abu Lahib, his uncle, a rich and influential man, openly and rancorously opposed what he called Mohammed's heresy.

In answer to a vision Mohammed now began to preach publicly, and summoned all the Koreishites of the line of Hashim to meet him on the hill of Safa. Scarcely had he begun his discourse when Abu Lahib attempted to hurl a stone at him. Mohammed turned, cursing the hand thus raised against him and predicting his doom, with the further assurance that his wife Onm Jemil would help build his death-fire. Mohammed soon called another meeting and this time boldly announced his divine command to impart his revelations received from heaven. At this meeting he called for a vizier or vicergerent; Ali was selected as he alone volunteered. Although the doctrines of Mohammed were received thus ungraciously by his family and friends, he soon found a following among the people at large. He threw off all reserve and worked assiduously for his cause, proclaiming himself a prophet sent by God to put an end to idolatry. His favorite places of preaching were the sanctified hills of Safa and Kubeis; Mount Hara was his Sinai, whither he retired for contemplation and fresh revelations. He was often attacked with open force by his enemies, and in the 10th year of his prophetic office was deprived by death of his faithful wife Kadijah and Abu Talib. He then retired to the city of Taif but kept gaining numerous followers, among others many inhabitants of Medina. About this time occurred his famous vision in which he claimed to have made a nocturnal journey to heaven on the beast Al Borak, as referred to in the Koran. Shortly after, a conspiracy to murder him was set on foot, and he was obliged to flee to Medina. This took place in 622 A.D., and is known as the Hegira ("flight") and marks the beginning of the Mohammedan era.

Mohammed was accorded a warm reception in Medina and set about promulgating a systematic propaganda of his doctrines. He organized the followers of the faith of Islam, and provided set forms of worship and religious observances; he proselytized the Jews and other sects in the neighborhood and made many concessions to draw them to the new faith. As a result he was made judge and then ruler of Medina, and boldly assumed regal authority and dignity. After marrying Ayesha, the daughter of Abu Bekr, he announced his determination to take up the sword in furtherance of his doctrines. The hope of plunder thus held out brought him hordes of followers. His first expedition attacked a rich Koreishite caravan led by Abu Sofian, and rich booty was secured and divided. But Abu Sofian returned shortly with 3,000 soldiers and utterly routed Mohammed who had but 1,000. Mohammed, badly wounded, managed to escape. He rallied his troops, however, and gained new followers, by seductive promises, explaining that the defeat was due to the sins of his adherents. In 627 Abu Sofian again brought an expedition against him and laid siege to Medina with a force of 10,000 men. After 20 days, however, his forces broke and dispersed on account of internal discord. Mohammed then led his army against the Jews who had sided with the Koreishites, and took a bloody revenge. Over 700 men were massacred, and the women

MOHAMMED

and children were carried into slavery. From this time on Mohammed's thirst for warfare and blood seemed to be insatiable. At the same time his whole nature apparently underwent a change and he began to give way to the most sensuous practices. He introduced a special chapter in the Koran to give himself permission to marry Zainab, the wife of his former slave Zaid. He followed this from time to time with numerous other marriages and amours and multiplied them to such an extent that at the time of his death he had no less than nine wives. All these affairs he explained by his divine mission, although they were diametrically opposed to his own laws as set forth in the Koran. His ambition and his views continued to expand with numerous successes in warfare and the tremendous growth in the number of his now almost worshipping converts. He gradually conquered all the small surrounding tribes of Arabia; and then becoming still more ambitious and arrogant, sent deputations as missionaries beyond the frontiers. He sent to Khosrau Parviz, king of Persia; Heraclius, emperor of Constantinople; Mokawkas, ruler of Egypt; the king of Ethiopia, and the princes of various districts of Arabia, to embrace the new revelation of the divine law made through him. The stronger and more remote principalities rebelled, but the weaker at once adopted the faith of Islam. The king of Persia and Amru, the Ghassanide, rebelled, and Amru had the ambassador from Mohammed executed. This caused the first war between the Moslems and the Christians. The Moslems were beaten with great loss.

Mohammed now saw the importance of regaining the holy city and prepared what afterward came to be known as the "First Pilgrimage." In 629 he appeared before the gates with 1,400 of the faithful. He succeeded in making a peaceful entrance into the city, telling the Koreishites that he was on a mission of peace and wished only to worship in the Caaba. He and his followers were granted three days for this purpose and left on the fourth day, but not without having won over many Koreishites to the new faith, among them being Amru, Othman, and Khaled. Soon after this Mohammed nearly died from the effects of poison administered to him by a Jewess.

He now determined to wrest Mecca from the hands of the Koreishites; in 630, or the 8th year of the Hegira, he marched against the city with 10,000 soldiers. The inhabitants, seeing the futility of attempting any resistance, gave up the holy city into Mohammed's hands, receiving their life and liberty providing they accepted the faith of Islam. The Caaba was refinished, the idols thrown down, but Mohammed wisely refrained from destroying the ancient Black Stone, regenerating it with his own holy touch. Thus the temple became the sanctuary of the faith of Islam. This exercised a wonderful effect all over Arabia and the next year (9 of the Hegira) embassies arrived from all points of the compass to make submission to Mohammed. This is called "The year of Embassies."

In order to intimidate Heraclius, the emperor, Mohammed marched into Syria half way to Damascus, at the head of an army composed of 20,000 foot soldiers and 10,000 horse, but returned to Medina without making an attack. He then extended free worship to the Christians

in consideration of tribute, added a new chapter to the Koran, revoking all regulations in favor of idolaters, and then promulgated his great and last pilgrimage to Mecca, known as the "Valedictory Pilgrimage." This was, perhaps, the most important event of his life. It was toward the close of the 10th year of the Hegira that he started this immense pilgrimage to Mecca, accompanied by a throng which has been variously estimated at from 40,000 to 150,000 persons. He preached to them from Mount Arafat, exhorting the faithful to piety and righteousness, to abstain from sin and to protect the weak. On his return to Medina he shortly fell sick and declined rapidly. He gave instructions that Abu Bekr and Usama, the son of Zaid, should be the leaders of the army, and expired in the arms of his favorite wife Ayesha, 12th day, 3d month, year 11 of the Hegira (8 June 632 A.D.) He was buried in the house of Ayesha where he died. It afterward was annexed to an adjoining mosque which became a place of pilgrimage for generations of Mohammedans.

Mohammed's personal appearance, as far as we are able to judge from Arabic tradition, was neither imposing nor pleasing, but inspiring. He was not above medium height, but was broad-shouldered and deep of chest; he was strongly and compactly built; head, large; brow, high; face, round and ruddy; mouth, large; nose, long and aquiline. His eyes, large, black and fiery, were full of his peculiar magnetic personal power. He wore his black hair long and curly and his beard remained unwhitened at his death. A large birthmark between his shoulders was looked upon as the holy mark of prophecy. His personality was strong and dominant, but his domestic life was as simple as was his frugality at meals. He was kind and generous, a tender father and a loyal friend. Even at the height of his power he lived in a miserable hut, slept upon straw, and his pillow was made of palm leaves covered with leather. His life was withal a strange contradiction, for at times he was deceitful, cunning and cowardly, and in his later years gave way to gross sensuality. His mind in spite of his religion contained a strong admixture of superstition; he believed in omens, charms, and good and bad spirits. Spasmodic convulsions always accompanied his visions or divine revelations, and by many were attributed to his disease of epilepsy. At such times he would perspire profusely and remain in a weakened condition for some time after.

As a political leader and a religious reformer Mohammed undoubtedly ranks among the greatest. Whether he were a real prophet or a charlatan, or a mixture of both, we cannot strip him of the qualities of greatness. His name has survived 12 centuries and his followers to-day number over 175,000,000 living souls. ARTHUR S. WITHERSPOON,
Editorial Staff, 'Encyclopedia Americana.'

Mohammed I., Turkish sultan: b. 1375; d. 1421. He was son of Bajazet I., after whose death (1403) he became prince of Asia Minor and rival of his three brothers for the throne, to which he came in 1413, as the successor of Mousa. During his reign of eight years he strengthened the empire, which was suffering from the recent assaults of Timur (or Tamerlane), pushed its boundaries as far as the Danube, and fostered kindly relations with the Greek empire abroad, and literature, arts, and sciences at home.

Mohammed II., Turkish sultan: b. Adrianople, 1430; d. 1481. He succeeded his father, Murad II., in 1451; two years later undertook the siege of Constantinople, which he carried by storm after 53 days' siege; made the city his capital; made war on the Greek rulers in Morea and Trapezus, on Hunyadi of Hungary, on Scanderbeg, and on Venice, winning for his empire the provinces of Bosnia and Servia, as well as Euboea and Scutari (from Venice) and Kaffa (from Genoa), and for himself the names el-Ghazi, "the Conqueror," and Buyuk, "the Great"; and in 1481 had seized Otranto as a preparatory step to war on Naples when he suddenly died.

Mohammed III., Turkish sultan: b. 1566; d. 1603. He succeeded his father, Murad III., assuming himself the throne by the execution of his 19 brothers. He captured Erlau in Hungary (1596), but was unsuccessful in his further movements in Europe, being attacked in Asia by Abbas the Great, Shah of Persia.

Mohammed IV., Turkish sultan: b. 1642; d. 1701. His father, Ibrahim I., was murdered by the Janizaries, when Mohammed was only seven years old. He came to the throne under the nominal regency of his grandmother, which was soon exchanged for the actual control of the grand-viziers, the Kiuprili. Turkey's foreign policy was aggressive and successful under them; but in 1683 Kara Mustafa was defeated before Vienna. The Holy League, composed of Poland, Russia, Venice, and Leopold I., Roman emperor, then steadily gained victory after victory over the Turkish army, which rose against Mohammed, imprisoned him in 1687, and let him die in chains four years after the accession of his brother, Sulciman II.

Mohammed Ahmed, âh'mêd. See MAHDI, THE.

Mohammed Amir Hasan Khan, â'mêr hâ'sên khân, Indian soldier, legislator, and author: b. India 16 June 1849. He was educated at Benares and Lucknow, served during the Mutiny, and received for his conduct a sword of honor at the great Lucknow durbar. From 1866 to 1900 he was in the legislature of Oudh, and at one time was a member of the legislative council at Calcutta. He published translations from Persian and Arabic into English, and three volumes of original poems.

Moham'medan Architecture. See ARCHITECTURE, Moslem.

Mohammedan Art. Although Mohammedan Art has no existence in the narrower sense of the word, there are nevertheless three aspects in which the subject is important. By the student of religion, Islam's attitude toward art deserves consideration; and the artistic possibility of the Arab mind, and the channels through which the artistic feelings, denied any true outlet, found expression, are of interest to the student of Islamic thought and civilization.

Any tendency toward art in Islam was crushed in the early days of that religion by Mohammed's personal attitude toward painting and sculpture. In the Koran, sura 5, v. 92, are found the following words: "O true believers, surely wine and lots and images . . . are an abomination and the work of Satan; therefore avoid them that ye may prosper." Again in two well-known traditions Mohammed stated that he who made a likeness of a man would, on the Great Day, be asked to furnish a soul for him also; failing in this he would be consigned to hell. He once said, "God sent me against three kinds of men; the proud, the polytheist, and the painter; take care, therefore, not to represent either God or man; but only trees, flowers, and inanimate objects." Such a sweeping prohibition as this well nigh dealt the death-blow to any attempt at expressing the feeling in any form, outside of language. The reverence paid to the utterances of Mohammed may be seen in the pious Moslem's custom of using only plain pieces of ivory in the game of chess; Mohammed's stricture being understood to apply to the images of horse, man, and elephant used in that game. Mohammed's attitude, therefore, toward those things which constitute art, in the narrower sense of the word, was occasioned by his religious scruples against any representation that might serve as an object of worship.

Had it not been for this attitude of early Islam, art might have developed among the Arabs, and later among the adherents of Islam, to a surprising degree. There are many characteristics of the Arab mind, which they impressed on those who adopted their religion, that might have created a unique school of art just as Islam is a unique religion. The Arab, in his native home had little that would help him in establishing any definite lines of form capable of serving as a basic principle in production. There was little to suggest any definite lines of demarkation in the sandy deserts extending as far as the eye could reach. Yet it is due to this fact that in the Arab a lawless, fantastic imagination was cultivated which, had it been directed along proper lines, as it would have been under the influence of the superior culture of those they conquered, might have been prolific of great results. It is probable, also, that in the desert the Arab received his lessons in color, the intensity of which was rendered very high by the clarified atmosphere. In the verdure that did exist in the fertile regions he has been largely influenced by the waving graceful lines of the palm trees, lines which are reproduced in the domes that decorate the mosques.

The Moslem, however, has found many fields in which the artistic principle might express itself, and as decorators they are second to none. In combinations of colors there are always certain principles observed that render the object pleasing to the eye. This holds true of mural ornamentations as well as of the colors intro-

duced into woven goods and glassware. In buildings these colors were combined with gold and marble in rich profusion. Hur, governor of Mosul (106 to 117 A.H.), had a palace of pure white alabaster, the walls of which were inlaid with stones of different colors, set off with beams of carved teak. This palace was known as the *mankusha*, "painted." In more pretentious buildings floors were often paved with marble, each slab of which was separated from the next by bands of gold. Artistic blending of colors and intricacies of designing were found in the woven stuff, for which Oman was especially celebrated. A favorite style was that in which gold thread was run through colored cloth. In Damietta beautiful specimens of this art were common. Silk or half-silk cloth of various colors were woven with arabesques of gold. Other patterns, in defiance of prejudice, consisted of the images of horses, birds, elephants, etc. Sometimes hunting scenes were depicted. Much of this work was done by the Copts.

In the production of glassware Syria early excelled. Glass of many colors was produced profusely ornamented with gold. These soon became articles of luxury; and one native historian mentions a goblet that came from the treasuries of the Fatimides, which sold for 360 dinars. From the same treasuries 18,000 glass vessels were sold. These glasses were either engraved with figures, within and without, or burnt in many colors. The arabesque is a style of ornament carried to a high degree of beauty. One of the main points in this design consists in excluding any representation of natural flowers or vines. Conventional vines and flowers are common, however, and these are set off with inscriptions, or combinations of lines and circles. Color is then added, "distributed with exquisite tact as regards high notes and neutral tints."

Sporadic mention is made of painters, and some few names are saved by the historians Makrizi and Abul Fida; but painting like gilding was almost entirely confined to mural decoration. A story, interesting in that it shows that the Moslem's attitude toward art was not always what it should be may be mentioned here. Two painters, Ibn Aziz and Kosair, agreed each to paint a figure for a certain vizier, one figure to seem to enter the wall on which it was painted, the other to seem to spring from the wall. This they did. Kosair painted a dancer in white garments against a black background; and Ibn Aziz painted his dancer in red on a yellow background. As each painter substantiated his claims the vizier rewarded them richly.

The Arabic alphabet was a field upon which the artistic ingenuity of the Moslem was expended with good results. The older Cufic characters were soon supplanted by more graceful, flowing letters with many ligatures and rich voluptuous lines. These characters easily lent themselves to intricate systems of interweaving with which the walls of mosques might be decorated. Verses of the Koran were used for this purpose, and were reproduced in letters of gold, on white marble. Sometimes glass of highest finish was used for these inscriptions. They were generally white and blue. One artist, whose skill in the formation of such inscriptions was well known, lived in the time of Walid I. He is the artist who wrote the gold inscription in the Prophet's Mosque at Medina, an inscrip-

tion which consists of several short suras of the Koran. Houses also were decorated with these inscriptions from the Koran or the Poets. Many doors are ornamented in Egypt with inscriptions set off by colors, though this is a superstition in this case.

It was in Spain, however, among the Moors, that art reached its highest development. Here painting and sculpture were cultivated and were used extensively for decorating palaces and houses. The civilization attained by the Moors when the rest of Europe was sunk in ignorance has been a theme on which historians have dwelt at length. Artistic handiwork of all kinds was excelled in; even keys were exquisitely decorated. "Potters had attained to the art of producing a ware shining with iridescent gold or copper lustre." In the great mosque of Cordova there was a pulpit "constructed of ivory and choice wood, in 36,000 separate panels, most of which were encrusted with precious stones and fastened with gold nails." There were also numerous works of sculpture and paintings found in az-Zahra. The sculptured lions and paintings of Alhambra, still to be seen, show to what extent the arts progressed among the Arabs of Spain.

Mohammedan Literature. See ARABIA, Literature.

Mohammedanism is the term frequently given to the religion taught by Mohammed; but it is not used by the followers of that religion. Abu-Bekr, the first caliph, is reported to have said that it is not Mohammed, but the God of Mohammed, that we worship. The term by which the religion is known, wherever professed, is Islam, "submission to the will of God." Those who embrace Islam are called Muslim (frequently written Moslem), a participle of the same stem from which the verbal noun Islam is derived. Still another term, used as the equivalent for Moslem, is Mumin, "believer." It, likewise, is a participle, formed from the stem that gives rise to the word Imān, "faith."

Islam is the religion professed by Turkey, Syria, Palestine, Arabia, Persia, Asia Minor, Afghanistan, Baluchistan, Turkestan, and the Malay Peninsula. India has more than 57,000,000 Moslems. China has about 25,000,000. Owing to the great difficulty of securing exact figures from many of the places where Islam is supreme, an accurate statement as to the number of its adherents is impossible. It is generally estimated at 175,000,000.

Islam is divided by the theologians into two heads: Imān, "faith," and Din, "practice." The separate articles of both heads are determined by the Koran, the Traditions or sayings of Mohammed, and the decisions of the learned officials. Under Imān are given six cardinal points of belief, as follows: belief in God and his unity; belief in angels, and good and bad spirits; belief in the Koran and revelation; belief in the Prophet; belief in the resurrection and the judgment day; belief in God's absolute rule of the world, "There is no god but Allah, and Mohammed is his envoy."

The latter part of this statement will be treated of in its proper place; here it is Islam's conception of the deity that must

MOHAMMEDANISM

be set forth. He is above all omnipotent. No phrase occurs more frequently than this: "and he is powerful over all things." He is omniscient; "And he knoweth all things." This is a phrase equally often met in the Koran. "With him are the keys of the secret things; none knoweth them besides himself: he knoweth that which is on the dry land and in the sea; there falleth no leaf but he knoweth it; neither is there a single grain in the dark parts of the earth, neither a green thing nor a dry thing but it is written in the perspicuous book." (Sura 6, 59.) "He is the ever-living, eternal God." "God! there is no God but he; the living, the self-subsisting; neither slumber nor sleep seizeth him; to him belongeth whatsoever is in heaven or on earth." (Ibid.) He is, moreover, the creator of all things. "His is the kingdom of heaven and earth; he giveth life and he putteth to death; and he is almighty. He is the first and the last; the manifest and the hidden; and he knoweth all things. It is he who created the heavens and the earth in six days, and then ascended his throne." (Sura 57, v. 2.) His word alone creates, "When he decreeth a thing, he only saith unto it, 'Be, and it is.'" (Sura 3, v. 4), cf. (Sura 11, v. 9). As a creator he works not as man works. "We created the heavens and the earth and whatever is between them, in six days, and no weariness affected us." (Sura 50, v. 37.) Mohammed's account of creation, founded on the Old Testament account, is rather confused, especially his ideas as to what acts of creation were performed on the separate days. His assertion "no weariness affected us" (God is the speaker, of course) is a refutation of the Jewish idea, as he understood it, that God needed a rest day.

He is not only creator of all things, but ruler of all things, and protector as well. "It is he who causeth you to sleep by night, and knoweth what ye merit by day; he also awaketh you therein, that the prefixed term of your lives may be fulfilled. . . . He is supreme over his servants, and sendeth his guardian angels to watch over you, until, when death overtaketh one of you, our messengers cause him to die; and they will not neglect our commands. . . . Say, who delivereth you from the darkness of the land, and of the sea, when ye call upon him humbly and in private, saying 'verily, if thou deliver us from these dangers, we will surely be thankful.' Say, God delivereth you from them and from every grief of mind." (Sura 6 v.) His care is always assured to those who follow his way. "Say, my Lord hath commanded me to observe justice; therefore set your face to pray at every place of worship, and call upon him, approving unto him the sincerity of your religion. . . . A part of mankind hath he directed." (Sura 7, 28.) "Whoever therefore shall deny Tagut and believe in God, he shall surely take hold on a strong handle, which shall not be broken; God is he who heareth and seeth. God is the patron of those who believe; he shall lead them out of darkness into light." (Sura 2, v. 257.)

Though he is the ruler of all things and may do as seemeth good in his sight, yet is he a just God, and punishes only where punishment is due. "We will appoint just balances for the day of resurrection: neither shall any soul be injured at all; although the merit or guilt of an action be of the weight of a grain of mustard

seed only, we will produce it publicly; and there will be sufficient accountants with us." (Sura 21, v. 48.) Those who suffer have gone astray or are being prepared for better things. "Every soul shall taste of death; and we will prove you with evil and with good, for a trial of you." (Sura 21, v. 36.) Of those sorely tried it is said: "I have this day rewarded them, for that they suffered the injuries ye offered them, with patience; verily they enjoy great felicity." (Sura 23, 113.) As he is a just God, every creature is responsible to him, and must answer for his choice of good or bad, "Did ye think that we had created you in sport, and that ye should not be brought again before us? . . . who-ever, together with the true God, shall invoke another god, concerning whom he hath no demonstrative proof, shall surely be brought to an account for the same before his Lord." (Ibid, v. 117.)

Though God is just, he is also merciful. "We do not lay upon any soul more than it can bear." (Sura 6, v. 153.) Like the God of the Hebrews he puts off the evil day in the hope that man may repent. "If God should punish men for their iniquity, he would not leave on the earth any moving thing: but he giveth them respite unto an appointed time." (Sura 16, v. 163.) The reconciliation, however, of mercy and justice was a problem that never occurred to Mohammed.

Another problem that Mohammed, very wisely, never considered is that of freedom of choice and God's absolute decree. Though the latter is a separate article (the sixth) of Imân, a brief statement of it will be given here. Everything that has happened or that will happen, has been already fixed by God. "Say, nothing shall befall us, but what God has decreed for us." (Sura 9, v. 51.) "No soul can die unless by the permission of God, according to what is written in the book containing the determination of things." (Sura 3, v. 141.) "He hath formed his creatures; and . . . determined them to various ends, and directed them to attain the same." (Sura 87, v. 2.) These and other passages in the Koran show that Mohammed was a firm believer in God's absolute decree of all things. He was no theologian, however, so there arose no question about this decree and man's free will. His attitude to the question may be shown by a quotation from sura 4, v. 80. "If good befall them they say it is from God; but if evil befall them, they say; this is from thee, O Mohammed: Say, all is from God; but what aileth these people that they are so far from understanding what is said unto them? Whatever good befall thee, O man, it is from God; and whatever evil befall thee, it is from thyself." He, as a religious man, could get no further than this contradiction, and he adjured his followers never to dispute over these points.

It is impossible to discuss here all the attributes and activities of God as they are given in his 99 names; but there is one more aspect of the Moslem's belief in God that must not be neglected. It is the most important attribute of the deity, and its statement is found in sura 112. "Say, God is one God; the eternal God; he begetteth not, neither is he begotten; and there is not anyone like unto him." In sura 19, v. 91, we read: "They say, the Merciful has begotten issue. Now have ye

MOHAMMEDANISM

uttered an impious thing." These quotations show the Moslem's attitude toward Christianity. In Islam there is no Trinity; there is no Fatherhood; God has taken to himself no son; but is alone in his glory and power. Christ, to the Moslem, is a prophet. He was the word of God "conveyed into Mary." Islam, failing utterly to grasp the significance of Christ's life, could not accept the idea of his crucifixion. They have therefore found an end that they deem more worthy of a prophet, and in the Koran we read that one in the likeness of Christ was crucified.

Joined to the statement of the first great truth of Islam, "There is no god but God," is another statement considered by Moslems to be just as important; "and Mohammed is the envoy of God." Concerning his divine mission, Islam knows no doubt. He was the last and the greatest of all the prophets—"The seal of the Prophets." Of prophets, thousands are recognized by Islam; but there are six, only, deemed great enough to be the holder of a title; they are: Adam, Noah, Abraham, Moses, Jesus, and Mohammed. As a prophet, Mohammed announced himself to the world when he first recited the 96th sura: "Read in the name of thy Lord who hath created all things." He never claimed to be more than the envoy or prophet of God, and as such only is he revered by the intelligent Moslem. His tomb at Medina is an object of veneration to the Moslem world and should be visited by every pilgrim. His intercession may be asked in prayer; for he was the friend of God. Five times every day Islam testifies to its faith in God and its veneration for the prophet. Every Moslem must believe in revelation, "that which is sent down." (Sura 2, v. 3.) Beginning from earliest times, there have been numerous revelations, each of which was a law for mankind, till superseded by the next. So each of the six prophets mentioned was the recipient of a revelation. Mohammed's revelation, the Koran, is the only one not to be abrogated. It is distinctly the Word of God as revealed to Mohammed, and is on a higher plane than the Traditions, or inspired sayings of the prophet. It was inscribed on tablets in heaven from eternity. From time to time portions of it were given to Mohammed by the angel Gabriel.

The Moslem must believe, furthermore, in angels, of whom there are great numbers. They were created long before the world was, and are of a finer material. Every believer has two recording angels; one for his good, the other for his bad deeds. The angels are charged with intercession for mankind. Certain angels preside over hell. Two important angels are Munkar and Nakir; in these every Moslem believes most firmly. There are four arch-angels: Gabriel, the angel of Revelation; Michael, the patron of the Israelites; Izrafel, who, on the last day, will blow the trumpet, and Azrael, the angel of death. Besides these angels there are the *ginn*, good and bad spirits, in whom Mohammed believed. Sura 72 states that a band of them once passed Mohammed and paused to listen to him. What they heard caused them to exclaim: "verily, we have heard a marvelous discourse." Some of them are believers in Islam and perform all the duties that devolve upon the true believer. They may assume various forms, and are so numerous

that the pious Moslem, in performing the most trivial act, such as building a fire, is apt to exclaim "with your permission, ye blessed." By many it is believed that all *ginn* are to be destroyed on the last day; others believe there is to be a special place, outside of paradise, where such as have been believers may dwell.

In the immortality of the soul, resurrection, judgment, paradise, and hell, the Moslem believes most firmly. During the first night after death, the soul remains with the body, so that it may be questioned by the two angels Munkar and Nakir. It is a question as to whether the Koran refers to this belief or not; but nevertheless it is fixed in Islam. When the angels have finished their examination, they depart, leaving the believer in peace; the wicked in torment. This is the Moslem Hades. In sura 23, v. 99, speaking of unbelievers who have died, it is said: "behind them shall be a bar until the day of resurrection." The word translated by Sale "bar" is the Arabic *barsach*, and is explained by the native commentators as a partition between the living and the day of judgment, or as an intervening state between death and judgment. Generally speaking, it denotes the state of the departed soul, and must be entered by all. When the trumpet is blown on the last day all must appear. Mention of this day is very often made in the Koran, especially in the earlier suras. It is the one subject of suras 75, 81, 82, 83 and 84. On this day all actions shall be weighed. "Those whose balances shall be heavy with good works shall be happy; but those whose balances shall be light are those who shall lose their souls and shall remain in hell forever." (Sura 23, v. 104.) This great day, the coming of which is known to God alone, is to be ushered in by certain signs, divided into the "lesser" and the "greater." Of the former there are eight, such as decay of faith, turmoils, wars, etc.; of the latter there are 16, the sun will rise in the west; the Antichrist will appear; Jesus is to come to earth, embrace Islam and slay the Antichrist. The last trial of this day is to be the crossing of the bridge Sirat, which is finer than a hair and sharper than a sword. Still, the believer shall cross in safety while the wicked fall to the gulf below. Should any who have professed Islam, yet lived wicked lives, be consigned to hell, they are not to remain there forever; but will be gradually purified and released. To the Moslem, hell is for the followers of other religions.

In paradise the Moslem is to enjoy all those things which to the mind of the desert Arab seemed most desirable. Here are gardens, trees ever green, rivers ever flowing, beautiful maidens, appetites that, so far from being satiated, increase as the delights are enjoyed. Here, too, he shall always see the face of (his) God and praise him, to whose mercy he owes his bliss; for his works alone are not enough to assure him entrance.

Islam is not, however, a religion of faith only; for there are certain institutions, constituting Din, or religious practice, the performance of which is obligatory. Prayer, almsgiving, fasting, and the pilgrimage, are duties that tax the Moslem to no small degree. Prayers are to be made to God five times every day, and are to be made with the utmost decorum. Preparatory to these prayers there are certain ceremonies of purification, consisting of ablution, either partial or covering the entire body;

MOHAMMEDANISM

for the idea of an unclean person in the presence of God is intolerable to the Moslem. To facilitate these ablutions, every mosque is provided with a tank, whence issue many small streams of water. Should the worshipper be praying where there is no water, he may use sand or dust. As he ends this ceremony he is to testify that "There is no god but Allah, and Mohammed is his envoy," following this by reciting sura 97. Should the worshipper be conscious that he is clean, he may omit the ceremony. He then assumes a certain position, facing Mecca, and states softly that he intends to perform so many inclinations, following this by reciting the first sura. After this other expressions of praise are used. Though prayer is frequently mentioned in the Koran, the five periods at which it is enjoined are nowhere mentioned together. These periods are morning, noon, afternoon, sunset, and night. The approach of these hours is heralded by the muezzin, who, ascending the minaret of the mosque, cries out: "Allah is most great (four times); I testify that there is no god but Allah (twice); I testify that Mohammed is the envoy of Allah (twice); come to prayer (twice); come to security (twice); Allah is most great (twice); there is no god but Allah." Prayers may be said wherever the believer happens to be at the time; but on Friday they should be said at the mosque, where a sermon is also delivered.

Almsgiving is a very important duty in Islam and grew doubtlessly out of the natural hospitality of the Arabs. The Koran makes frequent mention of it, enjoining it in most emphatic terms. "O true believers, bestow alms of the good things which ye have gained, and of that which we have produced for you out of the earth, and choose not the bad thereof to give it in alms, such as ye would not accept yourself." (Sura 2, v. 269.) "If ye make your alms to appear, it is well; but if ye conceal them and give them unto the poor, this will be better for you, and will atone for your sins." (Ibid. 272.) How Mohammed considered alms may be seen from several passages of the Traditions, as quoted by Hughes. "Your smiling in your brother's face is alms; assisting the blind is alms." The Koran distinguishes between legal and voluntary alms; but this distinction has been done away with to a great extent. The necessity of giving, however, remains and alms are given regularly by those who neglect many of the other duties. In the early days of Islam legal alms were collected by officials appointed for that purpose; but their bestowal now is left to the individual conscience.

Fasting was considered of great importance by Mohammed, as thereby atonement might be made, and at the present day many who neglect their daily prayers perform all the duties of the fast. The month of Ramadan was chosen for the great fast, because in it revelation came to Mohammed. Throughout this month, during the entire day, drinking, eating, smoking, and many other indulgences are forbidden. When night comes, however, restrictions are removed till the next day. This fast is very severe when it falls in summer (the year being lunar, each month passes through all the seasons) and many exemptions are provided for those unable to undertake its arduous duties. Other fasts, meritorious, but not obligatory, are also in favor with Moslems. The object of these fasts is not alto-

gether concerned with the mortification of the body; the heart is to fast; it must abstain from worldly matters and commune with God.

Once at least in his life-time the Moslem must make the pilgrimage to Mecca. "We appointed the holy house of Mecca to be a place of resort for mankind, and a place of security; and said, Take the station of Abraham for a place of prayer; and we covenanted with Abraham and Ismael, that they should cleanse my house for those who should compass it, . . . and those who should bow down and worship there." (Sura 2, v. 119.) "And it is a duty toward God, incumbent on those who are able to go thither, to visit this house." (Sura 3, v. 97.) Some further regulations are found in sura 2, v. 194, and in sura 22. Trade may be indulged in while on the pilgrimage, and sura 5, v. 2, gives direction for women who contemplate the performance of this duty. When the pilgrim nears Mecca he bathes and puts on the Ihram, pilgrim's robe, and advances to the city. Here there are certain ablutions to be performed before kissing the Black Stone. He must then encircle the Caaba, the temple, seven times; kissing the Black Stone each time. After other prayers and ceremonies he must run between Mount Al-Safa and Mount Al-Marwa seven times, with stated prayers. Later he must visit the Valley of Mina and Mount Arafat where more prayers are performed. On the 10th day he proceeds to Mina and casts stones at three pillars which are set up there, seven stones at each. After this very ancient custom there is a sacrifice which ends the pilgrimage. The pilgrim may then be shaved and resume his usual clothing. He should, however, visit Medina and do homage at the tomb of Mohammed.

Though not reckoned as one of the pillars of Islam, still the obligation to wage holy wars has been so firmly held that it deserves mention here. In early days every Moslem looked forward to a world-wide conquest, and by means of these holy wars expected to bring all countries under the banners of Islam. To a conquered country the terms were: Embrace Islam, pay tribute, or die. These were harsh terms, but much of their severity is accounted for by the early history of Islam. Broken oaths of allegiance and unprovoked attacks are responsible, to a large extent, for Mohammed's uncompromising attitude. The Koran does state itself clearly on this point, yet no precept found there, when "taken with its context, can justify unprovoked war." At the present day a far more liberal policy is preached toward unbelievers, and the subject is much debated by the learned in Islam. It may be said that the day of these wars "is rapidly passing away, if, indeed, it be not already passed."

Among the prohibitions of the Koran, the most important are those concerning wine and gambling. "They will ask thee concerning wine and lots; answer in both there is great sin and also some things of use unto men; but their sinfulness is greater than their use," and suras 2, v. 216; 5, v. 92, treat of the same. These verses are held by the Moslem to be an absolute prohibition. There might be, however, some doubt as to that if the verses alone, and not their traditional interpretation, were considered. Another prohibition of the Koran is murder. When one believer kills another intentionally he is to remain

MOHAMMEDANISM

in hell forever. (Sura 4, v. 96.) From this fate, however, popular belief rescues him. Should the killing be by accident, there are certain expiations that may be made. There are also many prohibitions in regard to eating, the most important of which is that in regard to swine-flesh. (Sura 5, v. 4.) Such flesh as is eaten must be from an animal killed in a prescribed manner. Laws of marriage, divorce, testaments, and many other civil and criminal laws are founded on the Koran and the Traditions. Mohammed founded not only a religion but a social system as well, wherein the religious and the political life are inseparable. This is the unique feature of Islam.

Mohammed is said to have told his followers that after him 73 sects would arise. His prophecy has been more than fulfilled. It is impossible to give more than a synopsis of a few of the more important divisions of Islam. The two great divisions of sectarian Islam are the Sunnites and the Shiites. Compared with the Sunnite, the Shiite is a small sect, numbering about 15,000,000, while the former has about 145,000,000 adherents. The Shiites believe Ali to have been the legitimate Caliph or Imam, that is, successor of Mohammed, and consequently reject Abu-Bekr, Omar and Othman. Ali, by his double relationship with the Prophet—he was cousin and son-in-law,—as well as by reasons deduced from the Koran, and by traditions assigning him the appointment at the hands of Mohammed himself, should have been Imam. When Omar died, Ali was offered the succession, but as he could not satisfy his opponents that he would rule in accord with their wish he did not receive it till the death of Othman. Ali, however, was soon murdered and his son Hasan abdicated in favor of Muawiyah on condition that he might resume his office at Muawiyah's death. Yazid, however, cheated Hasan of his rights and here starts the Shiite schism. They profess allegiance to a line of 12 Imams, beginning with Ali and ending with Al Mahdi, who disappeared, but is to return. In the meantime they receive religious and legal decisions from a class of learned men, called Mudgtahids, a class of authorities not recognized by the Sunnites except in the case of the founders of the four orthodox Sunnite schools. There are numerous subdivisions of the Shiites, but on certain points they agree. Most of them agree in believing the Imams to be of divine nature; the result probably of a tradition credited to the Prophet, wherein he stated that he and Ali were pre-existent, before even the world was formed. The Shiites also observe the ceremonies of Moharram in commemoration of Hasan and Hosein, who were sons of Ali and were both murdered. Their memories are sacred to the Shiites. They differ from the Sunnites in that they credit the first worshippers with the possession of an inspired book or revelation. In the ritual and civil laws also many differences are found. They have a large collection of traditions, a fact often ignored by scholars, misled by the Sunnites' claim to be the Traditionists *par excellence*.

The Sunnites acknowledge the first four caliphs to have been the rightful successors of Mohammed. They are divided into four orthodox sects or legal schools, the first of which was founded by Abu Hanifa. This Abu

Hanifa was a pupil of the sixth Imam of the Shiites; but separated from him to form the school of his name that now predominates in Turkey, Central Asia, and northern India. The second of these schools, that of Ash Shafia, prevails in southern India and Egypt. The third school, that of Malik, has its home in Morocco and Barbary. The last school, that of Ahmed ibn-Hanbal, is found in East Arabia and portions of Africa. The term *Sunni*, which they apply to themselves, is an arrogant title. It signifies "one who is on the path." They claim that they receive the six authentic books of tradition. The main points wherein they differ from the Shiites have already been touched upon; the great body of ritualistic differences must be passed over.

From the school of Ahmed ibn-Hanbal sprang the sect of the Wahhabites, who are named after their founder's father, the founder himself being named Mohammed. This Mohammed, born in Arabia, in the early part of the 18th century, having seen, in the course of his travels, that Islam had departed from its primitive faith, was filled with determination to restore to the religion of Mohammed its early purity. His zeal as a reformer received some temporary setback and he soon became the warrior-prophet. Many converts were made by his missionaries, and the movement grew till Turkey feared for her own safety. In 1803 Mecca, and a year later Medina, was captured. The political power of the Wahhabites was soon destroyed, however, though the principles are still a force in Islam. In India, too, the movement met with a similar fate.

The tenets of the Wahhabites are, practically, those held by the early Moslem. They arrogated to themselves the name of Unitarians, stigmatizing other Moslems as polytheists, inasmuch as the doctrine of the eternity of the Koran meant two eternal beings, therefore two gods. The reverence paid to saints and their tombs aroused to a high degree the antagonism of the Wahhabites. Even the tomb of Mohammed receives no reverence from them, and when they captured Medina, all the rich ornaments were stripped from this sacred spot.

Early in the history of Islam there arose a set of free-thinkers, whose theories are held at the present day. They are known as the Mutazalites and were founded by a Persian, Wasil ibn-Ata, who separated from the school of Hasan al-Basri. The Mutazalites hold that man is the governing factor in his own acts, and is perfectly free to choose; predestination being thus abolished from their tenets. They deny the eternity of the Koran, as well as the attributes of God, believing that each attribute would be a separate, eternal quality, and that, therefore, the unity of God would be destroyed.

Mokanna, "the veiled," is an interesting figure in the history of Islam, owing to his appearance in Moore's 'Lalla Rookh.' This fanatic proclaimed himself God incarnate, and taught that religion consisted in faith, not works. He sent out many missionaries and quite a force collected under his banners. At the advent, however, of the caliph's forces, which were sent to crush him, he deserted his followers and finally committed suicide to escape capture. Persian and Indian sources are responsible for many of his doctrines. He had

MOHAVE DESERT—MOHAVE INDIANS

secret followers for many centuries after his death.

Hasan ibn-Sabah, founder of the order of the Assassins, is a figure well known in history, owing to his connection with the Crusaders. He was at first an adherent of another sect and taught the doctrines of that sect throughout Arabia and Persia; but having won the confidence of a powerful prince, he gained possession of a fortress in Persia. Here he constituted himself grand-master of an order with a large number of minor officials, repudiated many of the tenets of the sect to which he belonged, and began to preach religious devotion and political assassinations. His followers were many throughout Syria and Persia, and he soon announced himself as al-Mahdi, repudiated the Koran, and with it all moral laws. Under the title "Old Man of the Mountain," he became a terror not only to the Crusader, but to the Turk as well. They were finally overthrown. "Of these sects there are still scattered remnants in Syria and India, and as late as 1866 an English judge at Bombay had to decide a case of disputed succession according to the law of the Assassins."

There is a sect of Mystics in Islam known as the Sufis. They are Moslem in name only, for they deny the necessity of religion, though they admit that its practice is useful as a guide. Their chief doctrine is entirely pantheistic. God is all and is in all, consequently there is no good, no evil, only God. The only occupation of the Sufi is meditation, constant meditation; for by this he is made ready to return to God when his soul is released from captivity. They are divided into numerous sects, some of them believing themselves simply inspired of God, others believing themselves unified with God. Their belief, they claim, has always been professed. It obtained its chief hold in Persia, where it has stirred up much trouble. Though banished in 1707, "the whole country has been so undermined by this insidious heresy that it can almost be said that Persia, throughout its whole extent, contains no real Moslem."

A few words may be added in regard to Islam's hope of a Messiah, Al-Mahdi, "the guided one." He is to come to restore the glory and power of Islam, and has been foretold by Mohammed, in many traditions. According to the Sunnites, he is still to come; but the Shiites believe he has already appeared in the person of the twelfth Imam, who having disappeared for a time, is to return. Many have taken advantage of Islam's hope and have announced themselves as the promised Mahdi. The one, to whom at present the eyes of the world are turned, is the head of the brotherhood of as-Sanusi, founded by Mohammed ibn-Ali, as Sanusi, in 1837. This brotherhood advocates reforms of the most sweeping character. The exact letter of the Koran is to be followed in all matters. It is, generally speaking, closely related to the Wahabi movement, yet stricter. The present head, who claims to be the Mahdi, has established himself in the Sahara, and from here he sends out his missionaries. He is collecting arms and quietly making preparations for a holy war that is to transform Islam. "Sooner or later Europe—in the first instance England in Egypt and France in Algeria—will have to face the bursting of this storm. For this Mahdi is different from him of Khartum and the southern

Sudan, in that he knows how to rule and wait. . . . It will then be for the Ottoman sultan of the time to show what he and his caliphate are worth. He will have to decide whether he will throw in his lot with a Mahdi of the old Islam and the dream of a Moslem millennium, or boldly turn to new things and carry the successorship and the people of Mohammed to join the civilized world."

In bringing this article to a close, mention must be made of Babism, of which Behaism is the latest development. In the year 1844, Ali Mohammed, in Persia, announced himself as the Bab, or "gate," that is, "the source through which revelation comes." As the inaugurator of a new dispensation, he set about the reformation of men's lives. Many converts were made and the antagonism of their Moslem neighbors was aroused. Thousands of adherents to the new faith were slain, and in 1850 the Bab himself met this fate. As persecution continued many fled from Persia and finally settled at Akka. In this band of exiles was one upon whom the Bab had conferred the title of Beha Allah, that is, "the Glory of God." His declaration that he was the manifestation foretold by the Bab was accepted, and his followers have been styled Beha'is. At his death in 1892, his son, Abbas Effendi, succeeded him and is considered as the third of the divine messengers. The thousands of converts made by this new movement attest its importance. Its missionaries have made converts by thousands. Here, in the United States, its adherents are scattered throughout the larger cities, and Professor Browne, the eminent English authority on Babism, speaking of its influence, states that "the number and influence of the Babis in Persia is immensely greater than it was 15 years ago, and the conviction which I heard continually expressed this year in Babi circles in Cairo, that in the course of a very short time their religion would reign paramount in their own country, . . . is seriously discussed by European diplomats and consular officers."

GEORGE W. OSBORN,
*Acting Professor of the Semitic Languages,
New York University.*

Mohave (mō-hā'vā) Desert, California, an arid basin chiefly in San Bernardino County, in the southeast, and also extending into Arizona, and forming part of the great Colorado Desert. The Mohave River rising in the San Bernardino Mountains flows through it for some distance, until it disappears in the Mohave Sink.

Mohave Indians, an American tribe of the Yuma family, residing in Arizona and California

MOHAWK—MOHILEV

in the region of the Colorado River. There are upward of 2,000 Mohaves remaining, 600 of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically, and are expert makers of pottery and baskets. They practise tattooing and cremate their dead. See YUMA.

Mohawk, a river whose head-waters are in the southern part of Lewis County in New York, which flows south to Rome, then east by south, with many curves, to the Hudson River, which it enters at Cohoes. It is about 150 miles long, and is the largest tributary of the Hudson. In several places along the route there are rapids and falls, as at Little Falls in Herkimer County, Oriskany in Oneida County, and several other places, all of which are noted for manufacturing. The bed of this stream was once much wider than the present channel through which the water passes; in some places the distances between the old banks are from a mile to nearly three miles. The Mohawk Valley is noted for its beauty and the fertility of its soil. The Erie Canal (q.v.) is parallel with the river to Rome. A number of pretty villages and thriving manufacturing towns are on its banks, chief of which from west to east are Rome and Utica in Oneida County; Ilion, Herkimer, and Little Falls in Herkimer County; Fort Plain, Canajoharie, Fonda, and Amsterdam in Montgomery County; Schenectady in Schenectady County, and Mechanicsville in Saratoga County. In the "Settlement Period" of the United States, this valley was the main highway from the "East Colonies" to the Great Lakes. It was the home of the most warlike tribes of Indians, the headquarters of the Five Nations.

The first missionaries and the first explorers who left the Hudson River in this part of the United States, journeyed along the country through which flowed the Mohawk.

In this valley, near the Mohawk, Goupil was killed by the Indians, and later Father Jolques (q.v.) was martyred at the place now called Auriesville, on the south side of the river a little east of Fonda. Sir William Johnson built two homes in this valley, one at Fort Johnson about one mile west of Amsterdam, now the railroad station of Akin, the other, Johnson Hall, near the present Johnstown in Fulton County. Much of the early history of the river and valley as related to the whites is connected with the rule of Sir William Johnson and his power over the Five Nations. The centre of wealth and power, in the valley before the war, was at Johnson's home. At the breaking out of the Revolutionary War, an effort was made by both parties to hold possession of the Mohawk. The death of Sir William Johnson, just at the beginning of the War, removed a strong power from the council. His sons and their friends lacked his humanity and wisdom. The union between the British and the Indians resulted in many terrible scenes, among others the massacres of Cherry Creek and Schoharie, the burning of homes, and the taking of many lives in the valley. Burgoyne (q.v.) realized the value of having possession of this valley, and some of the important battles of the Revolution took place along the Mohawk. There were many Tories in the valley; but a large number of the settlers were

always patriots. When the news of Concord and Lexington reached the inhabitants along the Mohawk, many of them loaded into wagons all the grain they could spare and sent the precious cargoes over the rough roads to Boston. When the British determined to end the war the Mohawk Valley, the gateway to the West, was the site chosen. Here the Tories outnumbered the patriots, and the Indians were the allies of the British; but St. Leger's defeat at Oriskany by men under Nicholas Herkimer, filled Burgoyne with despair and fired the enthusiasm and enlivened the hope of the patriots.

Two railroads parallel the river to Rome, the New York Central and Hudson River and the West Shore. The manufacturing industries of the valley which depend largely for motive power upon the water-power of the Mohawk, are extensive and increasing.

Mohawks, a tribe of North American Indians, one of the Six Nations, named collectively by the French the Iroquois. According to their own tradition, confirmed by those of other tribes, they were the eldest people in the confederacy of the Six Nations. They believed that they were liberated from subterranean confinement by Tareya-wagon, who guided them into the valley of the Mohawk; thence they passed to the Hudson and to the sea; but the valley in which they at first established themselves was the seat of their power from the discovery of the country until the American Revolution. Their dominion extended from Lake Champlain to the head-waters of the Susquehanna and the Delaware. Renowned above all the other nations for their skill as warriors, they carried terror wherever they went. Their forays were pursued as far as the Connecticut River, and their influence prevailed among the small independent tribes about the region of the present city of New York. During the French and Indian war they supported Sir William Johnson, following him in his most perilous expeditions, and aiding him in the contests of Lake George and Niagara. After his death they transferred their attachment to his family, and were forced to flee from their ancestral home to Canada, where lands were assigned them on the Grand River. See IROQUOIS; SIX NATIONS.

Mohegan, mō-hē'gan, or **Monhegan** (mōn-hē'gan) Indians, a tribe of North American Indians of the Algonquian family, who formerly lived on the Thames River in Eastern Connecticut. They were at one time united with the Pequots and after the death of Sassacus, the Pequot leader, the remainder of the tribe came to the camp of the Mohegan chief. After the death of King Philip in 1676, the Mohegan tribe was the only important one in that region. They became scattered, some joining the Brotherton Indians in New York. The survivors of this race are so mixed with negro and white blood that they have practically lost their identity.

Mohilev, mō-hē-lēf', Russia, a western town and government. The town and capital of the government is on both banks of the Dnieper, 85 miles southwest of Smolensk. The town has spacious streets and a large octagonal square occupied by the principal buildings, among others the palace of the Greek archbishop and the bazaar. It is surrounded by ramparts and is fortified by a citadel on a commanding height.

The staple manufacture is tobacco; and the trade with Riga, Memel, Dantzic, and Odessa, chiefly in leather, wax, honey, potash, oil, and grain, is very extensive. Pop. (1897), 43,106, many being Jews. The government, bounded north by Vitebsk, east by Smolensk, southeast by Orel, south by Czernigov, and west by Minsk, is about 210 miles long from north to south by 112 miles broad, and has an area of about 18,545 square miles. The surface, though in the line of watershed which divides Europe into two great basins, is generally flat, and sends its waters chiefly to the South Dwina, but partly also to the Dnieper. The soil is fertile, though very imperfectly cultivated, and the forests, chiefly of oak and fir, cover extensive tracts. The principal mineral is bog iron ore. Both trade and manufactures are limited. Pop. (1897) 1,708,041.

Another Mohilev in the government of Poldsk, on the left bank of the Dniester, 60 miles east-southeast of Kamenetz, had a population (1897) of 22,093.

Mohldenke, mōl'dēn-kē, **Charles Edward**, American Egyptologist: b. Lyck, East Prussia, 10 Oct. 1860. He was graduated from Columbia in 1879, and from the University of Strasbourg in 1884. He has published: 'The Egyptian Origin of Our Alphabet' (1886); 'The Trees of Ancient Egypt' (1886); 'The New York Obelisk' (1891); 'The Tale of the Two Brothers' (1898); 'Egyptian Classics' (1900).

Möhler, mē'lēr, **Johann Adam**, German Roman Catholic theologian: b. Igersheim, Wurtemberg, 6 May 1796; d. Munich 12 April 1838. He studied theology at Tübingen, became professor there in 1822, and in 1835 was called to a chair in Munich. He was an able doctrinal disputant and did much to arouse the German Roman Catholic Church to new vigor. He wrote 'Unity of the Church' (1825); 'Athanasius the Great' (1827); 'Symbolism, or Exposition of the Doctrinal Differences between Protestants and Catholics' (1832; English version by Robertson), and, a reply to the works of Baur and others against his 'Symbolism,' in 1834 'New Investigations on the Doctrinal Differences between Catholics and Protestants.' He was one of the great theologians of the century. Consult the biographies in German by Friedrich (1894) and Knöpfler (1896).

Mohocks, mō-hōks, **The**, a club in London, England, also known as the Mohawk Club, which had a scandalous existence in 1711-12. "The avowed design of their institution was mischief." Gay mentions in 'Trivia,' that the Mohawks rolled women in hogsheads down Snowhill, and Swift told Stella of a report that 80 of them had been put into prison; while Lady Wentworth, writing to her son Lord Strafford, says, "I am very much frightened with the fyer, but much more with a gang of devils that call themselves Mohocks." A royal proclamation was issued against them 18 March 1712.

Mohr, mōr, **Charles Theodor**, American botanist: b. Esslingen, Germany, 28 Dec. 1824; d. Asheville, N. C., 1901. He was educated at the Polytechnic School in Stuttgart and in 1845 made a trip to Dutch Guiana in the interest of botany. He removed to the United States in 1848 and in the following year went to California where his health soon became impaired and he returned to the east engaging in the drug

business in Louisville, Ky., and later in Mobile, Ala. He was employed in various botanical and forestry investigations under the State and United States governments. In 1884 he was appointed botanist of the Alabama Geological Survey and in 1889 became agent of the forestry division of the United States Department of Agriculture. He published: 'The Timber Pines of Southern United States' (1896-7); 'Notes on the Red Cedar'; 'Plant Life of Alabama'.

Mohr, one of the larger of the West African gazelles (*Gazella mohr*), notable especially as the source of the "mohr-stones," or bezoars, derived from these animals and highly esteemed by the Arabs of Morocco and Algeria.

Mohs, **Friedrich**, frēd'rīh mōs, German mineralogist: b. Gernrode 1774; d. Agordo, Lombardy, 29 Sept. 1839. He studied at Halle and the mining academy at Freiberg, in 1811 became professor of mineralogy at Grätz, and later held similar posts at Freiberg and Vienna. He is known as the inventor of a new system of classification for minerals, which regards, in the collecting of species into higher groups, only their external characteristics. He published: 'Die Charaktere der Klassen, Ordnungen, Geschlechter und Arten oder Charakteristik des naturhistorischen Mineralsystems' (1820); 'Grundriss der Mineralogie' (1822-4, in English 1825); etc.

Moidore, moi'dōr (from the Portuguese, *mada d'ouro*, literally, coin of gold), a gold coin formerly used in Portugal (from 1690-1722), worth about \$5.

Moire, mwär, a French name for watered silks. Though made in the same way as ordinary silks, these are of double width, and must be of a stout substantial make. They should also be folded in such a way that the air contained between the folds should not be able to escape easily. They are subjected to an enormous pressure, of from 60 to 100 tons, generally in a hydraulic machine, and the air, in trying to escape, drives before it the small quantity of moisture that is used, and hence is effected the permanent marking called watering, which is for the most part in curious waved lines. The finest kinds of watered silks are known as *moires antiques*. Woolen fabrics to which the same process has been applied are called *morcen*.

Moise, **Edwin Warren**, American lawyer and soldier: b. in Charleston, S. C., 21 May 1832; d. Sumter, S. C., 8 Dec. 1902. At 15 he left school and after working in a wholesale grocery, studied law. In 1856 he opened a law office. Although opposed to secession, being a Douglas Democrat, and taking the stump against the movement, at the outbreak of the Civil War he organized a company at his own expense, and became its captain. In 1863 he was made major of the 7th Confederate cavalry, and near the close of the War was appointed colonel. He was in the army of Northern Virginia under General Lee, participating in every prominent battle. After the war he settled in Sumter and became a successful lawyer. In 1876 he was elected adjutant and inspector-general on Wade Hampton's ticket, and re-elected in 1878. In 1885 he was presidential elector.

Moise, **Penima**, American poet: b. Charleston, S. C., 23 April 1797; d. Charleston 13 Sept. 1880. A personality of much charm, whose charac-

ter is still held in loving memory by all who knew her. Her poetical gifts were early evidenced and her contributions to the press of her day were many. Her hymn book, written for the Charleston Beth Elohim Congregation, is still utilized, and was a pioneer in its field. Despite her blindness in her later years, she continued to write poems, and her home was a place of pilgrimage to a host of admirers.

Moissan, Henri, ôñ-rê mwâ-sân, French chemist: b. Paris 28 Sept. 1852. He was educated at the Museum of Natural History in Paris, and at the School of Pharmacy; taught in the Higher School of Pharmacy 1879-83, and then (1886) became its professor of toxicology. He isolated and liquefied fluorine, thus winning in 1887 the Lacaze prize from the Academy of Sciences; was transferred to the chair of mineral chemistry in the School of Pharmacy in 1889; and there won great fame by his important experiments and achievements with the electric furnace. In 1892 he made the manufacture of acetylene simple and commercially profitable by his discovery that if carbon and lime be fused in the electric furnace pure calcium will be formed, which makes the liberation of acetylene an easy matter. Much more spectacular was his formation of diamonds in 1893; iron was melted in the electric furnace and saturated with carbon; the furnace at a temperature of more than 4000°C. (that is, more than 7200° F.) was plunged into cold water; the resulting ingot was attacked with hot aqua regia; the iron was thus dissolved and diamonds were disclosed. Moissan wrote 'L'isolement de Fluor' (1886); 'Réproduction du Diamant' (1893); 'Etude complète des Carbones amorphes et des Graphites' (1898), and various articles for Fremy's 'Encyclopédie Chimique.'

Moisture. See RAINFALL.

Mokaddasi, mōk'a-dā-sē, Arabian geographer: b. Jerusalem 946. His name is derived from his birth-place and signifies merely 'of Jerusalem.' He was well educated and after a pilgrimage to Mecca in 965, devoted himself to travel. His critical sense makes his work the most trustworthy by any Mohammedan geographer. Two editions of it were published in his life-time; it was edited by De Goeje in 1877; and the part relating to Syria and Palestine appeared in an English version by Le Strange in 1886. Consult Le Strange, 'Palestine Under the Moslems' (1890).

Mokanna, mō-kān'na, **Al** (HAKIM-BEN-ALLAH), styled the 'Veiled Prophet,' Mohammedan impostor of the 8th century. He hid his face under a veil, a proceeding which his followers ascribed to the splendor of his countenance. He attributed to himself divine powers, and is said, by means of his chemical and other knowledge, to have performed apparent wonders. He gained many followers, so that at last the Caliph Mahdi was compelled to send an armed force against him. He retired to a fortress in Transoxiana, where he first poisoned his soldiers, and then burned himself. His followers continued to pay him divine honors after his death. He is the hero of Moore's 'Veiled Prophet of Khorassan' in the first part of 'Lalla Rookh' (1817).

Moki, mōk'ē, or **Hopi**, a Pueblo tribe of Shoshonean Indians inhabiting north central

Arizona. They are mesa-dwellers, their seven villages, chief of which are Walpi and Oraibi, being situated upon three mesas difficult of access, several hundreds of feet above the desert lands around. The inhabitants of the small village of Hano are of Tanoan stock, and speak a different language, being descendants of refugees from the Rio Grande who migrated in 1680 at the time of the Pueblo rebellion. The Moki are of an industrious and provident nature, successful cultivators, keeping their granaries always well stocked with agricultural produce; they are also noted for their manufactures of pottery, baskets, and blankets, and for their wood-carving. They number about 1,500 and are descendants of tribes who according to the evidence of the ruins scattered around have inhabited the region for several generations. Their traditional ceremonials include the now widely-known "snake dance," which is performed with live rattlesnakes carried in the mouth, the "winter solstice," and the "new fire."

Mola, Pietro Francesco, Italian painter: b. Coldre, near Como, 1612; d. Rome 13 May 1666. At an early age he went to Rome, where he studied painting under Prospero d'Orsi and Giuseppe Cavaliere d'Arpino. He afterward painted at Venice, Milan, and Bologna, in which last city he adopted the style of the local painters, especially Albani. His landscapes are of special excellence. The English National Gallery possesses his 'St. John Preaching in the Wilderness,' and 'The Repose of the Holy Family in the Flight into Egypt.' In the Ravenna chapel of the Church of Jesus at Rome is his 'Peter in Prison' and in fresco 'The Return of Peter to Rome.' He also painted the 'History of Joseph' in the Quirinal Palace. Others of his works are to be seen in the Louvre, the Pinakothek at Munich, and the Dresden Gallery. He was one of the followers of Annibale Caracci, whose manner he reproduced with ease and dexterity, but he was lacking in imaginative depth, while his indebtedness to Albani and Guercino is too evident.

Molasses. See SUGAR.

Molay, Jacques Bernard de, zhāk bār-nār de mō-lā, French knight-templar, last master of that Order: b. Burgundy about 1243; d. Paris 11 March 1314. He entered the Order of the Templars in 1265, and became its grand master in 1298. In 1306, while he was in Cyprus busy about raising new troops against the Saracens, he was summoned to France by Pope Clement V. Philip the Fair, fearing, it is alleged, the power of the Order in France, seized Molay and all the knights then resident in France, after receiving them with the greatest kindness; charged the Order with heresy, tried them before a packed court; and found them guilty. Molay was imprisoned and terribly ill-used for more than five years, and then was burned at the stake. The guilt of the Templars is still a disputed historical question. Consult Prutz, 'Entwicklung und Untergang des Tempelherrenordens' (1888).

Moldau, mōl'dow, a river of Bohemia, which rises in the Schwarzbürg, on the frontiers of Bavaria, flows first southeast to Rosenberg, where it turns almost due north, and continuing that direction, in a circuitous course, passes

MOLDAVIA—MOLECH

Budweis. After receiving several tributaries, it traverses the town of Prague, and after turning due east, joins the Elbe on the left, 17 miles north of Prague. Its whole course is about 230 miles. It begins to be navigable at Rosenberg, where its north course commences, but at first only for shallow barges. Below Prague it floats vessels of 50 tons. It abounds with fish.

Moldavia, mōl-dă-vî-a, Rumania, a northern division of the kingdom since 1861, when the union of the former principalities of Wallachia and Moldavia as the Principality of Rumania was proclaimed. See RUMANIA.

Mo'ling, or **Moulding**, (1) in carpentry, a method of ornamentation by grooved or swelling bands, or forms following the line of the object. There are numerous varieties, as the bead, the astragal, the cavetto, the echinus, the fillet, the fascia, the ovolo, the ogee, the cyma, the recta or reversa, the quirk, the bolection, etc. (2) In mining, the ore found on the top of veins near the surface of the ground. (3) In shipbuilding, giving the correct outline and depth to ship's timbers, etc.; it is one part of the operation of forming. (4) In architecture, a term applied to all the varieties of outline or contour given to the angles of the various subordinate parts and features of buildings, whether projections or cavities, such as cornices, capitals, bases, door or window jambs and heads, etc. There are eight sorts of regular moldings: namely, the ovolo, the talon, the cyma, the cavetto, the torus, the astragal, the scotia and the fillet. See also ARCHITECTURE.

Molé, Louis Matthieu, loo-ê mât-tê-ê mō-lâ, French statesman: b. Paris 1584; d. there 3 Jan. 1656. His integrity and fearlessness often resisted the arbitrary measures of the despotic Richelieu; and under the no less ambitious but less vigorous Mazarin, he acquired the esteem of all parties. In 1641 he was appointed first president of the Parliament through the influence of Richelieu, whom he had opposed in the process against the Marshal de Marillac. The disturbances of the Fronde soon after commenced. In this contest of factions Molé defended with equal prudence and sagacity the interests of justice and freedom, as well as those of the court; and when Paris became the theatre of tumults, conducted himself with so much firmness and dignity that his bitterest enemies could not withhold from him their approbation; and even Condé and Cardinal De Retz were forced to esteem him, although his unshaken rectitude and devotion to the welfare of the nation and the safety of the throne frequently frustrated their designs. He was more than once threatened with personal violence by the furious partisans of the Fronde, whom he overawed by his inflexible dignity. In the memoirs of De Retz and other records of the time of the regency of Anne of Austria and Mazarin, Molé's happy influence in the troubled state is everywhere perceptible. His 'Memoirs,' bearing on the stirring events in which he acted so great a part, were published in 1855.

Mole, a small insectivorous mammal of the family *Talpidae*. They are related to the still smaller shrews (*Soricidae*), from which the typical species may be distinguished by having the external ears so short that they are completely concealed in the fur, the fore feet broad

and shovel-like, the skull provided with an auditory bulla and a zygomatic arch, and numerous other characters. The moderate number of species, belonging to 11 genera, are found only in the temperate portions of the Northern hemisphere. Three species, the common mole (*Scalops aquaticus*), the hairy-tailed mole (*Parascalops breweri*) and the star-nosed mole (*Condylura cristata*) occur in the Eastern United States. A fourth genus (*Scapanus*), with six species, is confined to the Pacific coast. The second is the smallest and is also distinguished by its densely hairy tail and numerous teeth. It is not common and is found chiefly in mountains and about evergreen forests. The star-nosed mole is known at once by the rosette of fleshy processes on the snout, and its larger size; both it and the common mole are abundant in cultivated lands and pastures, the former preferring moist, the latter dry lands. Their habits differ only in details. Moles are eminently fossorial—a mode of life for which they are by structure peculiarly adapted. They construct underground nests lined with soft grasses, from which several passages run off in different directions, and by branching become finally divided into a network of burrows which daily enlarges as the animal searches for the earthworms and insects on which it almost exclusively feeds. They seldom come to the surface except just at noon—a habit which has been repeatedly observed but never explained. The young are born in the nest and some species raise two broods. Notwithstanding its scientific name the common mole shuns water while the star-nosed mole shows a decided predilection for its vicinity and is an expert swimmer. Consult Stone and Cram, 'American Animals' (1903).

Mole, a long pier or breakwater built of masonry and extending into the sea, at times to a distance of a mile or more. In San Francisco Bay are two of these piers, the Oakland Mole and Alameda Mole. The railroad extends to the end of these moles and connects with a line of ferry-boats.

Mole. See NÆVUS.

Mole Cricket. This insect is most appropriately named, for it combines the characteristics of the crickets (*Gryllidae*), to whose family it belongs, with some of the habits and special adaptations of the moles. The mole-cricket dig winding burrows in the loose soil on the borders of ponds and ditches, raising ridges like miniature mole-hills. In their subterranean wanderings they cut the roots of plants, upon which, as well as upon earthworms and larvæ, they feed. A Porto Rican species (see CHANGA) does serious damage to crops. The European mole-cricket lays several hundred eggs in an underground chamber where they are guarded by the female, though many of the young are later devoured by the male. Probably ours have similar habits. The species occurring in the eastern United States are *Gryllotalpa borealis* and *G. longipennis*. They may be recognized by their large brown bodies with a velvet-like covering of fine, close hair, short wing covers, and fossorial front legs, not unlike the great paws of a mole.

Mo'lech. See MOLOCH.

MOLECULAR THEORY

Molecular Theory, in physics and chemistry, the theory which teaches that matter, however homogeneous it may appear to be, is in reality a heterogeneous aggregate of ultramicroscopic particles called "molecules." In a crude form this idea was entertained and defended, even before the Christian era, by certain of the philosophers of Greece and Rome, among whom Democritus and Lucretius may be especially mentioned. The writings of these ancient authorities are of great interest to the historian, and are highly creditable when allowance is made for the state of science at the time they were produced; but they are of necessity too general and too nebulous to be of practical value to the modern physicist, who demands that every theory shall be tested by a critical comparison of its necessary consequences with the facts of observation.

The molecular theory in its present form may be said to be a development of the 19th century; for although the celebrated Swiss mathematician Daniel Bernouilli had suggested, in the 17th century, that gases consist of little molecules moving freely about among themselves, and that gaseous pressure is due to the collisions of these molecules with the walls of the containing vessel, and although other thinkers had made analogous suggestions which helped to prepare the way for the modern theory, it was the work of John Dalton, in chemistry, which gave the first great impetus to the molecular theory, by making it, in some form or other, almost a necessity of thought. Dalton showed (1805) that when substances combine chemically, they do so in certain definite proportions; and he concluded that the facts of this sort which he amassed could be best explained by assuming that matter consists of exceedingly minute particles, or "atoms," each of which has a definite weight, and that when bodies combine chemically, their atoms come together in pairs, or in threes, or fours, or in some other manner, according to the compound formed. (See ATOMIC THEORY.) It was shortly afterward observed that when gases combine, they do so in accordance with certain simple volumetric laws. One volume of hydrogen, for example, combines with one volume of chlorine, to form two volumes of hydrochloric acid gas; and two volumes of hydrogen combine with one volume of oxygen to form approximately two volumes of steam-gas. To bring facts of this sort into harmony with Dalton's theory, it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of molecules per unit of volume. With these tangible evidences of the molecular structure of matter as an incentive, physicists and chemists set themselves the task of testing, in all conceivable ways, the consequences of such a theory; and in the course of a century of experimental and mathematical study, no fact has been discovered which tends to controvert the fundamental doctrine that matter has a molecular structure. The molecular theory, in some form, is therefore confidently believed to be true by practically all physicists and chemists. The observations which have been made, and which must be harmonized and explained by the molecular theory, are so numerous and so varied, however, that no single set of mutually consistent hypotheses about the

nature of molecules has yet been proposed, which demonstrably explains everything that is known about matter. The chemist and the physicist have worked along lines that are widely different, the chemist investigating the phenomena that are observed when two or more definite substances combine so as to produce one or more new substances, while the physicist has confined his attention chiefly to the mechanical, thermal, electrical and magnetic phenomena that are observed in connection with definite substances whose chemical constitution remains unchanged. It is small cause for wonder (or for criticism), that identical conceptions of the structure of a molecule have not resulted from investigations of such a widely different character; and there is, thus far, no reason for doubting that the chemical and physical conceptions of a molecule will draw nearer together when further study has been given to solutions, to electrolysis, to the thermodynamics of chemical changes, and to other similar subjects whose discussion involves the consideration of changes which are partly chemical and partly physical. There is much evidence, already, to indicate that the "affinity" that chemical substances have for one another is of an electrical character; and when the physicist has arrived at a more definite knowledge of the ultimate nature of electricity, it is possible (and even probable) that this knowledge will go far to clear up the mysteries of chemical affinity, and consolidate chemistry and physics into a single science.

It has been abundantly proven that the "atom" of the chemist and the "molecule" of the physicist are (in general) different things; a molecule being a system formed by the union of a definite number of atoms, combined in a definite way. The molecules of a given substance are the smallest parts into which that substance can be conceived to be divided, without changing its chemical character; while the atoms are the proximate constituents through whose immediate combination the molecule is formed. (The word "proximate" is employed here, because the modern school of physicists to which Professor J. J. Thomson belongs have sought to show that the atoms are composed of still more minute bodies called "electrons," which may be regarded as the ultimate constituents both of the atom and of the molecule.) The molecules of most of the substances that are considered in inorganic chemistry are comparatively simple in structure. Hydrochloric acid gas, for example, is composed of molecules which each contain one atom of hydrogen combined with one atom of chlorine, as indicated by the formula HCl ; and water (at least in the form of steam-gas) is composed of molecules which each contain one atom of oxygen combined with two atoms of hydrogen, as indicated by the formula H_2O . In organic chemistry molecules occur which apparently contain hundreds of constituent atoms, and the comparative stability of such systems is hard to understand, on any hypothesis. The chemical elements consist of molecules, just as compound bodies do; but in any given element the constituent atoms are believed to be all alike.

In the molecular theory as entertained by the physicist, the molecules of a body are commonly considered as small material systems which do not exert any chemical affinity for one another, but which may act upon one another by any of

MOLECULAR THEORY

the so-called "physical forces," such as gravitation, electric and magnetic attraction and repulsion, and elastic pressure due to collision or impact. They are also considered, usually, to possess inertia, and to be subject, in general, to the same laws of motion as apply to the larger bodies of our familiar experience. (See MECHANICS.) In the "electron theory," to be subsequently mentioned, very different laws of motion are assumed; but the electron theory, although very promising, is not yet thoroughly tested, and is likely to be profoundly modified in many respects before it receives general acceptance, and hence the older doctrines with respect to molecules will be first considered, and the more important features of the newer and less developed theory will be given afterward.

One of the most fundamental assumptions of the molecular theory in its usual form is that the molecules of any one chemical substance are identically alike in all respects. This point was tested by Graham, in the case of hydrogen, by passing the gas through a series of porous partitions, and comparing the final hydrogen, as it issued from the last partition, with the original gas. No difference could be observed, and hence it was concluded that hydrogen, at least, is not a mixture of dissimilar particles; because it is known that a mixture of different gases, whose molecules are different in size, can be partially separated by a diffusion process of this kind. Stas, the great Belgian chemist, investigated this question by determining the atomic weight of a given element as prepared in different ways, and from different sources; and he found that the results obtained under these varying conditions were indistinguishable from one another, even when his work was so accurate that a variation in the atomic weight of the hundredth part of one per cent could hardly escape detection. It cannot be considered to be proved, however, that the molecules of any one substance are alike in every way, in the sense that a hundred standard machine screws are alike, for the question has not yet been tested exhaustively enough. Graham's method and Stas' method furnish evidence to which proper weight should be given, but they cannot be said to be conclusive. Neither can we admit the evidence of the spectroscope to be conclusive, although it indicates that the internal vibrations of a molecule of hydrogen (for example) are performed with the same rapidity, whether the hydrogen is obtained from water, or from organic bodies, or from the gases that are occluded by meteorites, and brought to us from the depths of space. The identity of molecules of the same substance is nevertheless a fundamental assumption of the usual molecular theory, and it will be assumed in the present article.

All matter may be classified, for present purposes, as (1) gaseous, (2) liquid, or (3) solid. (See MATTER.) Gases are assumed to consist of molecules which are distributed through the space occupied by the gas in such a manner that the average distance from one molecule to the next one is large in comparison with the diameter of any one molecule. The molecules are all believed to be in rapid motion, so that from time to time they collide with one another; and when a collision occurs, it is believed that the molecules that come together rebound again as if they were perfectly elastic bodies. They have motions of rotation as well as of translation, and

the collisions affect both the rotative and the translatory velocities of the colliding molecules. A system composed of a practically infinite number of bodies of this sort will have certain properties which are considered in the article GASES, KINETIC THEORY OF, and shown to be in general agreement with the properties of the actual gases of nature. The molecules of a gas undoubtedly attract one another under ordinary circumstances; but it is assumed that they are so far apart during the greater part of the time, that the attractive forces that exist do not have any great effect upon the motions of the system as a whole. The path of a molecule of gas, between two successive collisions, is called the "free path" of the molecule, and is believed to be sensibly straight, owing to the high velocities that the molecules of a gas have on the average, and the (assumed) fact that the attractive forces are unimportant at distances comparable in magnitude with the mean "free path." It may be shown by the methods of the kinetic theory of gases that the average velocity of a hydrogen molecule, at atmospheric pressure and at the freezing point of water, is about 5,571 feet per second. The average velocities of several other familiar gases, under the same conditions, are as follows: Oxygen, 1,394 feet per second; nitrogen, 1,488; carbon monoxid, 1,491; carbon dioxid, 1,189. Clausius deduced, from the kinetic theory of gases, a formula giving the mean free path of a gas in terms of the temperature of the gas, its density at 32° F. and under a pressure of one atmosphere, and its "coefficient of viscosity." (See VISCOSITY.) With the experimental data that have been obtained for the coefficients of viscosity of the more familiar gases, the following values of the average free paths of the molecules of these gases are obtained from the formula in question, the unit in each case being the ten-millionth part of an inch, and the gas being supposed to be exposed to a pressure of one atmosphere, and a temperature of 32° F.: Hydrogen, 67; nitrogen, 36; oxygen, 38; carbon monoxid, 36; carbon dioxid, 25. If the average speed of translation of a gaseous molecule, in inches per second, be divided by the length of the average free path in inches, the quotient is the number of collisions that the molecule experiences, on an average, per second. In this way it may be shown that in hydrogen at the density and temperature given above, each molecule experiences, on an average, 10,040 million collisions with its neighbors per second. The corresponding numbers of collisions for the other gases (in millions per second) are as follows: Nitrogen, 5,021; oxygen, 4,410; carbon monoxid, 5,014; carbon dioxid, 5,741. The length of the free path of a given gas is increased, when the density of the gas is diminished, in the exact inverse ratio of the change in density. In an exhausted tube containing hydrogen, for example, at a density one one-millionth of the density assumed above, the mean free path of the molecules would be a million times as great as the value given for hydrogen at the normal density;—that is, the free path at this particular exhaustion would be 6.7 inches, so that the molecules would travel, on an average, over six inches between successive collisions. As the kinetic theory of gases assumes that the molecules collide with one another after traveling distances that are

MOLECULAR THEORY

negligible in comparison with the dimensions of the whole mass of gas under consideration, its conclusions, when applied to gaseous masses in which this condition is not fulfilled, must be received with proper caution. Clausius' formula, for example, is itself doubtful when applied to the extreme case in which the density of the hydrogen is only a millionth of the normal value. It is certain, however, that the free paths of gas molecules at such high exhaustions are to be measured in inches, and it is also certain that the pressure is not necessarily equal in all directions in vacua of this degree of perfection, since it is by means of the incessant collisions that this equality of pressure is brought about at ordinary densities. For these reasons (among others) Sir William Crookes considered that highly attenuated gases, in which the pressure is a millionth of an atmosphere or less, should be considered as constituting a "fourth state" of matter, essentially distinct in its properties from the three states that are commonly recognized. He also devised the radiometer and other instruments, to show the reality of the differences of pressure that can exist in high vacua. In recent years it has become increasingly probable that in certain forms (at any rate) of the apparatus devised by Crookes,—in those forms, namely, in which "cathode rays" are generated by the action of powerfully excited electrodes,—the mechanical effects that are observed are not due directly to the motions of the gas molecules themselves, but rather to the motions of the free "electrons" of which these molecules are ultimately composed, and which are liberated by the disintegration of the gas molecules under the influence of the powerful electric discharge. Crookes himself appears to have held views not essentially different from this, though at the time they were stated they were clothed in language that was necessarily rather indefinite, since the electron hypothesis had not then taken form. (See ELECTRON; RADIATION.)

In liquids, the molecules are supposed to be so near together that the attractive forces that they exert upon one another are powerful at all times. The kinetic theory of liquids is very imperfectly understood, but it is considered certain that collisions occur among the molecules just as they do in gases, and that the colliding molecules rebound from one another like perfectly elastic bodies. In liquids, however, there is nothing strictly analogous to the "free path" in gases; for the liquid molecules are always exposed to attractive forces of considerable magnitude, and hence in the intervals between successive collisions they describe paths that are everywhere markedly curved. There is, doubtless, as great a variety of velocities among the molecules of a liquid as among those of a gas, but the law of distribution of velocities among liquid molecules has not yet been determined, on account of the mathematical difficulties that are involved, and which have thus far proved insuperable. Admitting the fact that the velocities of the molecules are unequal, let us consider what would happen at a free surface of the liquid, assuming for the moment that above this free surface there is a boundless vacuum. A molecule that is well within the liquid is attracted, on the whole, equally in all directions. A molecule at the surface, however, is attracted only downward. Hence it is

evident that when a molecule, in the course of its wanderings, comes to the surface, the possibility of its escape from the liquid depends upon the magnitude of the vertical component of its velocity. If this vertical component is sufficient to carry the molecule beyond the range of sensible attraction of the liquid, the molecule will pass away indefinitely into the space above. On the other hand, if the vertical component of its velocity is not sufficient to carry the molecule beyond the range of sensible attraction of the liquid, it will rise into the vacuous space only a short distance, its upward velocity growing less and less, under the influence of the downward attractive forces, until it vanishes altogether; after which the molecule will begin to fall back, and it will finally plunge into the liquid again. From the slowness with which free evaporation takes place, we must conclude that by far the greater part of the molecules that start upward fall back into the liquid. Those that do escape by reason of their great velocities carry off more than their equable share of the kinetic energy of the molecules of the liquid, and this causes the average kinetic energy of the liquid, per molecule, to grow continually less. In other words, free evaporation causes a reduction of the temperature of the mother liquid. When the liquid is enclosed in a containing vessel of finite volume, the phenomena are somewhat different, after the evaporation has proceeded for a time. If the space above the liquid is vacuous at the outset, the evaporation, at the first instant, takes place precisely as before. Of the molecules that come to the surface of the liquid, those that are moving most rapidly in a vertical direction fly off as in the case previously considered; but they can no longer pass away indefinitely into space. They are now retained in the vessel, in which they will accumulate, constituting a gas or vapor whose density will go on increasing until a certain limit is reached. The molecules composing this vapor will travel in every direction, precisely as they do in other gaseous bodies. Many of them, therefore, will plunge back into the liquid again, and become an integral part of it once more. Now the number of molecules that leave the mother liquid in a given time will be quite independent of the density overhead; but the number that fly back into it again, in a given time, will be greater, the greater the density of the vapor. At the beginning of the evaporation the vapor will be quite rare, and the number of molecules that fly off in any given time will greatly exceed the number that return during that time. The density of the vapor will therefore increase. After a certain interval (exceedingly short as measured by ordinary standards), the density of the vapor will become so great that the number of molecules plunging back into the liquid in a given time will become sensibly equal to the number that fly off from it in the same time. When this adjustment becomes perfect, the density of the vapor will no longer increase. It is then said to be "saturated," and its density will remain constant until the temperature of the system is altered. If the temperature be now raised, all the molecules will be accelerated, and hence more molecules will plunge from the vapor into the liquid in a given time than before, and more molecules will also come to the surface of the liquid from the interior. Furthermore, of the increased

MOLECULAR THEORY

number of molecules that emerge from the interior of the liquid, a larger proportion than before will have velocities exceeding the critical velocity that a molecule must have in order to escape from the attraction of its fellows. Hence, on the whole, the density of the vapor will increase, approaching a new limit at which the number of in-coming and out-going molecules will again become equal. It follows, therefore, that for any vapor in contact with its liquid, there is a definite density corresponding to each temperature. The existence of a critical point (q.v.) may be explained in a similar manner, by considering the average kinetic energy that a molecule must have in order that it may be able to pass away from the attraction of other molecules in its immediate vicinity. A stone thrown upward by the hand does not proceed far before the attractive force of the earth annuls its velocity and causes it to fall back again. A rifle will project a ball far higher, but the ball will eventually fall back, just as the stone did. With a good modern cannon we can throw a projectile several miles into the air,—and still it falls back. But we might conceivably project one with such a speed that it would leave the earth forever. It may be shown, in fact, that if the retarding action of the air is omitted from consideration, an initial vertical speed of 36,700 feet per second would be quite sufficient. With this much premised, conceive two molecules of a gas to be in contact, and let a sudden impulse be given to one of them, to drive it away from the other one. If the impulse is small enough, the disturbed molecule will only travel a short distance, and will then fall back to its original position; but we may give it such a speed that the attractive force of the fixed molecule will fail to bring it back, and in this case it will travel onward indefinitely. Now, just as in the case of the cannon-ball and the earth, there must be some intermediate initial speed that will be *just sufficient* to separate the two molecules under consideration. We may call this the "critical velocity," and we may say that if the molecules of a gas are moving about so that, on an average, when two of them collide they have a relative velocity greater than this critical value, the gas in question cannot be liquefied by pressure alone; for even if its molecules were forced almost into absolute contact with one another, their velocities would be sufficient to separate them again indefinitely, as soon as the pressure was removed. From this, and from the relation between temperature and molecular velocity in gases (see GASES, KINETIC THEORY OF), it follows that for every gas there is a temperature above which the gas cannot be liquefied by any pressure whatever.

Very little is known about the molecular constitution of solid bodies. The most obvious property of a solid is, that it preserves its shape so long as it is not acted upon by external forces. Moreover, when such forces are applied, the solid indeed becomes deformed, but it eventually regains its original shape after the forces have been removed, provided they did not exceed a certain magnitude called the "elastic limit," which is peculiar to the solid under examination, and to the way in which the forces were applied. We are obliged to conclude, from these facts, that the molecules of a solid are not free to roam about, but that some or all of them have determinate mean positions about

which they may oscillate and rotate, but from which they never permanently depart except when constrained to do so by an external force great enough to overcome the internal forces (whatever they may be) which normally determine the mean positions of the molecules. Some solids are brittle toward forces that are suddenly applied to them, although they yield slowly, and after the manner of a viscous fluid, to smaller forces that are applied continuously for a long time. A mass of cold pitch, for example, may be easily shattered by a blow, and yet when allowed to rest for a sufficient time upon an inclined plane, it yields gradually to the relatively insignificant force of gravity, loses its shape, and very slowly flows down the plane. It is evident that solids of this character must have exceedingly complicated structures. Maxwell suggested that they consist of two kinds of molecular groups, of which one is more stable than the other, and he supported his argument with considerable ingenuity. His views were purely speculative, however, and it appears to be fairly evident that the first advances that we make toward a good understanding of the molecular structure of solids must be based upon a study of bodies of crystalline nature, like quartz and iron.

It is certain that in crystals there is some definite regularity of orientation, either in the molecules themselves, or in their motions; and it may be fair to assume that this regularity is of such nature that any given molecule, in its vibratory excursions, never passes outside of a certain imaginary ellipsoid, which may be conceived to be described about the mean position of the molecule. Crystals may then be regarded as aggregates of such ellipsoids, piled up in such a way that the corresponding axes of all of them are either parallel throughout the mass, or at least arranged in accordance with some definite geometrical scheme. When a substance crystallizes, either from solution or from a state of fusion, the ellipsoids that bound the crystal molecules must necessarily arrange themselves so that the potential energy of the resulting solid is as small as it can be, consistently with the conditions under which the solidification takes place. For the sake of illustrating the application of the molecular theory to the explanation of crystal structure, we may assume the ellipsoids to be simple spheres, and we may also assume that the potential energy of the system is least when the spheres are grouped together as closely as possible. The problem of crystal structure is then reduced, in its geometrical aspect, to the simple one of finding out how to pack the greatest number of equal spherical balls into a given space; and in order to properly comprehend the principles that are involved, a little patient experimentation with a liberal supply of buckshot or spherical bullets is desirable. It will be found that pyramids can be built with them, apparently in several ways; though the internal structure of the pile is really the same in all cases. The slant faces of these pyramids correspond to the plane faces of the actual crystal. When a crystal is forming (say by deposition from a solution) we are to conceive that a continuous series of exchanges is going on, all over its surface. Molecules of the dissolved substance are caught by the attraction of the growing crystal, but, on the other hand, molecules of the solidified crystal are con-

MOLECULAR THEORY

tinually passing into solution again; and the gradual increase in size of the crystal is due to the fact that in a unit time more molecules are caught by it than are lost again. Suppose, now, that the surface of a partially formed crystal is injured slightly, and let us represent the injury, in our shot pile, by removing a few of the shot from one of the faces of a pyramid. A molecule that happens to lodge in the injured place will be in contact with more of the other attracting spheres than it would touch if it were to collide with one of the uninjured parts of the crystal, and it will therefore be held more firmly in place. In the exchange of molecules between the crystal and the solution, a molecule thus embedded will be less likely to be torn away again; and this action tends to preserve the flatness of the faces of the growing crystal, and to cause the repair of damaged places to proceed with greater rapidity than the growth along normal, uninjured parts.

Attempts have been made to unify our knowledge of matter, by the comparison of what are known as "corresponding states" of different kinds of matter. The general conception of "corresponding states" is difficult to define, and the sense in which the phrase is used may be best illustrated, perhaps, by the following simple illustration. Two gases which are at their respective critical points (see CRITICAL POINT) may be considered to be in corresponding states. Let P_1 , V_1 and T_1 be, respectively, the critical pressure, the critical volume of a unit mass, and the critical temperature (on the absolute scale) of one of these gases, and let the pressure, volume and absolute temperature of this same gas in any other state be represented by P , V and T . Instead of measuring these last quantities in the usual units, let them be expressed as fractions of the corresponding critical values; so that the pressure, volume and temperature of the gas will be respectively P/P_1 , V/V_1 and T/T_1 , as expressed in the new units. In the same manner, let the pressure, volume and temperature of the second gas be expressed in terms of the critical constants of the second gas. Then the two gases are said to be in "corresponding states" whenever the pressure, volume and temperature of the first gas are respectively equal to those of the second one, when all are expressed in this manner. The idea of "corresponding states" was discussed at some length by Van der Waals (*'Continuité des Etats Gazeux et Liquides'*), and has also been employed by Gibbs and others for various purposes.

It has been said, above, that the molecules of bodies attract one another. We do not know much, however, about the mechanism by which the attraction makes itself felt, nor even about the law in accordance with which the attraction falls off with increasing distance. It would be natural to assume it to vary as the inverse square of the distance, but it is usually held that there is good evidence that it falls off more rapidly than this, as the distance increases. Maxwell assumed, in certain of his writings, that the attraction varies as the inverse fifth power of the distance, but he apparently chose this law merely because it rendered certain of his equations more manageable. William Sutherland has advanced reasons for believing that the inverse fourth power is more nearly correct, for the distances that are commonest between the molecules of gases under ordinary

conditions of density. We do not even know that the forces between molecules are "central,"—that is, we do not know that the attractive force exerted by a molecule tends toward a definite point within the substance of the molecule. Helmholtz showed, in a paper published in 1847, that if the universe consists of smooth spherical molecules, which attract one another only by forces that are directed toward their centres, the great fact of the conservation of energy is a necessary consequence (see ENERGY); but unfortunately we now have good reason for believing that molecules are not bodies of this sort, and hence the principle of the conservation of energy must be regarded as a mere fact of observation. The distance at which the attractive force exerted by a molecule is still sensible is of course indefinite, depending as it does upon the delicacy of the means that are employed for the detection of the force. Maxwell showed that a soap-bubble would become unstable when its thickness is reduced until it is only equal to the radius of sensible molecular attractive power; and as Reinold and Rücker have shown that soap-films become unstable at a thickness of about one two-millionth of an inch, we may take this as a rough estimate of the limiting distance at which molecular attractive power ceases to be sensible.

The aggregate volume of all the molecules in a given mass of gas may be obtained, to a rough approximation, by several methods, among which we may mention the so-called "characteristic gas equation," which exhibits the relation between the pressure, density and temperature of a gas. Equations of this sort have been given by Van der Waals, Clausius and others, and in them a term occurs whose value depends upon the proportion that the bulk of the actual molecules bears to the total bulk of the gas that they constitute. The numerical magnitude of this term may be determined by experiments upon the variation of the pressure of a gas with temperature and density, and hence the aggregate bulk of all the molecules may be determined in a somewhat approximate manner. Roughly, it may be said that at ordinary densities, the actual total bulk of all of the molecules of a gas is from the thousandth to the ten-thousandth part of the bulk of the entire gas. Clausius has shown, from the kinetic theory of gases, that the diameter, D , of a gas molecule may be expressed in terms of the mean free path (L) and the proportion (B) of the total bulk of the gas that is actually occupied by molecules, by means of the simple equation $D = 8.5 LB$. When we know L and B it therefore becomes easy to compute the diameter of a molecule; but it must be remembered that the phrase "diameter of a molecule" has no very definite meaning at present, and cannot have until we know much more about the nature of molecules. In fact, to ask how big a molecule is, is much like asking "How big is a crowd?" Clausius' equation, when applied to the existing data for B and L , indicates that the diameter of a gaseous molecule is something like the fifty-millionth part of an inch. Treating the molecule as a sphere, we may then show that the number of molecules in a cubic inch of gas at 32° F. and one atmosphere of pressure is approximately 100 millions of millions of millions, though this figure can be regarded only as the roughest kind of an approximation.

We know practically nothing of the actual nature of a molecule. Some of the assumptions that have been made by mathematicians are explained in the article GASES, KINETIC THEORY OF; but it is not probable that these assumptions correspond in the least degree with the actual facts. Lord Kelvin has advanced the idea that they may be similar in structure to the smoke-rings that are blown by skilful smokers; that is, he has suggested that the molecules are vortices in the ether which is known to fill space. This theory is quite suggestive and helpful in some respects, but it can hardly be regarded as more than an interesting though improbable speculation. The electron theory of J. J. Thomson is more in favor at the present time (see ELECTRON), although it has not yet been fully tested. According to this view, molecules are built up of far smaller elementary corpuscles, or "electrons," about 1,000 of these being required for a hydrogen atom, 16,000 for an oxygen atom, 200,000 for a mercury atom, and so on, the number being proportional to the atomic weight of the element under consideration. These electrons are supposed to be all alike, and to be practically nothing but tiny detached charges of electricity, floating through the ether. They are believed to exist practically in the free state in the cathode rays that are visible in Crookes' tubes. According to this view, chemical affinity is merely an electric force acting between atoms, and the inertia of a molecule is merely a mathematical consequence of the extremely rapid motions of the electrons of which the molecule consists. It may be proved, indeed, that an electrified body in rapid motion possesses an apparent mass that is greater than the mass as measured by the ordinary methods of mechanics. At any ordinary velocity, this apparent increase in mass is probably not measurable; but at the high velocities which the electrons (for other reasons) are believed to have, the "pseudo-mass" may easily become as great as the real mass; and the present tendency is, to regard what we have called the "real mass" of a molecule as having no existence, and to attribute the mass of a body entirely to the enormous velocities of its constituent electrons.

Consult: Meyer, 'Kinetic Theory of Gases'; Kelvin, 'Popular Lectures and Addresses,' Vol. I.; Risteen, 'Molecules and the Molecular Theory.' J. J. Thomson's electron theory is too recent and too incomplete to find a place, as yet, in such treatises, and for this the current scientific periodicals must be consulted. See, however, Larmor's 'Matter and Aether.'

A. D. RISTEEN,

Editorial Staff, 'Encyclopædia Americana.'

Mole'skin, a fabric so called from its being soft like the skin of a mole. It is a strong twilled cotton fabric, cropped or shorn before dyeing. In the United States the word is also applied to the padded breeches worn by football players.

Molesworth, **SIR Guilford Lindsey**, English civil engineer: b. Milbrook, Hampshire, 3 May 1828. He studied at King's School, Canterbury, and at the Putney College of Civil Engineers; was apprentice to the chief engineer of the London and Northwestern Railway; was employed at Woolwich Arsenal during the Crimean war; went to Ceylon 1859, becoming

director-general of railways there in 1867; and in 1871 was appointed consulting engineer to the government of India. He received decorations for his services in the Afghan and Burma wars, and retired in 1889. He wrote a standard 'Pocket-Book of Engineering Formulae,' various other works on technical subjects, 'Imperialism in India' (1885); 'Reason and Instinct in Ants' (1886), and a prize essay 'Silver and Gold' (1891).

Molesworth, **môlz'wérth**, **Mary Louisa Stewart**, English writer of juvenile stories: b. Holland 1842. In 1861 she was married to Major Molesworth of the Royal Dragoons. Her earlier writings were novels under the pen-name "Ennis Graham"; she wrote her first children's stories about 1875 and gained an immediate success. Her more famous titles are: 'Carrots' (1876); 'The Green Casket' (1890); 'Meg Langholme' (1897); 'The Laurel Walk' (1898); 'The Grim House' (1899); 'This and That,' 'The House that Grew,' and 'Peterkin.' Among her later novels are 'Hathercourt Rectory'; 'The Red Grange.'

Molesworth, **SIR William**, English politician: b. London, England, 23 May 1810; d. there 22 Oct. 1855. In 1823 he succeeded as 8th baronet; studied at Cambridge, but was obliged to leave because of his having challenged a tutor to a duel, and completed his education at Edinburgh, and in Germany. He was a member of Parliament for East Cornwall 1832-7, for Leeds 1837-41, and for Southwark from 1845 till his death. In 1853 he became first commissioner of public works under the Earl of Aberdeen, and in 1855 was colonial secretary under Palmerston. The close friend of Bentham and James Mill, he was looked upon as the parliamentary exponent of the "philosophical Radicals." He founded the 'London Review' in 1835 and the next year merged it in the 'Westminster Review' which he had purchased, and contributed many articles to this organ of radicalism. He edited the complete works of Hobbes in 16 volumes and published them at his own expense. He is best known as having drawn public attention to the abuses connected with the transportation of criminals, and as having pointed out the maladministration of affairs in the colonial office, investigated the relations between the imperial government and the colonial dependencies, and expounded the true principles of colonial self-government.

Molfetta, **môl-fët'tä**, Italy, a seaport city in the province of Bari, on the Adriatic, 15 miles northwest of the city of Bari. It has a magnificent cathedral, several other churches, a college; manufactures of linen and salt-peter; a harbor, well sheltered except on the north; and a considerable trade in corn, oil, and fruit. Pop. (1901) 40,135.

Molière, **mô-lë-är** (assumed name of JEAN BAPTISTE POQUELIN, zhôn bâ-têst pôk-ë-län), French dramatist: b. Paris 15 Jan. 1622; d. there 17 Feb. 1673. His father was *valet de chambre* and upholsterer to the king. When his father had become debilitated he had to discharge his office about the person of Louis XIII. In 1641 he accompanied the king to Narbonne. The French theatre had at that time begun to flourish through the talents of the great Corneille; and young Pocquelin, who had imbibed a strong passion for the stage, now formed a

MOLIÈRE

company of young persons of similar tastes, exchanged his family name for that of *Molière*, and resigned the office of his father. His company soon became distinguished; and we find him at the head of a strolling troop, which acted 'L'Etourdi' at Lyons in 1653. This is the first comedy written in verse by Molière. The truth of the dialogue, the inexhaustible skill of a valet continually employed in rectifying the blunders of his master, the interest of the situations arising therefrom, have kept this piece on the stage notwithstanding the want of connection between the parts. Molière gained equal applause as a poet and an actor, and drew all the spectators from another company at Lyons. The art of representing character and manners on the comic stage was reserved for Molière. 'L'Etourdi' was acted with equal applause in Béziers. Here the Prince of Conti, who had known Molière at school, had just assembled the estates of Languedoc. He received the poet as a friend, and entrusted him with the charge of amusing the town and the assembly. 'Le Dépit Amoureux' and 'Les Précieuses Ridicules' were brought forward in the theatre of Béziers. In 'Le Dépit Amoureux' the incidents are better arranged than in 'L'Etourdi.' In the actions of the personages a genuine comic vein is exhibited, and their language displays much spirit and humor; but the plot is too complicated, and the *dénouement* not sufficiently probable. The plot in the 'Précieuses Ridicules' is more simple. A delicate satire on the prevailing affectation of the character of *bel esprit* and of a romantic style, on the pedantry of learned females, and affectation in language, thoughts, and dress, is the object of this comedy. It produced a general reform when it was brought forward in Paris. The spectators laughed, recognized themselves, and applauded. Louis XIV., well pleased with the performances of Molière's company, made it his own company, and gave its director a pension of 1,000 livres. 'Sganarelle, ou le Cocu Imaginaire' appeared in 1660. This piece also contains a fund of sportive humor, and keeps the spectators continually amused. Censure was not silent on its appearance, but was not listened to. 'Don Garcie de Navarre,' in imitation of the Spanish, was criticized with more justice. It is a cold attempt at a more elevated style. 'L'Ecole des Maris' the idea of which is drawn from the 'Adelphi' of Terence, contains a simple and entertaining plot and a natural *dénouement*. The theatre still resounded with the applause with which this piece was received, when 'Les Fâcheux,' projected, executed, and committed to memory by the actors within a fortnight, was performed at Vaux at the residence of Fouquet, intendant of finances, in the presence of the king and court. This comedy is almost destitute of plot, but the intention was to interest the spectators by the multiplicity of characters, the truth of the portraits, and by the elegance of the language. It is said that the king, on going away from the first performance, happening to see the Count Soyecourt, a tiresome narrator of his exploits in the chase, said to Molière, "There is an original that you have not copied." In 24 hours the scene of the hunter was inserted; and as Molière was not acquainted with the terms of the chase, he requested Soyecourt himself to explain them to him. 'L'Ecole des Femmes' (1662) met with critics, who, overlooking the

art which prevails in the management of the inferior personages, and in the natural and quick transition from one surprise to another, animated upon some negligences of style. Molière answered them by his spirited 'Critique de l'Ecole des Femmes.' The 'Impromptu de Versailles' was a reprisal occasioned by an attack of Boursault, who had written a piece against him, entitled 'Le Portrait du Peintre.' The court was much pleased in 1664 with 'La Princesse d'Elide,' a comic ballet, prepared for an entertainment given by the king. Another ballet, 'Le Mariage forcé,' is drawn from Rabelais. 'Don Juan, ou le Festin de Pierre,' excited much reprehension by the impiety of some of the expressions placed in the mouth of the profligate hero. Molière retrenched the objectionable parts in the second representation. 'L'Amour Médecin' is one of the over-hasty works which are not to be strictly criticized. It was written, studied, and represented within five days. In this Molière for the first time attacks the physicians. His great piece, 'Le Misanthrope,' was but moderately well received at first, but in the sequel was justly considered as one of the finest productions of modern comedy. It has been more admired in the closet than it has pleased on the stage—the reason Voltaire believes to be because the plot is delicate and ingenious rather than lively and interesting; because the dialogue, with all its beauty, does not always seem necessary, and therefore retards the action; and because the *dénouement*, though skillfully introduced, leaves the spectator unexcited. In 1665 appeared 'Le Médecin malgré lui,' a farce full of humor. 'Le Sicilien, ou l'Amour Peintre,' is a short piece which pleases by its grace and gallantry. But his reputation was carried to its highest summit when 'Le Tartufe' appeared. In this hypocrisy is fully unveiled, the characters are equally various and true, the dialogue is elegant and natural, the *dénouement* alone is unsatisfactory. An impious and obscene farce, entitled 'Scaramouche,' having been represented at court, the king said to the great Condé, as he was leaving the theatre in his company, "I should like to know why the people, who are so much scandalized at Molière, say nothing about 'Scaramouche.'" "The reason is," replied the prince, "that 'Scaramouche' ridicules only God and religion, about which these people care nothing, while Molière's piece ridicules themselves." In 1668 Molière published his 'Amphitryon,' a free imitation of Plautus. With the exception of a tedious scene between Jupiter and Alcmena, nothing can be more humorous. 'L'Avare' (the Miser), an imitation of the 'Aulularia' of Plautus, is, in the leading character, a little overdone; but the multitude is only to be struck by strong traits. 'George Dandin, ou le Mari confondu'; 'Monsieur de Pourceaugnac'; 'Les Fourberies de Scapin,' are rather amusing than instructive. 'Le Bourgeois Gentilhomme,' though mixed with some buffooneries, is full of power. Molière bestowed more care on his 'Femmes Savantes,' a witty satire on affected taste and pedantic learning, which at that time prevailed in the Hôtel de Rambouillet. The incidents are not all well connected; but the subject, dry as it may be in itself, is exhibited in a truly comic form. The development is admirable, and has been a hundred times imitated. The same is true of the 'Malade imaginaire,' in which the quackery and

pedantry of the physicians of the times are fully delineated. With this piece the author concluded his career. He was indisposed when it was performed, and the exertion with which he played produced convulsions, followed by a hemorrhage, and he died after the lapse of a few hours. The archbishop of Paris at first refused him burial; but the king himself insisted on it, and he was interred in the cemetery behind the chapel of St. Joseph, Rue Montmartre. In 1792 his remains were transferred to the Museum of French Monuments, whence in 1817 they were removed to Père Lachaise.

Molière is the true father of French comedy. His works may be considered as a history of the manners, fashions, and tastes of his times, and as the most faithful pictures of human life. Born with an observing mind, skilful in catching the outward marks of the passions and emotions, he took men as they were, and, with singular felicity, exhibited the most sacred recesses of their hearts, and the tone, the action, and the language of their various feelings. Of all who have ever written, Molière is the one who has best observed men without seeming to do so. His knowledge of human character seems to have come by intuition. In his domestic relations Molière was not fully happy; he who made merry on the stage with the weaknesses of other men could not guard against his own weakness. A violent passion induced him to marry the daughter of the actress Béjart, and he thereby incurred the ridicule he had so often cast on husbands of a disproportioned age. As an actor Molière was not to be surpassed in high comic parts, such as Arnolphe, Orgon, Harpagon, etc. An edition of Molière published at Paris in 1838 gave the actors' names after the *dramatis personæ*, from which we learn that Molière always played the principal comic parts himself. Among the last and best editions are those of Monval (8 vols. 1882); A. France (7 vols., 1876-91); and Desfois and Mesnard (11 vols., 1873-93). Consult biographies by Lotheissen (1880); Mahrenholtz (1881); Moland (1886); Larroumet (1886); Baluffe (1886); Mesnard (1889); Desfeuilles (1900); Schneegans (1901). Also Laereix, 'Bibliographie Moliéresque' (1875); Loiseleur, 'Points obscurs de la Vie de la Molière' (1877); Livet, 'Lexique de la Langue de Molière' (1895-7).

Molina, mō-lē'nā, **Alonso de**, Spanish missionary: b. Escalona, Spain, about 1510; d. Mexico 1584. He accompanied his parents to San Domingo, and in 1523 went to Mexico, where he learned the Aztec language and acted as interpreter to the Franciscan monks, whose order he subsequently joined and engaged in missionary work, in which he was very successful. He was superior of the province of Santo Evangelio, and his books are among the earliest printed in America. Among them are: 'Diccionario de la lengua Castellana y Mexicana' (1555); 'Arte de la lengua Mexicana' (1578); and several works in the Aztec language.

Molina, **Juan Ignacio**, hoo-ān' ēg-nā'sē-ō, Chilean historian: b. province of Talca, Chile, 24 June 1737; d. Bologna, Italy, 12 Sept. 1829. He was educated in the Jesuit College at Santiago, and entering the order after its expulsion from America in 1767, settled in Italy. After 1774 he lived at Bologna, teaching and writing. He published 'Compendium of Chilean His-

tory' (1776); 'Essay on Chilean Natural History' (1782); 'Essay on Chilean Civil History' (1787), the last-named being translated into several languages, including English, etc.

Molina, **Luis**, Jesuit theologian: b. Cuenca, in New Castile, 1535; d. Madrid 12 Oct. 1606. In order to reconcile man's free-will with the Augustinian doctrine of grace he published 'Liberi Arbitrii cum Gratia Donis, divina Præscientia, Providentia, Prædestinatione et Reprobatione Concordia' (1588). In this work he undertook to reconcile the free-will of man with the foreknowledge of God and predestination. Predestination, he asserts, is consequent on God's foreknowledge of the free determination of man's will, and does not, therefore, in any way affect the freedom of the particular actions, as a requital of which man is predestined to punishment or reward. God never fails to grant sufficient grace in order to do good and merit happiness, to those who ask it with fervor. This exposition was assailed as an antithomistic revival of the Pelagian controversy, and as setting aside the special election of the predestined by making each individual, in the exercise of his free-will, become the arbiter of his future destiny. It was opposed by the Dominicans, but adopted by the Jesuits, who were hence called Molinists. The controversy was referred to Pope Clement VIII., and after his death to Paul V., whose decree of 1607, while permitting both parties to promulgate their own opinions, prohibited them from accusing each other of heresy. Consult: Schneemann, 'Die Entstehung der thomistisch-molinistischen Kontroverse' (1879); Th. de Regnon, 'Bannesianisme et Molinisme' (1890); Gayraud, 'Thomisme et Molinisme' (1890). See JANSENISM; GRACE; PELAGIANISM.

Molinari, mō-lē-nā-rē, **Gustave de**, Belgian political economist: b. Liege, Belgium, 3 March 1819. He studied medicine and became a homœopathic physician in Brussels, but upon removing to Paris he entered journalism. His reputation as a radical compelled him to return to Belgium upon the accession of Napoleon III., and he was appointed to the chair of political economy in the Musée Royal d'Industrie Belge. In 1881 he returned to Paris and edited the 'Journal des Economistes' and later founded the journals 'L'Economiste Belge' and 'La Bourse du Travail.' Among his books are: 'Etudes économiques' (1846); 'Cours d'Economie politique' (1861); 'L'Evolution économique' (1880); 'Comment se résoudra la question sociale' (1896); etc.

Moline, mō-lēn', Ill., city in Rock Island County; on the Mississippi River, and on the Chicago, R. I. & P., the Chicago, B. & Q., and the Chicago, M. & St. P. R.R.'s; about three miles east of Rock Island, nearly opposite Davenport, Ia., and about 155 miles west of Chicago. In the part of the river between Moline and Davenport is an island from which to the shore have been built dams to secure water-power. Moline has good water-power which is utilized in developing the manufacturing industries. The cities of Davenport, Rock Island, and Moline are connected by ferries, and electric railroads, so they are almost one in commercial interests. The coal fields in the near vicinity contribute to the industrial development of the city. The chief manufactures are

MOLINO DEL REY—MOLLUSCA

wagons, carriages, agricultural machinery, steel, foundry and machine-shop products, steam engines, saw- and planing-mill products, pumps, paper, flour, and dairy products. Some of the prominent buildings are a library building, which cost (1903) \$50,000, a city hospital, several fine church and school buildings. The city library was founded in 1892 and (1904) contains about 10,000 volumes. There is a good library connected with the high school. The city owns and operates the waterworks. Pop. (1890) 12,000; (1900) 17,248.

Molino del Rey, mō-lē'nō dēl rā. See MEXICAN WAR.

Molinos, Miguel de, mē-gēl' dā mō-lē'nōs, Spanish mystic, founder of the Quietists: b. near Saragossa 21 Dec. 1640; d. Rome 29 Dec. 1696. He studied at Pamplona and Coimbra, took holy orders, went to Rome in 1669, and there published in 1675 his 'Guida spirituale,' which urged the immediate presence of God and pure love toward God as the only way to salvation and peace, which can not be attained until the soul is free from all that is material. His opponents, notably the Jesuits, held that this meant the indifference of the individual to the external world. In 1685 he was summoned before the Inquisition; two years later was found guilty of spreading dangerous doctrines. He publicly recanted all his teachings and was imprisoned until his death. Even Pope Innocent XI., a friend of Molinos, was examined by the Inquisition—but not as Pope, merely as Odescalchi, an individual. The 'Spiritual Guide' has been translated into the languages of Europe. See QUIETISM. Consult Bigelow, 'Molinos the Quietist.'

Molise, mō-lē'sē. See ABRUZZI AND MOLISE; CAMPOBASSO.

Mollah, mōl'a, or **Mullah**, mūl'a, a Turkish title, originally meaning simply 'lord,' or 'sir,' in its narrower usage a judicial rank. In Turkey there are three classes of mollahs, with jurisdiction over divisions of various importance; those in control of small towns constitute the lowest grade; they, like the second grade, hold office only for a month at a time; the first grade is made up of those having legal authority over pashaliks. The mollah ranks below the kahiaskar and mufti, but is superior to the cadi. He is versed in both ecclesiastical and civil lore. Hence, and because of its original meaning, the word is often used more loosely of Mohammedan dignitaries or scholars in Africa. See MAD MULLAH.

Mollendo, mōl-lān'dō, Peru, a seaport on the Pacific coast, in the department of Arequipa, near the mouth of the river Tambo. A railway connects it with Puno on Lake Titicaca. It is the port through which the principal imports and exports of southern Peru and Bolivia pass. Pop. over 2,000.

Molloy, J. Fitzgerald, English biographer. Among his numerous works may be cited: 'Court Life Below Stairs, or London Under the First Georges' (1882); 'Court Life Below Stairs, or London under the Last Georges' (1883); 'Life and Adventures of Peg Woffington' (1884); 'Life and Adventures of Edmond Kean' (1888); 'The Most Gorgeous Lady Blessington' (1896); 'Historical and Biograph-

ical Studies' (1897); 'The Queen's Comrade' (1901).

Mollusca, one of the great divisions or phyla of the animal kingdom, containing the oysters, clams, snails, slugs, squid and cuttlefish. The group is sharply marked off from all others and is characterized by the following features: The body is primarily bilaterally symmetrical with the mouth and anus at the two ends of the body, the alimentary tract traversing it as an axis. On the lower surface of the body is developed a muscular outgrowth, the foot; while on either side a fold of skin arises near the back and hangs down enclosing a space between it and the body and foot. The fold is the *pallium* or mantle, and the cavity is called the mantle or branchial chamber, from the fact that the true gills (*ctenidia*) arise in the angle between mantle and body and project into the space. The dorsal surface of the body usually has the power of secreting a protective shell, ordinarily strengthened by carbonate of lime. The heart, which always contains arterial blood, lies in a chamber (the *pericardium*) dorsal to the intestines, while the excretory organs, which are true nephridia, connect the pericardium with the outer world. The nervous system consists of a series of paired ganglia connected by nerve-trunks. Of these ganglia the most constant are (1) the cerebral, at the anterior end, above the oesophagus; (2) the pedal in the foot; (3) the parietal on the sides of the body; and (4) the visceral near the hind end of the body ventral to the intestine. All of the ten thousand species of living mollusks are built upon this plan.

Details of Structure.—Mantle and Foot.—Typically the mantle is a paired structure, but in most groups the two halves unite in front and behind. This has its effect upon the shell, since where the lobes are separate, there are two halves or valves to the shell, but where united there is but a single (univalve) shell. Sometimes this univalve shell is a straight cone, but, while conical, it is usually coiled in a spiral, a part of the body extending toward the apex of the cone. As the animal increases in size the shells also increase in thickness and extent, the successive additions being usually recognizable on the external surface by lines of growth which run parallel to the free edge of the shell. When the edge of the mantle is provided with projections, lobes, etc., these cause ridges or protuberances on the surface of the shell. When the mantle is colored (striped or spotted), the color-pattern is reproduced in the shell, since pigment from the mantle is deposited along with the carbonate of lime. There is also a structure to the shell which needs mention. On the outside is usually a thin organic cuticle and beneath this two layers of carbonate of lime. Sometimes the inner of these layers consists of thin lamellæ parallel to the surface, the free edges of which produce diffraction spectra and thus give the inside of the shell an iridescent appearance—mother-of-pearl. See PEARL.

In the bivalve shell (see BIVALVES) an elastic hinge ligament connects the two valves and causes them to open. The valves are closed by muscles (adductors), one or two in number, which extend across the body, from valve to valve. In the univalves there is always a muscle attached to the inside of the spiral, by the contraction of which the animal is retracted into the shell, the foot being the last part to disap-

MOLLUSCA.

1. Pond Snail (*Lymnaea stagnalis*). 2. Slug (*Arion ater*). 3. Green Sea-slug (*Elysia viridis*). 4. Freshwater Snail (*Hydrobia ulvae*).

MOLLUSCA

pear. In many groups the posterior dorsal part of the foot bears a horny or calcareous plate, the *operculum*, which closes the aperture of the shell like a door when the animal is retracted. On the other hand the shell is frequently greatly reduced and may become internal, as in the slugs and squid; or it may be entirely absent in the adult, as in the so-called naked mollusks (nudibranchs) although it is formed in the young and later lost.

Foot.—The foot, which projects from the mid-ventral surface of the body, shows great modifications, but is rarely lacking. Usually it forms a broad creeping disk on which the animal glides about, but in the *Scaphopoda*, as in most *acephala*, it is flattened from side to side and forms an efficient digging organ. In the *cephalopods* it becomes developed in part into the tube (siphon) connecting the mantle-cavity with the exterior; in part into the tentacles surrounding the head.

Digestive Organs.—The alimentary canal is typically a straight tube, but in most forms it becomes convoluted to increase the amount of digestive surface, while not infrequently it is so flexed on itself that mouth and vent, instead of being at opposite ends of the body, are in close proximity to each other. In all except the *acephala* the region of the mouth contains a peculiar structure, variously known as the lingual ribbon, radula, or odontophore. This consists of a strong band, having upon its upper surface numbers of rows of hard horny teeth—in fact, a flexible file; and of muscles adapted to draw it back and forth over any object to which the mouth may be applied. In this way the snails rasp away vegetation, or, as in the case of shells of other mollusks, are perforated in order that the soft parts may be reached and devoured. In the cone-shells a poison-gland is connected with the lingual ribbon. Wear at one end of the ribbon is made good by constant growth at the other end. Behind the gullet is a large sac-like stomach, and closely connected with it are the ducts of the voluminous liver. The intestine is long, without enlargements, and in many *acephala* is remarkable for passing through the heart.

Circulation.—The heart lies dorsal to the digestive tract enclosed in a special sac, the pericardium, which is to be regarded as the sole representative of the true body-cavity or coelom (see EMBRYOLOGY). In the heart two parts are always to be distinguished, a muscular ventricle which forces the blood through the arteries to all parts of the body, and one or two auricles which receive the blood as it comes from the gills and force it into the ventricle. As will be seen, the heart thus receives only oxidized or arterial blood. With the loss of the gill of one side the corresponding auricle disappears. When four gills are present as in the nautilus, there are four auricles. In the *cephalopods* branchial hearts, which force the blood through the gills, occur. At one time it was thought that some of the blood-vessels opened to the exterior, but this has been shown to be a mistake. The blood is usually yellowish or colorless, but occasionally is red, the color being due to the plasma and not to the contained corpuscles which resemble the leucocytes of the blood of man.

Gills.—As was mentioned above, there may be two kind of gills, the ctenidia and the secondary or adaptive gills, the latter occurring

only in the *gasteropoda*. The ctenidia, which always occur in the angle between mantle and body-wall, consist, typically, of a series of filaments with blood-vessels in the interior, the filaments and the ridge from which they spring resembling somewhat the teeth and back of a comb, whence the name (Greek *κτενός*, comb). The ctenidia are typically paired, but in the nautilus there are two pairs, while in many *gasteropods* one ctenidium (that of the left side) is lost. The adaptive gills occur on various parts of the body, usually upon the back. In most land snails (*Pulmonata*) the gills entirely disappear and an air-breathing organ, the lung, is developed on the walls of the mantle cavity, the opening to it being usually on the right side of the body.

Nerves.—The nervous system was described above. It is only necessary to say that the ganglia may coalesce into a smaller number. There are usually present three pairs of sense organs, a pair of eyes connected with the cerebrum, a pair of so-called ears (really organs of equilibration) connected with the pedal ganglia, and a pair of organs of smell (osphradia) with the visceral ganglia. Of these the eyes are the least constant. In some cases they are replaced by numerous other eyes developed upon the back or upon the edges of the mantle.

Viscera.—The excretory organs are true nephridia, that is, coiled tubes opening at one end into the coelom (pericardium), and at the other to the external world. They are also known as the organs of Bojanus. The reproductive organs are large. Usually the sexes are separate, but some, like the land-snails, are hermaphroditic. In no case is an asexual reproduction (fission, budding, etc.) known. A few bring forth living young. In many species a metamorphosis occurs during the development. In these a peculiar larva, known as the *veliger*, hatches from the egg, a larva which is closely similar to the "trochophore" larva of the annelids, a resemblance which points to a relationship between the two groups. The veliger receives its name from the "velum," a circle of cilia upon the dorsal side of the head above and in front of the mouth, by means of which the larva swims.

Classification.—The mollusks are divided into five classes, *Amphincura*, *Scaphopoda*, *Gasteropoda* and *Cephalopoda*.

Amphincura.—This, the most primitive group of mollusks contains the chitons (*Placophora*) and the *Solenogastres*, in both of which the body is markedly bilaterally symmetrical, while the nervous system is of a very low type. The chitons (q.v.) are flattened and covered with eight transverse plates of shell. The *Solenogastres* are worm-like shell-less forms of the deeper seas.

Pelecypoda or *Acephala*.—These are the mollusks which have the shell in two parts or "valves," no head, and the filaments of the gills more or less completely united into a couple of leaves (lamellæ) on either side of the body. See BIVALVES.

Scaphopoda.—This class includes a few marine forms of small size known as tooth-shells, from having shells shaped somewhat like an elephant's tusk, and open at both ends. See DENTALIA.

Gasteropoda.—In these, the so-called snails,

MOLLUSCOIDA — MOLTING

the foot is usually a broad creeping disk and the head is well developed. See GASTEROPODA.

Cephalopoda.—In these the head is well marked off from the body, and the mantles of the two sides are united so that a single mantle cavity results, which is open to the exterior in front. See CEPHALOPODA.

Formerly two other orders of mollusks were recognized, the *Heteropoda* and the *Pteropoda*, but the heteropods are now known to be prosobranchs, the pteropods to be opisthobranchs, both being modified for a life on the surface of the sea.

Bibliography.—Hescheler, in Lang's 'Comparative Anatomy' (2d ed. 1896); Woodward, 'Manual of the Mollusca' (4th ed. 1880); Cooke, 'The Mollusca,' in Cambridge Natural History, Vol. III. (1895); Kingsley, 'Standard Natural History,' Vol. I. (1885). Tryon and Pilsbury began in 1896 a work in which they proposed to describe and figure every known species of mollusk. For mollusks of the United States consult writings of Gould, Binney, Morse, Tryon, Dall, Verrill, Bush, Stearns, etc.

Molluscoïda, a group of animals formerly recognized by some naturalists, which included the *Brachiopoda*, the *Polyzoa*, and the *Tunicata*. On account of misinterpretations of structure these were once included in the *Mollusca*, and when removed from that group the name Molluscoïda was given. Next the *Tunicata* were removed to the *Chordata*, and later the group *Molluscoïda* was abandoned.

Mollwitz, möl-vīts, Prussia, a village of Silesia, 25 miles southeast of Breslau, which gives its name to the battle fought to the east of the village 10 April 1741 between the Prussians under Frederick the Great and the Austrians under Marshal Neipperg. About 20,000 troops were engaged on each side, and the Austrians gained the first advantage in putting the Prussian cavalry to flight. The Prussian infantry, however, commanded by Marshal Schwerin, stood their ground for five hours and won the battle. The Prussians lost 5,500 men and the Austrians 5,340. The victory led to an alliance between France and Prussia, and to Austria ceding the province of Silesia to Frederick the following year, to dissolve the alliance.

Molly Maguires, an Irish secret society formed in 1843 to intimidate bailiffs or process-servers distraining for rent, or others impounding the cattle of those who were unable or unwilling to pay rent. A similar society was formed in 1877 in the mining districts of Pennsylvania. The members sought to effect their purpose by intimidation, carried in some cases to murder. Several were arrested, tried and executed, and the society was disbanded.

Mollymauk, a bird. See FULMAR.

Molmenti, Pompeo Gherardo, pòm-pā'ô gā-rār'dô mōl-mān'tê, Italian author: b. Venice, Italy, 1852. He studied law and practised in Venice, but abandoned it to become professor of Italian literature at the Liceo Marco Foscarini. His literary work comprises critical essays, history of literature and art and also fiction, among which are: 'Impressioni letterarie' (1873); 'Storia di Venezia nella vita privata' (1880); 'Studi e ricerche di

storia e d'arte' (1892); 'Antonio Fogazzaro' (1900).

Moloch, mō'lōk, or **Molech** (Heb. *mōlekh*, king), called in Scripture an idol of the Ammonites, the fire-god of Phœnicia. His image was an iron statue, with a human body, the head of an ox, and extended arms. The statue is said to have been heated by a fire placed in the lower part, and children were placed as offerings in the arms. His cult was introduced into Judah, and Solomon built a temple to him on the Mount of Olives.

Moloch, a small Australian desert-lizard of the family Agamidæ, whose skin is covered with irregular plates bearing thorny pointed tubercles, spines and prickles all over the body, but especially well developed behind the head. Altogether its appearance is alarming, reminding one of a miniature of some armored saurian of the Mesozoic era. It is, however, quite harmless, subsists mainly on ants, and its formidable aspect, as in the case of the similar horned toad (q.v.), is wholly defensive in two ways—first as a real defense against being too readily seized and swallowed by enemies, especially serpents; and second, by exposing a very large and highly absorbent surface to whatever moisture the air may contain. Consult Saville-Kent, 'Naturalist in Australia' (1897).

Molokai, mō-lō-kī', Hawaii, an island of the group about 40 miles long and seven to nine miles broad. It is noted for the government settlement for lepers where Father Damien spent his noble life of self-sacrifice. See HAWAII; LEPROSY.

Molokan, mōl-ō-kān', plural **Molokani**, mōl-ō-kā'nê, one of a sect in Russia who follow the laws of Moses regarding meat, forbid the use of images or the sign of the cross, and consider war unlawful. They derive their name from the quantity of milk-food eaten by them.

Molting, the change of skin or feathers, which occurs annually or periodically in insects, etc., and especially in birds. It is a process often perilous to the animal, being not infrequently attended by loss of life. In mammals it may be gradual, as when the pelage or hair is changed. Other examples are the annual shedding of the antlers of deer in spring, or the autumnal dropping of the horns of the prong-horn antelope.

Molting in Amphibia and Reptiles.—Here the entire skin is cast. The newt in early spring sheds its skin by detaching it from around the jaws, then pulling it back over the head, and the limbs. The toad in molting causes the old skin to split along the back, it then pulls it off as one would a coat by working the muscles of the back; it is detached by movements of the head from around the lips, face, eyes and mouth; the skin is more readily pulled off from the legs to the tips of the toes. The skin, as in salamanders, is a thin film, and it comes off in four pieces. Immediately after molting the creature is shy and active. Sharp describes the molting of the common striped snake (*Eutamias sirtalis*). One came out of the water in a vivarium, gliding on to the grassy sod: it then shrugged itself for a moment, when the skin parted at the jaws. The skin on the head, how-

MOLTKE — MOLUCCAS

ever, remained fixed, so that when the creature crawled out the old skin was inside out. The operation took less than one minute.

Molting in Birds.—The feathers may all be cast or only a part of them. Young birds molt several times before adult age. The passerine birds undergo a complete ecdysis after the breeding season is over (post-nuptial), when the worn-out plumage is restored; and they may also before the breeding time pass through an incomplete molt, when their wedding dress is put on. The process is so gradual as a rule that few birds, except the ducks, etc., are unable to fly, or go unprotected. The height of the molting season is in August, though the feathers drop out in nearly every month of the year. The complete molt is undergone in from a month to six weeks' time. Besides their feathers the pelican sheds a horny projection on the ridge of the bill, and the puffin and certain allied species shed the horny sheath of the bill, etc. For further information see **PLUMAGE**.

Molting in Crustacea and Insects.—The horsefoot crab (q.v.) frequently sheds, its skin opening around the edge of the head; this is also the case with the fresh-water crustacean *Apus*. In the crayfish and lobster the skin splits open between the thorax and abdomen, and the animal draws itself out of the transverse rent thus formed. The skin is cast entire, while the chitinous lining of the mouth, throat, fore stomach and of the rectum is also shed. The process of exuviation in the crayfish has long been known to be aided by the outgrowth of little delicate papillæ called casting-hairs; these serve to loosen the old integument; recently Packard has discovered similar papillæ on the new or under-skin (hypodermis) of the lobster, and similar undergrowths aid the serpent in shedding its scaly epidermis.

In insects molting is frequent, especially in the larva stage, most caterpillars molting four or five times. The body moves convulsively and splits along the back, at the same time, casting hairs being usually absent, a molting fluid is poured out which serves to detach the old skin. The head is molted separately, the shell falling off by itself, then the body-skin is shuffled off, being pulled back toward the tail, and with the outer integuments all the lining of the digestive canal is shed (except that of the stomach and beginning of the intestine), and the lining of the spiracles, as well as the cuticle of all the hairs, and the spines.

Consult: Newton, 'Dictionary of Birds' (1893-6); Dwight, 'The Sequence of Plumage and Molts of the Passerine Birds' (Annals New York Academy of Sciences, Vol. XIII., 1900); Packard, 'Text-book of Entomology' (1898).

Moltke, Helmuth Karl Bernhard, hēl'moot kār'l bērn'hārt mōlt'kē, Count von, German soldier: b. Parchim, Mecklenburg-Schwerin, 26 Oct. 1800; d. Berlin 24 April 1891. In 1812 he was admitted as a cadet of the Royal Military Academy, Copenhagen. In 1818 he passed his examination for a commission as first of the candidates. Seeing little prospect of advancement, he entered the Prussian service in 1822, becoming 2d lieutenant. He then studied three years at the staff college, Berlin; in 1832 was appointed to the general staff; in 1833 became lieutenant, and in 1835 captain. He had already visited Italy, and he now went to Turkey,

where he became military adviser of the sultan Mahmud. He took part in the Turkish expedition against Ibrahim Pasha in 1839, but his advice was disregarded, and he returned to Constantinople, and on Mahmud's death to Berlin, where he was again employed on the general staff. His experiences in Turkey led him to publish two valuable works: 'The Russo-Turkish Campaign of 1828-29 in European Turkey' (1835), and 'Letters on Affairs in Turkey in the Years 1835-39' (1841). After rising through the various army grades he was placed permanently at the head of the general staff of the army in 1850 with the rank of lieutenant-general. His labors in reorganizing the Prussian army were of immense value to Prussia and to Germany, and had a great influence on the general history of Europe. The defeat of Denmark in 1864 was largely owing to his genius for military operations, and the result of the greater war of 1866 against Austria is equally to be attributed to him. Then followed the Franco-German war of 1870, for which Moltke was entirely prepared, having foreseen for some years what was likely to happen, and having immediately after the Austrian war prepared for a campaign against France. The brilliant success which followed was in very large measure a personal triumph for Moltke. He passed his 70th birthday at Versailles, and was raised by the king of Prussia to the rank of count on receipt of news of the capitulation of Metz. On his return to Berlin he was made a field-marshal, received from parliament a grant of \$225,000, was appointed for life a member of the Prussian upper house, and other honors were conferred upon him. He held the post of chief of the staff till after the accession of Emperor William II. in 1888, when he resigned on account of advanced age, but was made president of national defense. His 90th birthday was made the occasion of public demonstrations in his honor all over Germany. He was a man of great modesty and simplicity, kind and considerate to subordinates, and devoted, above all things, to duty. His military genius was compounded of boldness in design with minute care in execution. From his reticence it was wittily said that he was silent in seven languages. Besides the works already mentioned, Moltke wrote 'Letters' (1892), and the works of the general staff on the Italian war of 1866, and the Franco-German war of 1870-1 are largely from his pen. Consult the 'Essays, Speeches, and Memoirs' which appeared in 1893; also Pinkerton's English translation (1879) of Müller's 'Life.'

Moluccas, mō-lūk'az, or **Spice Islands**, East Indies, three groups of islands in the Malayan or Indian Archipelago (q.v.), between Celebes and New Guinea, and the Philippines and Timor Archipelago. (1) The Ternate Islands, or Moluccas proper, consisting of Ternate, Gilolo, Batshian, Obi, Morti islands, and numerous islets. (2) The Amboyna Islands, including, besides Amboyna, which is the chief seat of government for the whole Moluccas, the islands of Ceram, Booroo, and other smaller islands. (3) The Banda Islands. They are nearly all mountainous, and some of them have peaks rising to a height of 7,000 feet or 8,000 feet, mostly volcanic; there are still several active volcanoes in the group, and earthquakes are

MOLYBDENITE—MOMENT

of frequent occurrence. Cloves, nutmegs, mace and sago are exported to Europe; and birds'-nests, trepang, and shark-fins to China. The Moluccas, discovered in 1512, were alternately in the possession of the Spaniards, Portuguese, and Dutch. They were taken from the latter by the British in 1796, and in 1810, but in 1814 again given up to Holland, in whose possession they still remain. The general language on the coast is the Malay.

Molybdenite, a native sulphid of molybdenum, having the formula MoS_2 , and crystallizing in tabular or hexagonal forms, probably belonging to the hexagonal system. It has a marked basal cleavage, and resembles some forms of mica. It is leaden-gray in color, with a metallic lustre, a specific gravity of about 4.7, and a hardness of from 1.0 to 1.5. It commonly occurs in granite, gneiss and other crystalline rocks. In the United States it is found in the New England States, and in New York, Pennsylvania, Colorado, and California. It also occurs in Canada, and crystals from one to two inches in diameter have been discovered in Renfrew County, Ontario.

Molybdenum, a metallic element whose compounds are somewhat widely diffused, though they rarely occur in any considerable quantity in any one place. Molybdenum is never found in the metallic state, but it occurs in a number of minerals, the most important of which is molybdenite (q.v.), the native sulphid. Molybdenite resembles galena in some respects, and owes its name to this fact, the word "molybdenite" being based upon the Latin name for galena. It was first clearly distinguished from galena by Scheele, in 1778, and in 1782 Hjelms obtained the element molybdenum in the metallic form. Molybdenum may be prepared by reducing the oxid by hydrogen, carbon, or potassium cyanide, as well as by various other methods. It is usually described as a silvery white metal, hard, but somewhat malleable. It has a specific gravity of about 8.6, and a specific heat of about 0.0659. Its melting point is higher than that of platinum. Molybdenum is not affected by air or moisture at ordinary temperatures, but oxidizes slowly when heated in air, and at high temperatures it burns, whether heated in air or in steam. Chemically, molybdenum behaves both as a metal and as a non-metal. It has the chemical symbol Mo , and an atomic weight of 96 if $\text{O} = 16$, or 95.3 if $\text{H} = 1$. It forms several oxids, of which the trioxid, MoO_3 , is the most important. This is the oxid that is formed when the metal is burned in air, and it may also be prepared by roasting the native sulphid in air. The trioxid occurs native in small quantities, as "molybdenum ochre," or "molybdite." Metallic molybdenum combines directly with chlorine to form MoCl_3 , and with bromine to form MoBr_3 ; but it does not combine directly with iodine. Unlike the other metals, molybdenum does not readily replace the hydrogen of acids to form definite salts, but its oxids dissolve in acids with the formation of compounds which have, as yet, been but little studied. The trioxid combines with water to form substances of the nature of acids, and which are, in fact, called "molybdic acids." These further combine with metallic bases to form an extensive series of compounds known as "molybdates." The compounds of molyb-

denum are of interest only to the chemist, as they have no extensive use in the arts. Ammonium molybdate, however, is used in the laboratory as a reagent for the detection of phosphoric acid, a yellow precipitate being thrown down when a nitric acid solution of ammonium molybdate is added to a solution containing a phosphate.

Molyneux, mól't-nooks, William, Irish philosopher: b. Dublin 17 April 1656; d. there 11 Oct. 1698. He was graduated from Trinity College, Dublin, entered the Middle Temple, London, became a student of applied mathematics and philosophy, was elected F. R. S. in 1685, and was elected to Parliament for Dublin University in 1692 and 1695. Besides his works on optics and philosophy, he wrote 'The Case of Ireland's Being Bound by Acts of Parliament in England' (1698).

Mombasa, möm-bä'sä, Africa, an island and town on the east coast, the town, the chief seaport and the seat of administration of British East Africa, being on the north side of the island, which is 3 miles long by $2\frac{1}{2}$ miles wide, close to the coast, 150 miles north of Zanzibar, lat. $4^\circ 3'$ S. Here are an old Portuguese fort, a new European hospital, and the offices and workshops of the British East Africa Company. A short railway connects Mombasa with Kilindi, the naval coaling depot, on the other side of the island, where is the residence of the chief administrator of the company. Mombasa is also the terminus of a railway connecting with the Victoria Nyanza. Trade in (imports) piece-goods, brass and iron wire, beads, rice; and in (exports) ivory, gum, copal, copra, ochella weed, maize, and grain; carried on by natives of British India. Pop. (1901) 24,700. Island and port are mentioned as early as 1331. It was visited by Vasco de Gama in 1497, held by the Portuguese from 1520 to 1668, and by the British from 1824 to 1826, but the British refused to accept cession of it. Soon after the Sultan of Muscat obtained possession of the town, which at his death fell to his son, the Sultan of Zanzibar. In 1888 the Imperial British East Africa Company received governing rights over it from the Sultan of Zanzibar, and since then it has passed definitely over to the possession of Britain, along with the huge territory on the mainland allotted to that country.

Mombert, möm'bért, Jacob Isidor, American Episcopal clergyman and author: b. Cassel, Germany, 6 Nov. 1829. He was educated at Leipsic and Heidelberg, took orders in the English Church and in 1857 removed to Canada. He was assistant rector in Trinity Church, Quebec, 1857-59; rector of St. James, Lancaster, Pa., 1859-70, of St. John's, Dresden, 1870-6, of Christ Church, Jersey City, 1877-9, and of St. John's, Passaic, N. J., 1879-82. Since the last named date he has given his attention to literature. His writings include: 'Great Lives' (1886); 'Charles the Great' (1888); 'Handbook of English Versions of the Bible' (1890); 'Short History of the Crusades' (1890); 'Raphael's Sistine Madonna' (1895); etc.

Moment of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The moment of a force about a point is the product of its amount into its perpendic-

MOMENT OF INERTIA—MOMMSEN

ular distance from the point. The tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force in causing rotation is measured by the moment Wl —where W is the weight of the pendulum, and l is the distance of the line of action of the force W from the centre of rotation C , or the distance of the centre of mass G from the vertical line through C .

The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any given body rotating with angular speed ω about an axis, we first imagine the body broken up into a great many small portions of masses m_1, m_2, m_3 , etc., at distances r_1, r_2, r_3 , etc., from the axis, multiply the momentum (mvr) of each mass by its distance, and then take the sum of all these products. The angular speed ω being the same in every expression, the moment of momentum takes the form $\omega (m_1 r_1^2 + m_2 r_2^2 + \text{etc.})$, which it is usual to write in the symbolic form $\omega \Sigma mr^2$. The quantity Σmr^2 , which is the sum of the products of each mass into the square of its distance from the axis, is called the moment of inertia about that axis. It is the factor in the moment of momentum, which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass, and acceleration as the rate of change of that momentum.

If the mass of every small portion of matter in a body be multiplied by the square of its perpendicular distance from a straight line, the sum of all such products is called the moment of inertia of the body about the line regarded as an axis. The radius of gyration of the body is the distance from the axis at which all the matter of the body might be concentrated without altering the moment of inertia. Thus, if I is the moment of inertia of the body, M its whole mass, and k its radius of gyration, $I = Mk^2$. We see that the moment of inertia of a body about a line is found by adding a great number of products of small masses and squares of distances; if the body can be defined mathematically as to shape, size, and density, finding its moment of inertia is a problem of the integral calculus.

Moment of Inertia. See MECHANICS.

Momentum, in mechanics and physics, the product of the mass and velocity of a body. Like velocity, momentum is usually regarded as having a definite direction, as well as a definite numerical magnitude. The momentum generated by a constant force acting upon a material particle for a definite length of time, is numerically equal to the product of the force by the time during which it acts. See MECHANICS.

MommSEN, mōm'zēn (Christian Matthias) Theodor, German scholar: b. Garding, Schleswig, 30 Nov. 1817; d. Charlottenburg, near Berlin, Prussia, 1 Nov. 1903. He was a student of jurisprudence and philology at the University of Kiel; took his Ph.D. in 1842; published with his brother Tycho and his friend Storm a volume of verse which was heartily condemned by the reviewers (1843); began more successfully his career as historian with the treatise 'De Collegiis et Sodalitatibus Romanorum' (1843), commended for its thoroughness and a clarity of style new to German works of this kind; and in 1844-7 was in France and Italy under commission of the Berlin Academy, collating manuscripts and inscriptions. On his return he edited for a short while the *Schleswig-Holsteinische Zeitung*, and in 1848 became professor of Roman law at Leipsic. He entered politics as an advocate of constitutional progress, was arrested for inciting to revolt, and though acquitted by the courts was deprived of his chair. From that time he was an eager if not invariably judicious disputant in many political controversies. He was appointed to the professorship of Roman law at Zürich in 1852, at Breslau in 1854; and from 1858 until his death was professor of ancient history in the University of Berlin. In 1873 he was elected perpetual secretary of the Berlin Academy; but this post he resigned in 1895. For ten years (1873-82) he was a Liberal member of the lower house of the Prussian parliament, where he bitterly attacked Bismarck's domestic policy. In an election speech at Charlottenburg in 1882 he characterized the Iron Chancellor's tariff measures as a "Politik von Schwindel." Such boldness might not go unrebuked, and MommSEN was brought to trial for slander. His acquittal by both a lower and an appeals court was one of his great triumphs. He sternly advised the Teuton element in Austria in the struggle with the Czechs; made some caustic observations in a 'North American Review' article on British treatment of minor nations; to the last was quite as belligerent as ever.

But he was only incidentally the politician. He was pre-eminently what Freeman called "the greatest scholar of our times, well nigh the greatest scholar of all times" ('Methods of Historical Study'). He was distinguished as an epigraphist, historian, jurist, numismatist, and philologist. None in the 19th century, which he almost spanned, has, as Freeman goes on to say, "taken in so wide a range of subjects, all brought with the happiest effect to bear upon and to support one another." To the educated reader at large he will probably continue to be best known for his 'Römische Geschichte' (3 vols. 1854-6; 8th ed. 1889), to the battle of Thapsus; together with Vol. V. on the provinces from Cæsar to Diocletian (1885). Volume IV., on imperial Rome, has not yet (1903) appeared. There are English renderings by W. P. Dickson (Vols. I.-III. 1862-6; Vol. V. 1886). This work opened a new epoch in historiography. Though written with great spontaneity, without even references to original sources, it was based on unrivaled knowledge, and presented its material with extraordinary clearness and at times with brilliancy. It is of course somewhat dogmatic, is certainly unfair to Cicero, and has been blamed, by Freeman among several, for undue

MOMORDICA—MONACHISM

regard of mere power and success. To scholars Mommsen is above all the editor of the great 'Corpus Inscriptionum Latinarum' (1863 et seq.; Vols. I, III, VIII, IX., by himself; others under his immediate supervision). Every inscription of this monumental collection was taken down from the original. The errors and falsities of predecessors were cleared away, and a scientific foundation was supplied for the study of Roman antiquities. Mommsen's preface to the series is said to be thought by critics one of the finest specimens of Latin prose written in modern times. For a complete list of his writings, Zangemeister's 'Mommsen als Schriftsteller' (1887) should be consulted. Mention may be made of 'Römisches Münzwesen' (1850), 'Römische Chronologie' (1859) and 'Römisches Staatsrecht' (1871-88). All are standard, but the last, particularly, by the breadth and completeness of his exposition of the Roman constitution, places Mommsen among the foremost of constitutional writers. He also edited the 'Res Gestæ Divi Augusti ex Monumentis Ancyranis et Apolliniensibus' (1865; new ed. 1883); the 'Digesta' in Vol. I. of the 'Corpus Juris Civilis,' 6th ed. 1893), and many other publications. Appreciation of his achievements was shown by the fact that his library, when partially burned in 1880, was replenished by gifts from foreign scholars.

Momordica, a genus of plants of the gourd family, remarkable for their strangely marked seeds. Two or three species are cultivated in the United States as ornamental plants, one of which (*M. charantia*) produces a food for the Chinese in the pulp about the sculptured seeds; another Oriental food, the golokoka of India, is the fruit of *M. cochinchinensis*; and the balsam-apple (*M. balsamina*) which furnishes a healing principle which is infused in oil to form a liniment highly esteemed in the Levant.

Momotombo, mō-mō-tōm'bō, Nicaragua, an active volcano rising from the northwestern shore of Lake Managua. It is 6,121 feet high; its last notable eruption was in 1852.

Mompos, mōm-pōs', or **Mompox**, mōm'-pōh, Colombia, a town of the province of Bolivar on an island formed by the Magdalena. The streets, which extend parallel to the river, are well laid out, but the houses are badly built. Mompox is a depot of foreign goods destined for consumption in the valley of the Magdalena; but the changes in the river's course rendering it unnavigable have seriously injured its prosperity. Pop. 10,000.

Mo'mus, in Greek mythology, the god of satire and mirth. He is generally represented raising a mask from his face and holding a small figure in his hand. His mother was Nyx, the goddess of night.

Mona, mō'na, (1) a West Indian islet belonging to the United States since 1898. It has 42 miles east of Porto Rico, in the middle of Mona Passage, to which it gives its name; area, nearly 10,000 acres. It is a coral formation. The general level is about 60 feet above the sea-level, with a range of hills on the east side of the island, running from north to south, the highest peak of which is 175 feet above the wa-

ter. The island is well watered and well drained, has a luxuriant vegetation and all kinds of tropical fruits grow in profusion. It is the nesting place of thousands of green turtles, and the waters teem with the finest varieties of fish. The only residents belong to the lighthouse establishment; (2) the ancient name mentioned by Tacitus for the island of Anglesey (q.v.), Wales, also applied by other ancient writers to the Isle of Man.

Mona, a West African monkey (*Cercopithecus mona*), remarkable for its brilliant coloration, the head being olive-yellow, with a black stripe on the forehead; yellowish whiskers and a purple face. The back is chestnut-brown, and there is a white spot on each side near the root of the tail, which is black. It is constantly seen in menageries.

Monachism, or **Monasticism**, is a state of life in retirement from the world adopted for motives of religion. It is not peculiar to Christianity, for in many religions, as that of Israel, and in those of India, China and Tibet, the same motive has led men to withdraw themselves wholly or in part from converse with worldly society and to seek in seclusion and retirement opportunity to lead a purer or higher life. The Nazarites, the Rechabites, the Essenes, the Therapeutæ were separatists from society in a greater or less degree, and in this respect were the precursors of the ascetæ of the earliest Christian age and of the hermits or anachoretæ and the cœnobites of the third and fourth centuries.

In the middle of the 3d century, during the persecution of the Christians by Decius, Paul of Thebes in Egypt (St. Paul the first hermit), withdrew to a wilderness, and during the remainder of his long life lived in absolute solitude in a cavern of a mountain, deriving his food and his vesture from a neighboring grove of palm trees. Many others fleeing from persecution or from the contagion of a profoundly corrupt society, flocked to the wildernesses of the Nile country; among them was Antony (Saint Antony), who after many years of the strictly solitary life of an anachorete was in a manner compelled by circumstances to adopt the cœnobia rule. He was by choice an anachorete like St. Paul the Hermit, but the fame of his virtues and his miracles brought to his cell in a remote wilderness many who desired to devote themselves to the service of God under such a master; and as he could not refuse their prayer he became, in fact if not in name, the Father or Abbot of a pretty numerous cœnobia; hence he is called the Father of Monachism, that is, of the life-in-common of those who retire from the world for reasons of religion; they retain the title of monk, *monachus* (a solitary), though since St. Antony's day they are no longer solitaries but cœnobites.

Antony's cœnobites occupied each a separate hut or a separate grotto; but St. Pachomius, a contemporary of Antony, introduced a further development of the community life. The cells or huts were now to hold three brethren; meals were eaten in common; the labor of the monks was regulated; the brethren were graded according to their spiritual proficiency; the community was presided over by an abbot, with inferior officers; in addition to the primitive industries of petty agriculture, basket-making

PROFESSOR THEODOR MOMMSEN.

MONACHISM

and mat-weaving, the monks practised the trade of the smith, of the tanner, etc.; there were daily assemblies of the community for prayer and conference. When St. Pachomius died, about the middle of the 4th century, 7,000 monks were subject to his rule.

From Egypt monachism soon spread into Syria, Palestine, Mesopotamia, Asia Minor and Armenia.

The introduction of monachism in the Western countries of the Roman Empire dates from a little after the middle of the 4th century when a few small communities of monks, under the Pachomian rule, were founded at Rome and in Northern Italy. Later, when the rule of St. Basil had been translated into Latin, communities of Basilian monks sprang up in Southern Italy. Saints Jerome, Augustine and Ambrose were zealous promoters of monachism in Italy and Africa. St. Martin of Tours in Gaul; when St. Martin died (397) his body was followed to the tomb by 2,000 monks.

Whether under the Pachomian or the Basilian rule or under modifications of these, monastic establishments multiplied rapidly in the West. But the disorder which attended the decline of the Western Empire and the barbarian invasions, had its effects upon monachism, and the monastery exhibited the same anarchy as did civil society.

Early in the 6th century Benedict of Nursia, who had already led for three years the life of a strict recluse in a cave at Subiaco, about forty miles distant from Rome, was chosen by the monks of a monastery in the same place as their abbot; but very soon, his new subjects having deposed him, he returned to his solitude and commenced that reform of Latin monachism which made his name illustrious. He gave to his monks a rule which, variously amended and modified, has been the law of the monastic life of Western Europe ever since. In its preamble Benedict recognizes two and only two legitimate classes of monks—*cenobites* and *anachoretas*—those who lead the life in common and those who live in solitude—usually now called *hermits*.

Two other classes he names, but only for condemnation, namely, *sarabaites*—professing monks who live two or three together without any superior or any fixed rule; and *gyrovagi* or *circulatores*, tramps, wandering beggars who wear the cloak of a religious profession. To do away with these scandals of the monastic life, Benedict's rule requires that the postulant for admission to a monastery shall take in addition to the usual monastic vows of poverty, chastity and obedience, a further vow that he will remain all his days in the community in which he makes his profession, and never be absent from the monastery save by leave of his superior.

Besides monasteries for men Benedict instituted also monasteries of women, and the first abbess of a community of Benedictine nuns was his sister Scholastica.

The Benedictine order was for a long time a powerful agency in the civilization and christianization of the barbarian nations of Europe. Wherever a Benedictine foundation was made there the face of the country was quickly changed: forests were cleared, marshes drained, the arts of husbandry developed, peace and civil order maintained, science and learning fostered, schools, hospitals and refuges established.

Monastic institutions founded in Britain, France, Switzerland, Italy and Germany by Celtic monks prior to Benedict's reform conformed to the Benedictine rule. The Carthusian order, founded in the end of the 11th century, was a reversion to the anachoretic type of monachism—the solitary or eremitical instead of the *cenobitic* life. In the same century arose the order of the Camaldoli, another order of hermits.

The beginning of the 12th century saw the rise of that singular development of monachism, the knightly orders, the members of which besides the usual three vows of the monk took a fourth vow, of making war on the infidels for the defense of Christendom. The Knights Hospitallers were originally a religious society bound by vow to harbor in health and in disease pilgrims visiting the holy places in Jerusalem; their house in the holy city was a "hospital" or guest-house. The full title of the Knights Templars is "*pauperes commilitones Christi templique Salomonis*"—poor knights-companions of Christ and of Solomon's temple. Another military order contemporary with these was the Teutonic order. History records the titles of over ninety military orders or of bodies styling themselves so.

The chronic state of war between Christendom and the Mohammedan power led to the institution of the order of Trinitarians and that of Our Lady of Mercy. The mission of these orders was the redemption out of slavery among the Mohammedans of Christian captives. Bearing the alms and gifts contributed by the charity of Europe, the members of those orders visited the Mohammedan countries on the Mediterranean and procured the liberation of the enslaved Christian captives and restored them to their native countries. The Trinitarians had at one time 250 houses; the Christians redeemed by them, from first to last, numbered over 30,000. The order of Mercy was at first a military order, but in 1218 it put off its military character, and devoted itself wholly to the charitable work of redeeming the captives.

There seemed to be now a sufficiency of religious orders to satisfy all needs. But at this very time, the beginning of the 13th century, two new orders were instituted—and that by Pope Innocent III., who in the Lateran Council had procured the enactment of a decree forbidding the creation of new monastic orders. The new institutes were the order of the Friars Minor (Franciscans) and that of the Friars Preachers (Dominicans); and to these very soon were added two more—the order of Austin Friars (Augustinians) and that of the Carmelites. These are the four mendicant orders, so called because by their rule they renounce all property and all endowments and subsist on the alms of the faithful.

The membership and the establishments of these mendicant orders increased with astonishing rapidity throughout the whole of Europe. Dominican and Franciscan friars were soon the great lights of the theological schools—Albertus Magnus, the Doctor Universalis, as he was styled by his contemporaries, and Thomas of Aquinum, the Angelic Doctor, being the foremost of the Dominican divines, and Duns Scotus, the Doctor Subtilis, and Roger Bacon holding the first rank among the Franciscans. The friars were also effective missionaries both

MONACO — MONAGAS

among the poor and the rural populations at home and among the heathen and the infidels.

The Company of Jesus is the latest of the great religious orders; it was founded in 1534 and its mission was to resist the onward march of Protestantism, directly by combating the Protestant assault on the Catholic Church and by instructing the Catholic populations in the grounds of their religious faith and practice; indirectly by organizing a system of higher education for Catholic youth, and offering educational advantages superior to those afforded by Protestant universities and academies. The Company of Jesus took also as its special field of labor the evangelization of the heathen.

Nearly all the later religious orders and institutes have had for their object the Christian education of the young, the reformation of the fallen, or the relief of the poor and distressed; among the orders established for these ends are those of the Nuns of the Good Shepherd, the Sisters of Charity and of Mercy, the Brothers of the Christian Schools, and numerous other congregations.

The Reformation was hostile to monasticism, and in those countries where it obtained, the monasteries were suppressed and the monastic life disappeared. Henry VIII. seized upon the monastic properties throughout his realm and applied them for his own religious or secular purposes. In Protestant Germany, Scandinavia and Switzerland, the monastic institution ceased to exist shortly after the triumph of the Reformation. In the 18th century a concertedly hostile movement against monasticism took shape in all the countries under Bourbon rule. The governments of Portugal, France, Spain, Sicily and some of the Italian principalities expelled the Jesuits and brought such political pressure to bear upon the Papacy that Clement XIV. reluctantly signed the decree suppressing that famous Society in 1773. Pius VII. restored the Society in 1814. During the latter half of the 19th century a recrudescence of hostility on the part of the governments of the Latin countries against the religious orders manifested itself. In Spain, France, Italy, Mexico and some of the South American republics expulsion for some orders and hampering restrictions upon freedom for others have contributed to retard their growth and development. The reasons usually alleged for these coercive measures by these governments are political and economic, the merits of which it would be out of place to discuss here. At the present time the French government has aimed a deadly blow at monasticism in that country in its Associations Law. Germany admits all the religious orders except the Jesuits. In Great Britain full freedom is now given in the establishment and development of monastic institutions. In the United States, where there are absolutely no legislative restrictions upon the freedom of monastic life, the religious orders are in a flourishing condition. In this country there are 8,000 male and 45,000 female members of religious orders.

In the Church of England within the last fifty years there has been a revival of the monastic idea with no inconsiderable results. Dr. John Mason Neale, and Canon Carter promoted the establishment of sisterhoods (of St. Margaret and of St. John Baptist), in which life vows of poverty, chastity and obedience were taken, and a mother house of the Sisters of St.

John Baptist was founded in New York as a branch of the central house in England. There is also the Protestant Episcopal sisterhood of St. Mary and many others in the United States. Among the male orders of Protestant monasticism must be mentioned the Cowley Fathers, founded by Dr. Benson, and in the United States the Order of the Holy Cross, a preaching order founded by J. O. Huntingdon, son of Bishop Huntingdon. An order of monks was also founded by Rev. Joseph Leycester Lyne in 1870 at Llanthony Abbey, Wales, and the strict rule of St. Benedict was adopted. It is no exaggeration to say that the monastic movement is now flourishing, both in the Church of England and in its daughter church, the Protestant Episcopal Church in the United States.

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Monaco, mōn'ā-kō, the smallest independent European principality, bordering on the Mediterranean, 9 miles east of Nice, and enclosed on its land borders by the French department Alpes-Maritimes. It had an area of 53 square miles until 1861 when the Prince of Monaco ceded Mentone and Roccabruna to France for 4,000,000 francs. The principality has since been confined to the towns of Monaco, Condamine, and Monte Carlo with the surrounding districts, having an area of about 8 square miles, and a population (1900) of 15,180. In the 10th century the Emperor Otho I. conferred Monaco on a prince of the house of Grimaldi, a scion of which (through a female branch) still continues to rule. The expenses of government, municipal and other, are defrayed by a joint-stock company, which carries on the famous gaming establishment at Monte Carlo, and which also pays a handsome yearly sum to the Prince for the concession. The capital, Monaco (pop. 3,292), situated on a lofty promontory overlooking the sea, in the midst of olive, orange, and lemon groves, is a renowned watering-place. Here are the palace and cathedral. Below is La Condamine, or the new town, larger than Monaco itself (pop. 6,218). A short distance to the northeast is Monte Carlo (pop. 3,794), with the handsome gaming casino surrounded by beautiful grounds. There are numerous hotels here and at Monaco, and an English church at the latter.

Mon'ad, in biology. See INFUSORIA.

Monadnock, mō-nād'nók, New Hampshire, a mountain near the southwest corner of the State, in Cheshire County, 10 miles southeast of Keene. The base covers an area of five miles by three, and the altitude is 3,186 feet above the level of the sea; it is composed of slate, talc, and mica. The summit commands a fine view, and it is a conspicuous landmark, visible even from the dome of the state house at Boston.

Monagas, José Tadeo, hō-sā' tā-dā'ō mō-nā'gās, Venezuelan soldier: b. Maturín, Venezuela, 28 Oct. 1784; d. El Valle, Venezuela, 18 Nov. 1868. He served in the war of 1813-21 under Bolívar and rose to the rank of brigadier-general and was afterward engaged in various military measures until 1830 when he became a member of congress. Bolívar's death occurring in 1831 Monagas retired but was soon called to the command of the Orient. In 1835 he sup-

ported a revolution but made his peace with the government a few months later and in 1847 was elected president. His administration was at first marked by liberal measures, but his policy becoming arbitrary he was deserted by his party, whereupon he abolished congress and assumed a dictatorship. He defeated Paez who led a revolutionary movement against him and disregarding his treaty, imprisoned him, and in 1851 took command of the army, the presidency being held by his brother. In 1855 he was re-elected, but a revolution followed and he was compelled to leave the country in 1858, after resigning the presidency. He returned in 1864 and in 1868 headed a successful revolution and was elected president by Congress, but died before being installed in the office.

Monaghan, mōn'a-gan, **John James**, American Roman Catholic prelate: b. Sumter, S. C., 23 May 1856. He was educated at St. Charles College, Md., pursued a theological course at St. Mary's Seminary, Baltimore, and was ordained to the priesthood in 1880. He held several pastorates in Charleston, S. C., and elsewhere, was chancellor of the diocese 1887-8, and assistant to the vicar-general at St. Patrick's, Charleston 1888-97. In May of the last named year he was consecrated bishop of Wilmington.

Monal, or **Monaul**, a name among Anglo-Indian sportsmen for any of several Himalayan pheasants, especially the gorgeous species of the crested genus *Lophopterus*. See IMPEYAN PHEASANT.

Monamine, in chemistry, an amine that is derived by replacing one or more of the hydrogen atoms of a single molecule of ammonia by an equal number of monovalent organic radicals. Amines that are derived by joining two, three, or four molecules of ammonia, through the partial replacement of their hydrogen by a single polyvalent radical, are called di-, tri-, and tetra- amines respectively; and the monamines are known as primary, secondary or tertiary, according as one, two or three of the hydrogen atoms of the ammonia molecule have been replaced. See AMINE and AMIDE.

Monarch Butterfly. See DANAIS; MILKWEED BUTTERFLY.

Monarchians, a sect in the early church who asserted the oneness and singleness of the divine person, as at variance with the orthodox doctrine of the Trinity, three Persons and one God. The supremacy of God the Father, they maintained, was impugned by those who said that the Son was coeternal. If there was but one God, they taught, and Jesus Christ was God incarnate, then the Father must have suffered and died. Hence they were called Patripassians (q.v.). Christ was therefore merely one form or mode of the Father's manifestation; and the Father might also manifest himself through the Holy Spirit. This theory was called Modalism or Monarchical Modalism and its teachers Modalists. Praxeas (q.v.), a Christian of Asia, brought this doctrine to Carthage in the 2d century and was controverted by Tertullian (q.v.). The most noted of Patripassians was Sabellius (q.v.), and Modalism was widely known as Sabellianism in both the Eastern and Western Churches. There were other Monarchians called Dynamic Monarchians who taught that Christ became Son of God dynamically, by hav-

ing certain powers bestowed upon him in his adoption by baptism. Pope Victor I. in the 2d century excommunicated Theodotus the Tanner who professed this theory, and an Asiatic synod (268) condemned and anathematized the view as taught by the noted Paul of Samosata (q.v.), the minister of Zenobia (q.v.), queen of Palmyra. Monarchianism was revived in the 16th century by Socinus, and is in some form or other the essential basis of certain Unitarian creeds.

Monarchy, a form of government in which the supreme power is vested in a single ruler, and which is absolute, limited, or constitutional, hereditary, or elective.

Monastery. See MONACHISM.

Monastery, The, a novel by Sir Walter Scott, published in 1820, the scene of which is Scotland in the 16th century. In this tale Scott for the first time introduces a supernatural element, as in the mysterious appearances of the 'White Lady of Arenel,' and for this reason the book was never as popular with English readers as his other tales. Its sequel, 'The Abbot,' appeared the same year.

Monas'ticism. See MONACHISM.

Monastir, mō-nās-tēr', or **Bitolia**, bē-tō'-lī-a, Turkey, a city and vilayet of Macedonia (q.v.). The city, 86 miles by rail northwest of Saloniki; is built at the west edge of a plain, in a recess formed by two lofty mountains, and is intersected by a river, crossed by numerous bridges. The streets are wide and well-paved; the houses neat and clean; the mosques and minarets, picturesque; and the bazars handsome. It is an important central situation for all military operations relating to this part of Turkey. The majority of the inhabitants are Greeks and Bulgarians, the Turkish residents being mostly soldiers or officials. It carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. Pop. about 40,000.

The vilayet has an area of 10,690 square miles; pop. (1903) 847,400.

Monazite (Greek, "solitary," in allusion to its rare occurrence), a native phosphate of the metals of the cerium group, often also containing more or less thorium silicate. It is reddish or brownish in color, with a resinous lustre, and crystallizes in the monoclinic system, though it also occurs in massive and granular forms. It is commonly translucent and brittle, with a hardness of from 5 to 5.5, and a specific gravity of about 5.0 to 5.2. It is found at Norwich, Conn., and also in the Ural district, as well as in other parts of the world. The chief commercial supply, however, comes from North Carolina and from certain parts of Brazil. In these regions monazite is a constituent of the granitic rocks, and is obtained by washing the gravels and sand that have been formed by the disintegration of those rocks. The Brazilian output has been controlled by a German syndicate since 1902, and practically all of it now goes to Europe. The monazite produced in the United States comes chiefly from Burke and Cleveland counties, North Carolina. The total production of the mineral in this country in 1901 was 748,736 pounds. Monazite owes its industrial importance to the cerium and thorium that it contains, the former being utilized for the preparation of cerium oxalate, which is used in medicine and in the arts, while the thorium is

employed in the manufacture of mantles for incandescent gas-lighting.

Monbod'do, James Burnett, Lorn, Scottish judge and philosopher: b. Monboddoo, Kincardineshire, October (or November) 1714; d. Edinburgh 26 May 1799. He was educated at Aberdeen, Edinburgh, and Groningen, soon became a leading member of the Scotch bar, and in 1767 became ordinary lord of session. As a judge he was able and lucid, but usually differed with his colleagues. His literary fame is due to his work 'On the Origin and Progress of Language' (1773-92), in which he held that language was a human invention traceable west from Asia, and to his 'Antient Metaphysics' (1779-99), a work held in contempt by his contemporaries, but now recognized as important in the history of philosophy, because of its praise of Greek philosophy, thus approaching Neo Kantianism, and for its treatment of man as one of the animals, suggesting in this and other respects Darwinism.

Moncheur, mōn-shēr, Ludovic, BARON, Belgian diplomat: b. Brussels 12 May 1857. He was educated at Louvain, entered the diplomatic corps, became attaché to the Belgian legation at The Hague in 1883; held posts in the legations to Vienna (1885), Berlin (1887), and Rome (1892); after a year as *chargé d'affaires* to Luxembourg became minister to Mexico in 1898; married the daughter of Powell Clayton, U. S. minister to Mexico; and in 1901 became minister to the United States. He has written on the geography of Mexico and is a member of the Antwerp Geographical Society.

Monclova, mōn-klō'vā, Mexico, a town of Coahuila, the terminus of a branch line of the Mexican International railroad to Cuatro Ciénegas, 100 miles northwest of Saltillo. Monclova dates from the 17th century and was formerly the capital of the dual state of Coahuila and Texas. It has railroad works, and a trade in the agricultural produce of the region. Pop. 15,000.

Moncrieff, mōn-kre'f, Sir Alexander, British ordnance expert, inventor of the disappearing gun system: b. Scotland 17 April 1829. He was educated at Edinburgh and Aberdeen; was apprenticed to a civil engineer; served in the Scottish Royal Artillery; and during the Crimean war began to plan the Moncrieff ordnance system, also called the protected barbette, or the disappearing system. The important point in this system is that the recoil of the gun is utilized to drop it out of sight after firing and to raise it again when necessary, a contrivance which did away with the cumbrous and expensive system of steel-plated forts then in vogue. It substituted for them the simple, inexpensive Moncrieff pits, mere slight excavations for the masking of coast batteries.

Moncrieff, Robert Hope, "Ascott R. Hope," British author: b. Edinburgh 1846. He began to study for the bar but forsook law for literature and under various pseudonyms, but mainly that of "Ascott R. Hope," has published more than a hundred books of fiction and other works. Among them are: 'Hero and Heroine'; 'Homespun Stories'; 'Ready Made Romance'; 'Tales for Toly'; 'Album of Adventure'; 'Wigwam and Warpath.'

Moncton, mūn'k'tōn, Canada, a city and port of entry in Westmoreland County, New

Brunswick, at the head of navigation of the Petitcodiac River, a tidal stream entering the Bay of Fundy, and on the Intercolonial Railroad, 86 miles northeast of Saint John, and 185 miles northwest of Halifax. The offices and chief workshops of the Intercolonial Railroad are situated here, and it is a busy industrial and agricultural centre, with manufactures of sugar, cotton, woolen, leather, woodware, tobacco, etc. Pop. (1901) 9,026.

Mond, mönd, Ludwig, English manufacturing chemist: b. Cassel, Germany, 7 March 1839. He was educated at the Cassel Polytechnic and the Universities of Marburg and Heidelberg; went to England in 1862, to enter the employ of the Leblanc soda works, where he introduced his method of recovering sulphur from alkali waste; in 1873 introduced the Solvay process of manufacturing ammonia soda into England; and has since continually improved this process. He has invented a means of manufacturing chlorine as a by-product of the ammonia soda process, and has devised new gas-batteries, new processes for manufacturing nickel, based upon his discovery of nickel carbonyl, and a new method of producing gas for power and heating, ammonia being a by-product. In 1896 Mond endowed the Davy-Faraday Research Laboratory at the Royal Institution. He is a prominent member of various English and continental learned societies.

Mon'day (*moon and day*; Saxon, *Monandæg*; German, *Montag*; Latin, *luna dies*;;), the second day of the week, formerly sacred to the moon. See CALENDAR.

Mondovi, mōn-dō-vē', Italy, an episcopal city in the province of Cuneo, 58 miles by rail south of Turin. Its chief building is the 15th century cathedral of San Donato. Silk, cloth, paper, pottery, machinery, etc., are among its manufactures and it has a school of industrial arts and handicrafts. Near the city the Sardinians were totally defeated by Napoleon 22 April 1796. Pop. (1901) 19,255.

Mo'ner, the simplest form of protozoan, and regarded as the simplest known animal organism. It was made by Haeckel the type of a separate group (*Monera*), characterized chiefly by lack of nucleus, but further investigation showed that the moners had no just right to this distinction, and they are included among the rhizopods in the order *Lobosa*. One of the forms most frequently met is *Protoamaba*. Consult: Haeckel, 'History of Creation' (1876); Parker and Haswell, 'Text-book of Zoology' (1897).

Monet, Claude, klōd mō-nā, French impressionist painter, leader of that school: b. Paris 14 Nov. 1840. He was brought up in Havre, where his father was a merchant. To coax him out of his love for art he was allowed to enter the army; but his first glimpses of Algiers made him more the artist than before. At 22 he resigned from the army; began to study art; worked under Gleyre in Paris; soon broke with his master who would not allow him to draw what he saw; and became a plein-airist and for the time a follower of Boudin, a French marine painter. The Salon was rigidly closed to his pictures, and as he grew in power he soon lost all traces of academic influence, even that of the Barbizon School, and became the first

MONETA—MONEY

of the impressionists. He painted a few interiors, but was more at home in his landscapes. In these he made the most conscientious effort to reproduce exactly light and atmosphere, working on one canvas day after day at the same hour for a short time under practically identical conditions of lighting and air. This habit is the more interesting because of Monet's series of pictures, each series showing the same natural object in different settings of light and atmosphere,—for example, his scores of 'Haystacks' or the many pictures of Rouen Cathedral. He was the first to use the unmixed tones in painting "vibrating light" and is particularly fond of blue and yellow as color themes. Maupassant said of him that he "discovered the art of painting." His best canvases are 'The Mouth of the Seine,' 'Lavacourt,' 'Bordighera,' 'The Orchard,' and 'Snow of Port Villers.' More than a score of his paintings belong to Americans and were exhibited at the Lotus Club, in January 1899.

Moneta, in Greek mythology, a name applied to Juno, known as the goddess of coin or money.

Monetary Commission of the United States Congress, a commission appointed in August 1876, by the 44th Congress, to inquire into the causes and economic effects of the decline in silver, the best means for resuming specie payments and other national monetary questions. The commission consisted of three Senators, three Representatives and three monetary experts. Meetings were held in Washington and New York, during a period of six months. The results of these conferences were published by the government in monographs issued by the Treasury Department. See MONEY.

Monetary Conventions, conferences between European nations, for the regulation of their coinage. Two of such conventions have been held, the "Latin Monetary Convention," and the "Scandinavian Monetary Convention." The former includes France, Belgium, Italy, and Switzerland, the agreement having been made in December 1865, in virtue of which the coinages of those countries are of the same weight and fineness. Greece subsequently joined the convention, and assimilated her drachma to the franc. Spain, Austria and Hungary, Finland, Rumania, Servia, Bulgaria and Monaco have also coined large amounts of either or both gold and silver money, of weight, fineness, and value, exactly proportionate to, or identical with that of the countries included in the convention. Since 2 Aug. 1892, the gold standard has prevailed in Austria, and since 1 Oct. 1897, in Japan. The "Scandinavian Monetary Convention" dates from 1873, and includes Norway, Sweden, and Denmark. See MONEY.

Monetary Systems. See BIMETALLISM; MONEY.

Monite, a native acid phosphate of calcium, CaHPO_4 , occurring massive and in small, triclinic crystals, in the islands of Moneta and Mona, in the West Indies. The mineral is found in limestone, beneath a deposit of guano. (Also spelled "monitite.")

Money, the term used to designate the medium of exchange, the standard or measure of value; in ordinary use, however, it is applied only to coin and paper currency.

Barter.—The primary trading of mankind was simply the exchange of one object for another, termed *barter*. In the course of the development of the race, the increasing interchange of commodities between individuals and tribes made it evident at a very remote period that even the crude form of commerce then existing would be greatly facilitated by the use of some one commodity as a general medium. The difficulties encountered in the process of mere bartering, even in the age when man's wants as well as his products were few, can be appreciated only if we can imagine conditions under which, for example, a producer of wheat desiring shoes, were compelled to find a shoemaker who at the same time needed wheat and would part with the shoes in exchange therefor. If the latter's need for food-stuff were fully supplied, he would not care to exchange the leather and labor represented by the shoes for grain; but he might be in need of a hammer and nails and the owner of the wheat would be compelled to find a blacksmith desiring wheat, from whom to obtain that which would procure him the shoes. It is quite conceivable that the purchase of a pair of shoes then cost more time and trouble than their manufacture; but when the farmer could exchange his wheat for something which the shoemaker in turn could use to procure a hammer and nails, or almost anything else he needed, the trade was easily consummated. Again if the question arose, How many nails will equal the cost of a pair of shoes? the answer might be difficult; whereas when a definite quantity of nails is to be had for a certain quantity of money which in turn is the cost of the shoes, the measuring is speedily accomplished. What may be termed the *lesser trade* (retail) of the world consists of an almost unlimited number of such transactions which are now so readily adjusted by means of money, that its importance as a medium is rarely thought of. Yet there is probably no device that mankind has made use of which has served more effectively to promote civilization.

Early History.—A multitude of articles and substances have been utilized for the purpose of money, the selections depending in each case upon the attending circumstances: in the nomadic state skins of animals, in the agricultural the animals themselves (domesticated); proximity to the seashore furnished the opportunity to use shells, usually those of a superior quality; staple products of the soil, such as grain, beans, tobacco, etc., proved acceptable at times; later almost all of the metals known to the ancients came into use, practically in the order of their value to-day, the less valuable first. Indeed the evolution was steadily toward the commodity which would serve the purpose best, each of the others being rejected in turn as experience disclosed its defects. This progressive improvement took place in each community as its civilization advanced; hence some were ahead of others and profited thereby. The use of articles generally condemned as unfit still continues among peoples only partially civilized; thus lead is still used in Burma, cowrie shells to this day form a part of the money supply of Siam and countries round about, and beads are current money in many parts of Africa and Oceania. We find that in communities well advanced in civilization the paucity of precious metals and other circumstances compelled the

MONEY

use of other articles; thus in the successive frontier settlements in the United States skins of beaver and other fur-bearing animals were generally given monetary functions; and it will be recalled that the early colonists employed the wampum (shells) of the Indians in the North and tobacco in the South. It was requisite that the object selected to serve as money possess value, immediate or potential, for ordinary uses, for purposes of ornamentation or for the gratification of other desires; since no one would, generally speaking, part with his property or his labor for something having no value direct or indirect, objects lacking this quality could not for any extended period prove acceptable.

Gold and Silver.—The selection of the precious metals (gold and silver) which in the course of the evolution became so general, was preceded by their use for ornamentation which made them almost universally desirable, giving them a special value. This value has been substantially increased by their use in the arts; but their use as money unquestionably has added much more; for it must not be lost sight of that gold and silver are commodities the value of which is subject to the same law of demand and supply which controls that of other commodities; the monetary use of the metals now constitutes the chief demand. The ultimate selection of these metals for the principal monetary purposes was due entirely to their special adaptability, hence to the operation of natural law. In addition to their being desirable, they possess the following qualities now demonstrated to be requisite to a just and equitable medium of exchange, and without most of which no substance could serve as an honest measure of value: relative *scarcity* compared with iron, lead, copper, etc., to which are due their greater value and the relatively greater stability of their value; *portability*, containing as they do large values in small bulk; *durability*, since they are not subject to corrosion or other ordinary decay, hence practically indestructible; *homogeneity* or uniformity, since unlike other commodities the quality of these metals (when duly separated) is practically identical no matter where they are found; *divisibility*, rendering them capable of being divided into small parts and again united without appreciable loss. Manifestly a commodity frequently varying in value (wheat for example) would not serve as a just measure any more than would a yard stick that grew shorter or longer; a destructible commodity might cause the seller to be deprived of a part or the whole of the value which he expected to possess when he parted with his goods; bulkiness and indivisibility would seriously hamper exchanges; furthermore if too plentifully and easily produced the metals would be worth less and be subject to too much fluctuation.

Early Coinage.—The historical evidences of the early uses of gold and silver are not such that a fixed date can be referred to; it is, however, certain that silver was in general use before gold, and that both were employed as early as 1800 B.C., which indicates that the intelligence of certain nations, born of their experience, had caused them to seek for something possessing some or all of the attributes above named for several centuries anterior to that date. During all of this period and certainly until 900 B.C. the metals passed by weight, in bars and ingots or in crude form (dust, etc.); the shekel,

the talent, the as, of the ancients were weights just as the tael of China is to-day; and the names of certain coins are, or were, names of weights, viz.: drachma, mark, pound, livre, lire, peso, peseta. The use of the metals as money by weight for the greater portion of the trading at that time proved a cumbersome process, involving as it did continuous reference to scales; and doubtless the defects in the means of weighing and of determining the purity of the metals, brought about over-reaching and innumerable disputes. It was therefore a most important advance when by the introduction of the device of coining both the weight and the purity of the metals were certified by a more or less authoritative stamp. History accords the credit of this improvement to the early Greeks, and fixes the date at about 900 B.C. As in the course of time other nations adopted the same method, and the authority to coin money was by common consent given to the rulers, the people regarded themselves protected against fraudulent impositions of base metals and false weights, and exchanged their products freely for this convenient form of money. It must be continuously borne in mind that the great mass of people, even in the present enlightened age, know comparatively little of the character and functions of money; and in the early ages they necessarily depended in a much greater degree upon certain marks to identify the coins, after learning by experience that certain pieces would, and others would not, procure for them what they required; and since the chief end in view was the facilitation of the exchanges in every way possible, the enormous advantage of a system of coined money becomes apparent. Moreover coin served more effectively for the measuring of values: definiteness, precision and prompt action became possible; while in the periods when other articles were used and in a less degree only when the metals were employed by weight, these elements were lacking, and measuring values was continuously attended by obstacles. The general adoption of silver, and later gold as well, for money coinage did not prevent the extensive use of copper and other metals for the same purpose; but important as the functions of these base-metal coins were for long periods, they need only be discussed as "token money" to which they were ultimately reduced by all nations.

False Money.—The coining power has universally been recognized as a prerogative of the government, no matter what the form of the latter; unscrupulous monarchs took advantage of the ignorance of the people to debase the "coins of the realm," causing them to be made of less metal than the stamp indicated; this method of defrauding the people was also imitated by shrewd individuals who reduced the value of the pieces by "sweating" (removing part of the coin by chemical or artificial means), and by clipping off a portion; beside these practices the natural abrasion (from wear and tear in use), when coins were circulated for too long periods, also served at various times to render the money of some countries the means of cheating the ignorant and unwary. These base coins were usually detected only when they reached the few intelligent persons, who refused to receive them at their stamped valuation; but even thereafter the pieces circulated quite freely because of the imperative need of the people for some form of counters with which to make

MONEY

their daily exchanges. When the cheating became unbearable, the people rebelled and corrective measures were adopted or a new ruler was substituted. In many instances the ruler's fraud was followed by an edict that the base coins must be received by the people at the valuation expressed thereon, which edicts were practically the first "legal tender laws," of which more hereafter. Honest errors of judgment also caused similar results; thus in 1792 our mint law fixed the ratio of silver to gold at 15 to 1, when the actual ratio was seriously fluctuating; the disturbance caused continued until the change in 1834 when the ratio of 16 to 1, also erroneous but in a less degree, was adopted. These attempts to arbitrarily interfere with the operation of the natural laws of money and exchanges served only temporarily, since the prices of commodities soon adjusted themselves to the new standards thus created. In other words, an article selling usually at a shilling would, when the shilling was reduced to one half its former weight in silver, cost two shillings; the shilling in effect became only a half shilling. As the trade between nations developed this also served to correct many of these evils; for obviously the force of the legal tender laws did not extend beyond the borders of one country; and not only was the mercantile class sufficiently intelligent to detect base or reduced coins, but those in the international trade refused to recognize the stamp as conclusive evidence of the value of the coins, accepting them only by weight and fineness (purity of the metal); indeed international transactions in the metals are to this day effected by weight and not by tale or number of pieces. Hence, it may be observed here, bullion (uncoined metal) is generally preferred to coin for international settlements. The point to be specially noted, is, that the natural economic laws prevailed in the long run, despite royal edicts and laws of parliaments, which endeavored to establish fictitious values and unjust money and measures. During one of the periods when England was suffering from the wretched state of its coins (about 1559), a study of the conditions led to the discovery of what is known as Gresham's law, that good money will be displaced by bad in a community where the bad money may be used to discharge obligations. Manifestly if one species of coins contained greater value than another, both having equal debt-paying power, the inferior would be parted with first and put into circulation. In obligations payable outside the country the superior pieces would be employed, thus leading to their exportation. For example, the grain of gold has a value, practically fixed, throughout the civilized world; a coin which the law decrees shall contain 100 grains, may circulate at home even when reduced to 99; the full weight piece alone will bring full value abroad.

Credit.—The use of the precious metals and especially after the introduction of coinage, developed further functions of money, namely, its service as a *store of values* and as a *standard for deferred payments*; every individual having a surplus of products beyond his needs was able, by exchanging it for coin, to lay away the latter for future needs, conscious of the fact that such action in no wise depreciated his wealth; and moreover he could dispose of his commodities for a promise to pay such coin in the future knowing that ultimately the value would come to

him if his debtor met his obligations. The latter form of transactions was possible only after a community had reached a stage of civilization when *credit* became a factor; when men trusted each other to a measurable degree; when leases, promissory notes, and other forms of contracts came into vogue. The great importance of the requisite of *stability* of the medium of exchange can be better appreciated when considered in connection with these two functions; a form of money which might in several months, or a year, lose a substantial part of its value would defraud him who was to receive it or who held it for future use; conversely if the money appreciated the debtor would be mulcted by being compelled to give greater value than he actually contracted to give. These principles were not learned at once even by the most intelligent; it was necessary that mankind pass through many periods of oppression and distress before they became patent; the people were ultimately brought to demanding not only that their rulers act honestly respecting money, but that tampering with it by individuals be punished most severely; even our own first mint act (of 1792) provided the punishment of death for debasing the coinage on the part of mint officers.

Ratio.—When the two precious metals came into joint use, the fact that gold was, owing to its greater scarcity, superior qualities, and beauty, esteemed more highly than silver, made it necessary to recognize it as of greater value in money form; this value relation is known as the *ratio*. For many centuries silver and gold were thus used jointly by the civilized world, both having full debt-paying power when coined; more silver being universally required to constitute a given coin value than if the coin was of gold; and although the process was slow, the value of silver gradually fell, a larger supply relative to the demand (and compared with gold) having been made available by the products of the mines. Thus, the ratio which at the beginning of the Christian era was about 9 to 1, had fallen by 1500, to 11 to 1; in 1600 about 12 to 1 is recorded; in 1700 it was 15 to 1; in 1800 15.4 to 1; in 1870 15.6 to 1; moreover the fluctuations in the intervals had been very considerable; and since the world's intelligence was continually seeking for greater stability, a definite movement for the demonetization of the white metal began soon after the last mentioned year. This involved not only the sale of old silver coins but diminished the demand for silver for new coinages, and necessarily accelerated the fall in its market value; with the result that the ratio at the beginning of the 20th century, when practically all civilized nations had adopted the single gold standard, stood at 32 to 1. But it was only as full-debt-paying money that silver was demonetized; in fact, more silver is in actual monetary use than ever before, but in a subordinate capacity, as subsidiary coin, for the smaller payments of retail trade and for fractional sums.

Subsidiary and Token Money.—Subsidiary coin is designed for domestic use only, each nation having its own. By making the pieces of less relative value than the chief coins, they were rarely exported; whereas formerly the people were deprived of their "small change" whenever an extraordinary demand for silver arose. Thus in the United States in 1845-52, there was such a dearth of fractional

MONEY

pieces that the people were compelled to use tickets, stamps, etc., until by the law of 1853 the coinage of pieces of less weight was ordered. (Two half-dollars weigh about 7 per cent less than the silver dollar.) Subsidiary coin has only a limited legal tender power; indeed it may be said that it is a higher species of token money, by which is meant a form possessing little or no value, and used merely in the capacity of counters, but indispensable for the smallest transactions. The ordinary token money is to-day made of nickel and of bronze (a composition of copper, tin and zinc).

Quantity of Money.—The quantity of money available is an important factor in the maintenance of stability of values; a surplus causes a rise, and a dearth brings about a fall, of prices. The interest or discount rate is the index of the supply, and is regarded as the price of money. But the quantity which any given community requires can not be determined with anything like definiteness. If natural laws alone operated, the movement in prices would in large measure correct a temporary local dearth; for prices ordinarily indicate the measure of the demand for money, and it will like other commodities flow to the locality where it commands the best return. A general dearth, however, brings about distress, paralyzing exchanges and checking enterprises; a general plethora has the contrary effect, and unless corrected causes overspeculation and its attendant evils. Statistics of the world's metallic money supply are not available for the earlier periods; but existing estimates of the European stock give for about the beginning of the Christian era \$1,800,000,000; for 500 A.D. less than \$500,000,000; for 800 A.D. less than \$200,000,000. To this enormous decrease is attributed the backward trend of civilization during the Dark Ages, a tendency not counteracted until after the discovery of America (1492) and its vast stores of silver and gold; by 1600 the stock available is estimated at \$650,000,000; by 1700 it had reached \$1,500,000,000; early in the 19th century the \$2,000,000,000 was reached; and at the opening of the present century the stock of gold and silver in the world was approximately \$8,500,000,000. Of the annual product of gold, now about \$300,000,000, about 70 per cent is added to the money supply.

Credit Money.—Notwithstanding the portability of the precious metals it was in time found practicable to save the trouble, risk and cost of transfers of coin and bullion, by the introduction of paper representatives of the metals. The earliest form of these now so generally acceptable devices was merely a receipt given by the gold- and silver-smiths and others who made the handling of the metals a special business. Obviously this was possible in any important degree only after *credit* had become a factor in trading. Indeed, the earliest instance in the history of the Western World of the use of a substitute for coin was the practice of merchants, begun in Italy some six centuries ago, of depositing their specie with one of their number, each receiving a credit upon his books and making payments by transferring such credits to others; a crude form of banking said to have arisen because of the great diversity and variation in value of the coins issued by the numerous small principalities then existing. (It is a well established historical fact that in China

the use of these and much more advanced forms of paper money were in use some centuries earlier). The paper receipts and book credits were in time followed by orders to pay the specie deposited, which were acceptable wherever the parties to the transaction were known; the use of such orders became quite general among merchants, and as credit became more general they were also employed in international transactions; in the last mentioned use they were called bills of exchange.

Bank-checks and Bank-notes.—Another form of transfer of credit is the bank-check, which is an order upon the bank where money has been previously deposited or a credit established otherwise, to pay money in discharge of a purchase or obligation. These several devices save not only the transfer of the coined money, but practically increase the amount available; fully 97 per cent of the enormous volume of the international commerce, and 92 per cent of the equally large domestic trade transactions in the United States, are adjusted by means of bills of exchange, drafts and checks, thus avoiding the necessity of sending coin to and fro, and enabling its utilization for other purposes. The process of banking has added further to this economization of coin; for the bank-checks, while not circulating extensively, nevertheless very frequently pass from hand to hand and only a small portion of the great mass is ever presented to be paid in money, the rest being deposited to establish fresh credits in the banks; and the banker is enabled to use a substantial part of the cash held by him to give further credits. The institution (about 50 years ago) of clearing-houses, where the banks exchange these deposited checks daily, further reduced the amount of money actually handled. While these instruments are not ordinarily termed money, it will be observed that, since they perform a most important part of the service of a medium of exchange, the designation of *credit money*, applied to them in the recent past, is entirely appropriate. A form of paper which is more generally regarded as actual money, known as the *bank-note*, was an evolution from the preceding forms. It is merely the promise of the bank, authenticated by its officers, to pay a fixed sum of money on demand, and in its earliest form represented coin actually held in bank to redeem it. The Bank of Sweden is credited with having first (1658) issued this form of paper money. Originally written, the notes were ultimately in printed form, for round sums and small denominations. The great convenience of bank-notes for general use by the more intelligent in the community, soon made it evident that only few out of a given number were presented within a given time; the banker thus found it practicable, when his credit was well established, to issue more notes than the sum of coin in bank available for their redemption; and further experience demonstrated the practicability of issuing two, three, and even four for one, under ordinary conditions; while it is not actually fixed what proportion of coin should be held in reserve, this depending not a little upon local customs, the margin may be stated at from 25 to 40 per cent. Here we have manifestly another means of increasing the potentiality of coined money to a community. As the mass of the people gradually learned that bank-notes were a safe and useful medium, the number of

AGGREGATE OF MONEY IN WORLD BY COUNTRIES.

(MILLIONS OF DOLLARS)

AMOUNT OF MONEY PER CAPITA IN THE WORLD, BY COUNTRIES (DOLLARS)

MONEY

banks increased and provided notes for the several communities.—The conclusion that bank currency is a most valuable adjunct to coined money, rests upon solid premises; the supply of the precious metals alone could not have served the civilized world adequately in the development of trade and industries, which history records as the work of mankind in the last three centuries; even to-day the enormous supply is insufficient to meet the demand. Upon the other hand, the history of such currency, particularly in the United States, demonstrates that without the most carefully devised safeguards, it may, and usually will, become a curse to the people. Having in mind the indispensable requisites of a medium of exchange as hereinbefore set forth, it is obvious that bank-notes possess such requisites only when their credit is fully assured; in short, when the coined money can be secured if and when demanded. If this credit is lost, depreciation follows; the depreciated paper brings about results similar to those caused by debased coin, and is worse since, having not even a fraction of intrinsic value, it causes, when entirely discredited, complete loss to the holder; at best it has only a fluctuating value in exchange, and hence can easily be used as an instrument to defraud. In like manner, also, as in the case of debased coin, it drives out the better money. The community must therefore protect itself by law against such evils. Excessive issues of bank-notes, by inordinately expanding the amount of the available medium, are also followed by a measure of discredit, and frequently cause all the evils of depreciated paper. It is hence a requisite of a properly adjusted bank currency that the volume shall be regulated by general provisions of law, so that, while supplying the natural need arising from the inadequacy of the metallic medium, it shall not be inflated beyond such needs and thus cause a disturbance in prices, speculation, and an expulsion of part of the coined money. We have in our own history an example of how an ill-regulated currency operates. The people of the United States during a greater part of the period from 1790 to 1865, with some notable local exceptions, had imposed upon them a bank currency which literally defrauded them continuously, because of the absence of those safeguards which the laws should have provided. The paper circulation included notes of mythical banks, notes of banks which never pretended to have coin in reserve, notes of defaulted banks, and of such as had deliberately repudiated their issues; excessive issues were common occurrences; counterfeits abounded, and at times even the pretense of a bank was absent, individuals printing notes for circulation. This mass of paper was not money; the pieces merely served the purpose of counters, so long as the people, in the absence of anything else, were compelled to use them. When the nationalizing influence of the Civil War period prevailed, the people turned from the farcical bank-note system to one which provided for notes secured by bonds, which are absolutely safe but not bank-notes; for the so-called national bank-notes are based upon the credit of the national government.

Government Notes.—This brings us to the consideration of the last of the forms of paper money, the *government note*, which is a promise to pay coin on demand. Except when

in the form of certificates for coin actually held, these notes are dependent upon the revenues and the credit of the government. So far the world's experience with this class of paper money has been invariably disastrous. The beginning of the issues has always been due to extraordinary needs of the government, as in case of war, when the duty of raising revenue by taxation or straightforward borrowing was evaded; and since the exigencies were usually severe, the promises to pay coin were usually broken. Not only did the ensuing discredit cause depreciation, but by the increase of the volume, which always followed, the fall in values was accelerated. Thus, in our colonial period, notes issued by colonial authorities depreciated so that at one time £1,100 of paper was required to obtain £100 coin; in the Revolutionary period continental currency fell to a point where the rate was 1,000 to 1; and during the Civil War our "greenbacks" at one time were worth less than 40 per cent of the face. These notes all served as a medium, but a fluctuating, hence dishonest, one, by means of which the shrewd few were enabled to accumulate inordinate wealth at the expense of the mass of the people. It is patent that individuals hesitated to accept such a medium, non-convertible into coin; and hence legal tender laws were enacted to compel the acceptance. Such notes are generally known as "fiat money," the dictum of law alone giving them currency. Tested by the requisites for an honest medium of exchange, measure of values and standard for deferred payments, government notes, even the best that the ingenuity of man has been able to devise, fail to respond to the requirements. They usually depreciate, and since restoration to equality with specie is expensive, it is generally delayed, rendering the medium unstable for extended periods; equally expensive is the maintenance of a coin reserve, not dependent upon any natural sources of replenishment as in the case of a bank's reserve; the volume of notes, instead of being responsive to the needs of trade, is dependent upon legislative (frequently partisan political) exigencies; such a system must be reinforced by legal tender laws which interfere with the freedom of trade, compelling the acceptance of something which would often preferably be refused. It is not inconceivable that a government note system might be evolved which would fully serve the purposes in view: but it is certain that thus far the bank-note system, adequately safeguarded, affords the only form of paper money that fully answers the requirements. While the best examples of such a system which have stood the test of generations, are not identical in form, the general principles upon which such a system should be based are recognized in each. These principles may be generally stated as follows: (a) paper money should be used merely as an auxiliary to coin, to save the cost of using coin and to supply deficiency in the stock of coin; (b) its volume should be severely limited so as never to be in excess of the bank's ability to supply coin on demand; (c) the volume should within those limits contract and expand with the demands of trade; thus the requisites of security, prompt redemption and flexibility of volume are assured. (Our notes based upon bonds possess only the first requisite.) Inasmuch as the demands of trade constitute the reason for the use of paper money, trade considerations only

MONEY

should govern the extent of their use. To insist, for example, upon a certain amount of money per capita, is obviously unreasonable; no such arbitrary rule of measure is, in the nature of things, applicable. For example, in France, where the people use checks only sparingly, a per capita of nearly \$40 appears necessary; in Great Britain, where the check system has reached its highest development, less than half that amount suffices; with us, where checks are used, but not in so great a measure as with the British, an amount between \$25 and \$30 per capita is still required. At certain seasons, as when crops are moved, a larger supply is necessary; when the period has passed, the continued existence of the added volume disturbs the price equilibrium, hence it should be withdrawn. A crude, and by no means complete, illustration of the operation is afforded by the transactions of a cotton factor who has advanced to the planter capital to gather his crops, and receives the cotton in payment. He proceeds to ship the textile to Liverpool, drawing his draft payable in, say, three months for the proceeds of the sale; this draft, with the ship's bill of lading attached, he takes to the bank for discount and obtains the bank's notes, with which (his replenished capital) he enters upon a new transaction. When the bank has received the amount of the draft on Liverpool it has its cash again in bank, and unless a new transaction presents itself, it should use this cash to redeem its notes and cancel them as they are presented or deposited with it. Thus the volume of its notes is regulated by the demand.

Statistics.—The statistics of note issues are of interest. Generally the information is confined to "uncovered paper," a term used to designate notes issued in excess of coin; sufficient is known to indicate that the volume of notes at present in use in the world is approximately \$6,000,000,000, one half of which is "covered." For 1890 the amount of uncovered paper is given as \$4,230,000,000, indicating a substantial increase in coin reserves made possible by the marked increase in the gold product since the latter date. To show how the currency of the principal countries was affected by this increase, it may be cited that while there were in use in 1873, \$2,322,000,000 of uncovered notes, the figures for 1902, when the gross issue was greater, aggregated only \$1,270,000,000. Adding to the large amounts thus reported the available bank-credit-money (capital and deposits of banks), which constitutes the fund against which checks and drafts are drawn and from which loans may be granted, it is found that the world had, in 1890, approximately \$16,000,000,000 of both credit-money and bank-notes available; in 1902 the sum is stated at \$27,000,000,000.

Conclusion.—We have seen how in the evolution of civilization the need for a standard finally led to the adoption of that article which proved most serviceable for the purpose—gold; we have also seen that mankind was, in the long run, always impelled by the desire to reach, as nearly as was possible, a medium and standard that would prove honest and equitable; that in the choice of an auxiliary this rule of action has likewise governed. It is not impossible that both gold and bank-notes may in the course of the present century be superseded by other articles or devices better

calculated to serve all the needs. A number of propositions looking to such an improvement have been presented and discussed, but none have thus far received the general approval of even the theorists. It is certain that any plan to supersede the existing forms of money must be demonstrated practicable beyond question, long before custom and habit of the people can be changed; for they, more than ever before in the world's history, appreciate the importance to their welfare of honest money, and the oppression, robbery, distress and desolation which dishonest money carries in its train.

Late Deputy Assistant United States Treasurer.

Money, Coin. See COINAGE, AND NUMISMATICS.

Money, Paper, a money issue of a nation or government; a stamped sheet of paper, silk, linen, or parchment, given an official value and used as a medium of exchange. Although coins were used before paper money, the latter was known among the ancients. Corn, cattle, iron, leather, cocoa, shells, tobacco, and other commodities were all, in point of fact, used as money, in different ages and different countries; but they have long ceased to be so used, by commercial nations, for reasons similar to those which have induced men to choose for their standard of length some object less liable to variation than the foot of a chancellor, or the fore-arm of a king. The high estimation in which the precious metals have been held, in nearly all ages and all regions, is evidence that they must possess something more than merely ideal value. It is not from the mere vagaries of fancy that they are equally prized by the Laplander and the Siamese. It was not from compliance with any preconceived theories of philosophers or statesmen, that they were for many thousand years, in all commercial countries, the exclusive circulating medium. Men chose gold and silver for the material for money for reasons similar to those which induced them to choose wool, flax, silk, and cotton for materials for clothing; and stone, brick, and timber for materials for building. The scarcity of gold and silver, the need of bills of exchange, and the want of a money more convenient for the individual to carry, and lastly, the issuance of government credits forced on bankrupt nations, brought about the use of paper money in European countries, and Colonial America early adopted this medium of exchange from the English.

Provincial Paper Money.—In the earliest days of America, paper money was first issued by Massachusetts in 1690. The object was not

MONEY

to supply any supposed want of a medium for trade, but to satisfy the demands of some clamorous soldiers. Other issues were subsequently made, partly with a view of defraying the expenses of government, and partly with a view of making money plenty in every man's pocket. The ill-judged expedition of the Carolinas against Saint Augustine, in 1702, entailed a debt of 6,000 pounds on that colony, for the discharge of which a bill was passed by the Provincial Assembly for stamping bills of credit, which were to be sunk in three years by a duty laid upon liquors, skins, and furs. For five or six years after the emission, the paper passed in the country at the same value and rate as the sterling money of England. To defray the expenses of an expedition against the Tuscaroras, and to accommodate domestic trade, the legislature of South Carolina established a public bank in 1712, and issued 48,000 pounds in bills of credit, called bank-bills, to be lent out on interest on landed and personal security, and to be sunk gradually at the rate of 4,000 pounds a year. Soon after the emission of these bank-bills, the rate of exchange and the price of produce rose, advancing in the first year to 150, and in the second to 200 per cent. By the year 1731 the rate of exchange rose to 700, at which it continued with little variation upward of 40 years. In the year 1723 the province of Pennsylvania made its first experiment of a paper currency. It issued, in March, 15,000 pounds, on such terms as appeared likely to be effectual to keep up the credit of the bills. It made no loans but on land security, or plate deposited in the loan office; obliged the borrowers to pay 5 per cent for the sums they took up; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed sufficient penalties on all persons who presumed to make any bargain or sale on cheaper terms in case of being paid in gold or silver; and provided for the gradual reduction of the bills, by enacting that one eighth of the principal, as well as the whole interest, should be annually paid. These early specimens of provincial paper money were large notes, printed from copper-plates, having engraved borders on three sides. The inscriptions on the bills were in type, with arms or motto engraved in the left side centre. The signatures of the province officials were always signed in red ink.

Continental Money.—The first issue of paper money under the authority of the Continental Congress was dated 10 May 1775, but the notes were not actually placed in circulation until the August following. On 31 May 1781, the continental bills ceased to circulate as money, but they were afterward bought on speculation at various prices, from 400 for one, up to 1,000 for one. The value of continental paper was not the same in different parts of the country. The exchange was, for example, at 35 for one in New England, New York, the Carolinas, and Georgia, and at 40 for one in Pennsylvania, New Jersey, Delaware, Maryland, and Virginia. An account taken from the books of merchants in Virginia shows that the depreciation there regularly followed that in Philadelphia, though, toward the close, it sometimes lagged a month or more behind. Thus when exchange was in Philadelphia at 100 for one, in January 1781,

it was in Virginia at 75 for one. As late as May 1781, speculations were entered into at Philadelphia, to purchase continental money at 225 for one, and sell it at Boston at 75 for one. It is worthy of remark that the depreciation of continental money never stopped the circulation of it. As long as it retained any value at all it passed quick enough; and would purchase hard money or anything else, as readily as ever, when the exchange was 200 for one, and when every hope, or even idea of its being ultimately redeemed at nominal value had entirely vanished. The facility of raising ways and means, in the early part of the Revolutionary War, by issues of paper, led to much extravagance in the commissary department, and prevented the establishment of a sound system of finance. It is said that when a proposition was before Congress to establish a regular revenue system, one member exclaimed, "Do you think, gentlemen, that I will consent to load my constituents with taxes, when we can send to our printer and get a wagon load of money, one quire of which will pay for the whole!"

Connecticut.—Under date of 4 March 1762, Connecticut issued a series of colonial notes of the following values: 9 pence, 1 shilling, 2 shillings and 6 pence, and 10, 20, 30, and 40 shillings. There were 19 regular issues, the last being dated 1 July 1780. There were also three single bills in the nature of treasury notes, the last dated 26 Jan. 1791. Over 100 different bills were issued by this colony. The smaller values were for 2, 3, 4, 5, and 7 pence, issued 11 Oct. 1777. In Connecticut the 6 shilling bill was not infrequently raised by clever counterfeiters to the value of 10 shillings.

Delaware.—In this colony paper money was issued as early as 1735. One value only of these notes has been preserved to us, although doubtless many others were in circulation; the denomination is 10 shillings. The designs of the early issues are all about the same, a type body with a border of the same and wood cut of the royal arms. On 28 Feb. 1746, a new series was issued of the same general design, but noteworthy from having been printed by the celebrated Benj. Franklin and his partner D. Hall. On bills of this colony we first get the information that "To Counterfeit is Death," which is repeated in every possible form, "Tis death to counterfeit," "To counterfeit is death," "It's death to counterfeit this bill," "Death to counterfeiters," etc. The 2 shilling 6 pence bill of January 1776 issue is adorned with pillars, and probably to show that the edifice supported can stand any sort of usage, one is placed upside down. The last series issued, May 1777, contains bills from 3 pence to 20 shillings, and changed the cut of the royal arms for that of the State. Sixty bills emitted by this colony are known.

Georgia.—The earliest bill printed in Georgia was of the value of 2 shillings 6 pence, and was dated 7 March 1749. The Georgia bills were printed on one side of white paper and were usually made attractive by copper-plate vignettes printed in various colors. The vignettes represented figures of liberty, soldier, deer, hog, rattlesnake, palmetto tree, etc. The last issue was dated 16 Oct. 1786. There are over 110 varieties from 3 pence to 5 pounds.

Maryland.—The first bill of this colony is dated 1740 and of the value of one shilling.

MONEY

This was followed by a series of five values in 1748 and from then a regular succession of issues until their final extinction in 1781. The design of the early issues may be described as the arms of Lord Baltimore supported by two men in the costume of the day, one with a fish and the other with a spade. This is differently placed on the various bills. The lettering or form of contract is in the following words, "This indented Bill of Eight Dollars shall entitle the bearer to receive Bills of Exchange payable in London, at the Rate of Four Shillings and Six Pence Sterling per Dollar for the said Bill, according to Directions of an Act of Assembly of Maryland, Dated in Annapolis, this 1st day of January, Anno Domini 1767," followed, of course, by two signatures. The quaint idea of scalloping the end of a legal document to show that it has been prepared with due care and thought, and not cut off in a hurry, is carried out on these bills. In some values even the word "indented" is printed in a wavy line, and that there should be no mistake as to what is meant by a dollar, a minute representation of a Spanish dollar is inserted in the text. The values of the Maryland bills were 3, 4, 6 and 9 pence, and so on up to 3 pounds. There were over 100 varieties issued.

Massachusetts.—Prior to 1775, some 13 examples of paper money were issued in this colony. One of these is a copper-plate engraving said to have been the work of the noted patriot, Paul Revere, of Boston. The series was issued by order of the General Assembly of the Colony of Massachusetts Bay, 7 Dec. 1775. The reverse of these bills bears the figure of a man in continental dress, with a drawn sword in one hand and a copy of the Magna Charta in the other, above "Issued in defence of American Liberty," below in Latin, "He seeks by the sword calm repose under Freedom." The series of 16 Oct. 1776, repudiates the title of Colony for that of State. Coin must have become scarce, as more than half of the denominations are under 1 shilling. The codfish was the principal design on these bills. The next issue of eight values was of interest-bearing notes which are guaranteed by the United States. Upward of 135 bills were issued by Massachusetts.

New Hampshire.—The design of the New Hampshire bills was usually the British arms with inscriptions in elaborate frames. The earlier issues were type-set. About 60 varieties are known.

New Jersey.—The issues in this colony began in March 1724 and continued regularly to May 1786. In shape the bills were a small, narrow oblong. The high value notes were printed in blue and red. In 1781, the royal arms became the arms of the State, the type reading as follows: "State of New Jersey, Five Shillings, This bill shall pass for Five Shillings agreeably to an Act of the Legislature of this State, passed the ninth day of January, One Thousand Seven Hundred and Eighty-one." An entire collection of New Jersey bills would number 185.

New York.—The first bill issued was in 1709, and then followed a series of four dated 18 Dec. 1737. In the next issue the form reads "By a Law of the Colony of New York this Bill Shall Pass current for Three Pounds New

York the 20th April 1756." A set of United States guaranteed notes appeared 15 June 1780.

North Carolina.—The earliest notes were dated 1748, and upward of 120 varieties were printed up to 1780. The most of the North Carolina bills bore motto inscriptions, such as "Virtuous Councils the Cement of States"; "A Righteous Cause the Protection of Providence"; "A Lesson to arbitrary Kings and wicked Ministers"; "Liberty and Peace the Reward of Virtuous Resistance"; "Persecution the Ruin of Empires"; "Union of Hearts the Strength of Interests"; "American Virtue Triumphant," etc.

Pennsylvania.—The earliest known bill was dated 10 Aug. 1723, and was printed by Benj. Franklin. The general style of the notes is the same as used in Delaware, bearing the royal arms, or in 1756 those of Wm. Penn, with his motto, "Mercy Justice." In 1764 a curious notion was adopted of spelling the name of the colony differently on each bill, thus on the series we find Pennsylvania, Pensylvania, Pennsilvania, and Pensilvania. On some of the notes issued in 1771 is the signature of Francis Hopkinson, and on the bills of April of the following year that of John Morton, both signers of the Declaration of Independence. In 1777 the shape of the bill changes to the oblong form, and the arms of Pennsylvania take the place formerly devoted to those of Great Britain. This series are found both in black, and red with black type. In 1780 a set guaranteed by the United States, of the same design as issued for other States, was put in circulation, and on 16 March 1785, the last of the series saw the light, the denominations running from 3 pence to £4, 16 values in all. The varieties issued by this colony were over 250.

Rhode Island.—The paper money of Rhode Island was similar in design and value to that of Connecticut. The first issue was in 1715 and the last in 1786. There were about 75 varieties.

South Carolina.—There were various notes issued in this colony from 1712 to 1770. The bills dated 6 March 1776 were supposed to have the value of silver, equivalent in currency is given thus, 6 Spanish milled dollars = £9 15s. currency. In 1779 appeared the handsomest notes heretofore used in the country, the backs of the \$50, \$70 and \$90 bills representing Atlas, Prometheus and Hercules being especially noteworthy. The total number of bills for South Carolina was 105.

Vermont.—In this colony there were but two series, the first issued in February 1781 is an ordinary type-printed note, with engraved border on three sides with the state seal about the centre. This consists of a pair of scales and a chain of fourteen links (the only instance where the number is carried above the original thirteen) enclosed in a circular band inscribed "Vermont Calls For Justice." The second issue are in the form of treasury notes, the amounts being filled in with ink.

Virginia.—The first issue for this State was in 1755. The notes are of two varieties, the first a fine, large bill after the English style, and then something between a draft and a bank-bill, being probably made to fill a pressing want. The bills are copper-plate engravings filled out in ink. On the issue of 1775 are the royal arms of Virginia in an engraved frame. The lettering reads, "Three Pounds Current Money of Virginia Pursuant to Ordinance of Convention

MONEYWORT—MONGE

Passed 17 July 1775." The following year introduces the "sic semper tyrannis" in place of the arms.

Bank Notes.—From the Revolutionary period to the days of the Civil War and to the present time, many issues of paper money have been made by the government, and by national, state and local banks. (See BANKS AND BANKING.)

Confederate Paper Money.—During the Civil War the Southern States in secession issued millions of dollars in paper money, beginning in July 1861, with bills of from \$5 to \$100. On these were designs of the Confederate flag, a train of cars, cotton bales, etc. In September 1861, appeared at least 50 varieties of bills in value from \$5 to \$100. They were of various designs. A \$20 bill showed a head of Alexander H. Stephens in one corner; a \$10 bill pictured General Marion offering a breakfast of sweet potatoes to a British officer. Portraits of Davis, Hunter, Memminger, Stephens, Mrs. Pickens, Mrs. Davis, Benjamin, Gen. Jackson, and others, appeared on the high value notes. There was an issue of \$1 and \$2 bills in 1862 and in April 1863, appeared a series in value from 50 cents to \$100. Some of these bore designs of the capitol buildings at Richmond, Nashville, Montgomery, etc. The last issue of bills from 50 cents in value to \$500 appeared 17 Feb. 1864.

Postal Currency.—The United States government printed a paper money as a substitute for fractional currency during the Civil War, owing to the scarcity of silver. This was invented by General Spinner, United States Treasurer under Lincoln, and was commonly known as "shin-plaster" money. The issue was in small scrip of the denominations of 3, 5, 10, 25 and 50 cents. It disappeared from general circulation about 1870.

Greenbacks, Silver and Gold Certificates.—The more recent issues of American paper money in circulation at the present day are printed at the Bureau of Engraving and Printing at Washington. The engravers are specialists, and the figures and intricate designs of their work are often marvels of artistic skill. Portraits of living persons are never put on the notes, and all the figures, vignettes, borders, etc., are engraved separately before they are put on the plates. First the engraver works out his design, and after transferring it by hand to a plate of soft steel the plate is hardened and a soft steel roller takes the impression from it. After this roll is chilled another impression is taken on another steel plate, and after this latter has been hardened it is ready for use. The geometric lathe which makes the border is a complete and wonderful piece of mechanism. The lines for the borders, backs and other conventional designs seen on the notes are made by this machine. The paper for printing the bank-notes is manufactured under the supervision of government officials. It has two perpendicular lines of short, uneven silk threads running through it.

Foreign Paper Money.—The notes of the Bank of England are 5 by 8 inches in dimensions, and are printed in black ink on Irish linen water-lined paper, plain, white, with ragged edges. The notes of the Bank of France are made of white water-lined paper, printed in

blue and black, with numerous mythological and allegorical pictures. South American currency is about the size and appearance of the American. The German notes are printed in green and black. The Chinese paper money is in red, white and yellow, with gilt lettering and various devices. Italian notes are printed on white paper in pink, blue, and carmine, and ornamented with a vignette of King Humbert.

Editorial Staff, 'Encyclopedia Americana.'

Mon'eywort, Creeping Charley, Creeping Jenny, or Herb-twopence, are popular names for *Lysimachia nummularia* of the primrose family. The plant, which is a native of Europe, is a perennial with roundish leaves and axillary flowers borne from early summer until autumn. It is very popular for planting in rockeries, vases, hanging-baskets and shady situations, and has become naturalized in the eastern United States. Propagation by seeds or cuttings is very simple, and the plants seem to thrive in any moist, shaded garden soil, cool greenhouse, or window. Several other plants are sometimes called moneywort; for example, *Anagallis tenella*, *Dioscorea nummularia*, and *Thymus chamadrys*. See LOOSESTRIFE.

Mon'fort, Francis Cassatt, American Presbyterian clergyman: b. Greensburg, Ind., 1 Sept. 1844. He was graduated from Wabash College in 1864, studied theology and after entering the ministry held Presbyterian pastorates in Cincinnati, 1869-88. Since 1873 he has been editor of the 'Herald and Presbyter.' He has published 'Sermons for Silent Sabbaths' (1887); 'Socialism and City Evangelization' (1887); 'The Law of Appeals' (1893); 'Ecclesiastical Discipline' (1900).

Monge, Gaspard, gäs-pär mônzh, French mathematician and physicist: b. Beaune, France, 10 May 1746; d. Paris 18 July 1818. He was educated at Beaune and Lyons and at 16 was a teacher. He made rapid progress and some valuable discoveries in engineering, and in 1783 was called to the professorship of hydrodynamics in the Paris Lyceum. He was a supporter of the French Revolution, became minister of marine and was temporary minister of war and one of the signers of the death warrant for Louis XVI. He resigned soon after the king's death and was engaged in manufacturing arms and gunpowder for the army. He founded the Ecole Polytechnique under the Directory and was professor of mathematics there, but was later sent to Italy to assist in the removal to France of the art treasures captured by French armies, and there gained the friendship of Napoleon whom he accompanied to Egypt in 1798, continuing his scientific researches. He resumed his position in the Ecole Polytechnique upon his return to France and in 1805 was elected senator. Napoleon gave him an estate in Westphalia, and the title of Count of Pelusium, but the downfall of the emperor resulted in reverses for Monge who was expelled from his positions in 1815. He published: 'Traite élémentaire de Statique' (1788); 'Leçons de Géométrie Descriptive' (1795); etc. Consult: Dupin, 'Essai Historique sur les Services et les Travaux Scientifiques de Monge' (1819); Obenrauch, 'Monge der Begründer der darstellenden Geometrie als Wissenschaft' (1893-4).

MONGHYR—MONGOLIA

Monghyr, mōn-gēr', or Monghir, India, the capital of a district in the Bhagalpur division of Bahar, Bengal, on the right bank of the Ganges, 80 miles east of Patna. It communicates by a steam ferry with its railway depot on the opposite bank. It is of great antiquity, and has an elevated fort, enclosing the district administrative offices. Monghyr still enjoys a local reputation for its former important manufactures of swords, firearms and hardware. Pop. (1901) 35,883.

Mongolia, Asia, a vast central and eastern region belonging to the Chinese empire, between lat. 35° and 52° N., and lon. 82° and 123° E., bounded on the north by Asiatic Russia, east by Manchuria, south by China proper, and west by Sungaria and East Turkestan; estimated area, about 1,300,000 square miles.

The central portion, nearly a fourth of the whole, is occupied by the Desert of Gobi, an extensive sandy plateau, with a few spots of pasture and brushwood. Other parts are intersected by lofty granitic chains, the principal of which are the Altai, the Thian-shan, the Khinghan, and the In-shan. The largest rivers are—in the north the Salenga, and in the south the Siramuren. The climate presents the opposite extremes of intense winter cold and summer heat. Agriculture is but little developed, and that only in the south on the borders of China proper; cattle raising, a few domestic industries, and the transporting of goods are the chief occupations of the inhabitants. There is a considerable transit trade with Russia and China; the principal commercial centres are Kuku-Khoto, Kalgan, Biru-Khoto, Dolon-nur, and Kuku-erghi, in southern and southeastern Mongolia; Kerulen in the northeast, Kobdo, Ulasutai, and Urga in the northwest. The population is estimated at about 3,000,000, divided into tribes chief of which are: (1) the Khalkas, or Mongolians properly so called, who occupy the entire north of Mongolia; (2) the Ouryantai and the Darkhat, who are Mongolized Turks; (3) the Ordos of pure Mongolian blood; (4) the eight tribes of the Tsaktar, of Mongolian blood.

The Khalkas are divided into four "aimaks," or principalities, the creation of which, it is said, dates back to Genghis-Khan. These are Toucheton, Tsetsen, Sain-Noin, and Tsatsatkou. Each aimak is divided into "hoshuns," which are subdivided into "sumuns." Such distribution of the territory is very ancient.

Although the Mongolians are vassals of China they govern themselves. In each administrative subdivision there is elected a chief, whose election is ratified by the Chinese government, and who receives from Peking a title of honor of slight importance, along with a button or peacock's feather for his cap. At Osuga, the Mongolian prince in charge (theoretically) of the administration of the affairs of the Khalkas has for adjunct (theoretical) a Manchu envoy, the "ambane," who is really the master of the situation; and the decisions made in common (or that are supposed to be) by the two exalted persons are those dictated by the ambane, that is to say, the Peking government.

The Khalkas are nomads, but only relatively so. Within the limits of their hoshun and sumun they periodically shift their quarters in search of "pastures new" for their herds, but

they never travel very far, and it is always possible to find an encampment within a radius of a few miles.

They live under the "yourte," which consists of a light circular framework covered with pieces of felt. The form is that of a dome supported by a small sub-basement, and about 10 feet in height. In order to render it habitable, it suffices to cover it with pieces of felt and close the central orifice above with a movable piece of the same material. Through this orifice the smoke of the "*pot à feu*" escapes. The fire place is situated in the centre of the abode, the household gods are placed opposite the door, and the housekeeping utensils are arranged along the walls. Around the fireplace are spread out, in lieu of seats, pieces of felt, for which the well-to-do substitute carpets. The princely yourtes are furnished with board floors and decorated with silken hangings.

In summer the men wear wide trousers and a shirt of calico, in most cases blue. Over this they place a long robe, which is buttoned upon the shoulder and side. This is of blue or brown cotton, but sometimes of red or dark green silk. The lamas, or church people—the religion being Buddhism—affect yellow. This robe is gathered in at the waist by a cloth girdle whence, to the right, hangs a knife, and to the left a tobacco bag and tinder box.

Boots with pointed upturned toe and high heel, generally of red leather with a thick sole, complete the accoutrement. The fact that the Mongolian shoemakers make but one size of footgear explains why the son can wear the boots of his father, and why the Mongolian (who also is naturally lazy) does not like to take even the shortest walks afoot. He bestrides his horse in order to travel a distance of a hundred paces, and it is only during the coldest weather that he decides to dismount from his steed in order to walk half a mile or more.

The Mongolians shave and wear a cue. The headgear or national hat consists of a small cone of figured silk or damask, which forms the skull-cap. The rim, which is of black velvet, is turned up so as to describe an acute angle with the central cone. Behind, float two long wide ribbons, which are invariably of red silk. The button or the tuft that crowns the cone is likewise always red. When it rains (a rare event in the Khalka country) the velvet rim is turned down, and the hat assumes the form of an extinguisher that protects the ears and neck. In winter, these hats are replaced by a headgear trimmed with fur, squirrel among the poor, and sable among the rich, the change of hat is accompanied with a change of costume. The long cotton or silk tunic is replaced by a mantle of sheep or deer skin, or among the rich, by a long coat of silk trimmed and lined with costly fur.

The majority of the Mongolians are thin and emaciated. Although they are not strong, they are wiry and capable of withstanding considerable fatigue on horseback. But they object to muscular work. It takes two or three to lift a weight that could be easily handled by one Cossack. To the European eye, they are, with their broad, flat noses, their high cheek-bones, and their little, beady eyes, intensely ugly. They are generally of a low stature, and sometimes have a certain nobility of countenance. Almost

all have a kind, benevolent expression to which one soon becomes habituated.

In their youth, the women are very prepossessing. Their lineaments are refined, their eyes languishing, and their faces plump and smiling like those of the Japanese. They wear the same underclothing that the men do; the same boots and the same hat. But the married women wear a long tunic with very narrow sleeves that are generally red from the middle of the arm to the wrist, which is covered by a small point of the sleeve, if the latter is not rolled up. The robe may be blue, brown, violet, or red, but the sleeve is always red. Above the shoulder the sleeve is padded to a considerable height. A tucker of this same red color covers the top of the throat.

Maidens, whose robes resemble those of men, wear their hair in a single braid hanging down the back. The children go about bravely in *puris naturalibus*, during the summer season, and it is not till they have reached the age of 10 that they are clad in the long national tunic.

The name of the Mongolians became suddenly known in the 13th century, and the world was soon filled with the narratives of the exploits of these nomad warriors. The celebrated chief known to history as Jenghis-Khan (or Genghis-Khan) was born probably in 1162. By his ardor, courage, and successes, he grouped around him a band of young warriors, took part in a number of wars between the Chinese and Mongolians, fighting now on one side and now on the other, subjugated all the tribes living between Irtych and the Khingan Mountains, and in 1206, at the diet of the Mongolian nobles that he had assembled, received the title of Jenghis-Khan, or "the most powerful prince," under which he was to be known to posterity. Marching from conquest to conquest, he soon became master of the southern provinces of China, and in 1210 made himself master of Bokhara and Samarkand. Seven years later, he died, while his army divided into three parts, one of which marched against Afghanistan, another against Russia, and the third completed the conquest of China.

In 1237 the whole of Russia, except Novgorod, was paying tribute to the Mongolians, who next invaded Poland and Silesia, and finally Moravia and Hungary. At this period the power of the Mongolians was at its apogee; but, at the end of the 13th century, it declined, and in 1368 these people were driven from China, and the prince who had occupied the Chinese throne returned to the steppes of the north, with his vassals, where he reigned over his fellow countrymen only. A century later, the Mongolians were beaten and dispersed by the Russians, who had been their vassals for two centuries.

Subsequently, the Khans of southern Mongolia acknowledged themselves vassals of the emperor, Son of Heaven, the "Bogdo-Khan." Northern Mongolia, that is to say, the country of the Khalkas, divided into four principalities, remained independent for a longer time, but in 1691 placed itself under the protection of the emperor of China.

Consult: Gilmour, 'Among the Mongols' (1883); Pozdnéef, 'Towns of North Mongolia' (1880); 'Mongolia and the Mongols' (1896-9); Prjevalsky, 'Mongolia and the Land of the Tanguts' (1875-1883-1888).

Mongo'lian Race, a general name applied to a majority of the people of Asia. In ethnology, the term is used for one of the five great races of the world discriminated and named by Blumenbach, and adopted by Cuvier when he reduced Blumenbach's five to three. The head of the Mongolian is square; the face flattish, nearly as broad as long, the parts not well distinguished from each other; the eyelids narrow, obliquely turned up at their outer angle; the space between the eyes flat and broad, the nose flat, the cheeks projecting, the chin somewhat prominent. The hair is straight, the color black, that of the face and body yellowish (sometimes inaccurately called olive, which implies an admixture of green). The race includes not merely the natives of Mongolia properly so called, but the Tartars, the Chinese, the Japanese, the Cochinese, the Burmese, the Tamuls, the Turks, and the Finns.

Mongolian Subregion. In zoogeography, a subdivision which includes the tablelands of central Asia, from the Caspian Sea to Japan. Its separation from other Asiatic faunal regions is mainly on ornithological grounds, and is neither distinct nor important.

Mon'goose, Monguse, etc. See MUNGOS.

Mon'ica, Saint, mother of Saint Augustine (q.v.): b. Africa 332; d. Ostia 387. A Christian who, in accordance with the wishes of her parents, also Christians, married a pagan. She devoted nearly all her life to the conversion of her husband and son Augustine. Her self-sacrifice was at last rewarded; her husband, Patricius, became a Christian, and Augustine, seeing the error of his ways, reformed. After the baptism of Saint Augustine at Easter, 387, she set out with her two sons for Africa. Arriving at Ostia she became ill and here died. A friend asked her in Ostia if she were not afraid to be buried in a place so far from her own country. She replied: "Nothing is far from God." Her eminent son preserved many of her holy sayings which he often repeated in his sermons. In the Roman Catholic Church she is regarded as the model and patroness of wives and mothers. Her feast is 4 May. Consult: 'Saint Augustine's Works' edited by Tillemont; Butler, 'Lives of the Saints.'

Monier-Williams, mó'ní-ér-wíl'yamz, **SIR** Monier, English Sanskrit scholar: b. Bombay 12 Nov. 1819; d. Cannes, France, 11 April 1899. He was a son of Monier-Williams, surveyor-general. He was educated at Oxford, and was for a short period a student at the East India College, Haileybury. He was professor of Sanskrit at Haileybury from 1844 to the extinction of the college in 1858, and in 1860 became Boden Sanskrit professor at Oxford, a post which he held till his death. Among his numerous works are: 'Practical Sanskrit Grammar' (1846); 'English-Sanskrit Dictionary' (1851); edition with notes, translations, etc., of the Sakuntalā (1853); 'Introduction to Hindustani' (1858); 'Indian Epic Poetry' (1863); 'Sanskrit-English Dictionary' (1872, 2d edition 1899); 'Indian Wisdom' (1875); 'Hinduism' (1877); 'Modern India and the Indians' (1878); 'Religious Life and Thought in India' (1883); 'The Holy Bible and the Sacred Books of the East' (1886); 'Brahmanism and Hinduism' (1889); 'Reminiscences of old Haileybury College' (1894). He traveled extensively

MONISM—MONITOK

throughout India in order to study the native religions, and to further his scheme of an Indian institute, which he succeeded in getting established at Oxford.

Monism, a philosophical term which may be briefly translated by "doctrine of unity." (See **DUALISM** and **PLURALISM**.) The word was coined by Christian von Wolff, a German philosopher of the first half of the 18th century, and is derived from the Greek *monos* which means "single; alone; lonely; unique; existing in only one copy." Wolff, the inventor of many happy terms that acquired currency in philosophy, introduced the word to characterize such philosophies as recognize the existence of one ultimate form of reality only, be it spirit or matter, and he contrasted it with "dualism," that is, the doctrine of duality, held by all those thinkers who believe that both spirit and matter are ultimate forms of existence. Kant had been raised in the school of Wolff's dogmatism and adopted his nomenclature but did not use the word "monism," and so it happened that the term remained dormant for more than half a century. Besides there was no one who would label his own views as monism, as defined by Wolff.

However, the better the interconnection of all things began to be understood, the more was the idea of unity appreciated. A new term was needed and the word "monism" was too expressive to remain neglected. Kant had left a method, but his successors endeavored to work out systems of philosophy, and everyone of them tried to discover the oneness of existence in his own way. Fichte established it in his doctrine of the all-sufficiency of the ego by showing that the objective world is derived from the ego and is in part the expression of the nature of the latter, and in part the necessary condition of its realization and development. Thus Fichte makes the assumption that the subject is the one and the all. Schelling tried to avoid Fichte's error and founded his theory of oneness upon the identity of the subject and the object. Hegel, however, discovered the unity of the world in the object in itself which was neither the object nor the subject, but a higher third power which he called the Absolute, manifesting itself according to its own laws in the phenomenal world of both subject and object. Hegel's philosophy was characterized as monism, and he pointed out how all thought consisted in the search for a higher unity in a contrast of two opposites.

The word "monism," however, began to be prominently applied at the time when Darwinism gained the ascendancy, and now the naturalists among the philosophers, men strongly influenced by Spinoza, who denied any special revelation and rejected the dualism implied by the belief in a miracle-working extra-mundane creator, adopted the name as an appropriate description of their own views. Spinoza's philosophy was praised by them as a consistent monism, and most of them assumed with their master (Spinoza) that there is one substance only and that this one substance manifests itself in two modes of existence, as thought and extension.

Modern psychology is built upon Spinoza's conception of the correlation of thought and extension. It conceives of subject and object, of soul and body, of spirit and matter, of feeling and motion, as a contrast based upon an ultimate

unity. From this principle Weber and Fechner developed their theory of parallelism which was further elaborated by their successors and was brought to a relative completion by Wundt. In England Prof. W. K. Clifford gave it a classical expression in his essay on the 'Nature of Things in Themselves.'

In this way monism gradually acquired the repute of denoting a philosophy that, as a matter of principle, was in strict harmony with scientific methods, and thereby the meaning of the word was again slightly changed; for it denoted no longer a "one substance theory" but any philosophy that in one way or another sought to establish an ultimate unity of some kind. Thus, Prof. Haeckel's monism is a naturalism according to which there is no other reality but matter and energy. Du Prell designates by the same term his spiritualistic world-conception, according to which spirit is the only true existence and matter is, if not practically, yet theoretically, eliminated. Prof. Ludwig Noiré's monism is Darwinism applied to philology. His ingenious "Logo-theory" concerning the origin of human speech is based on the maxim that man thinks because he speaks, not *vice versa*. Prof. Max Müller who also calls himself a monist, follows Noiré closely in his monistic interpretation of reason and boldly proclaims the theory of "the identity of language and thought" but shrinks from drawing the last consequence of Darwinism as to the descent of man. The writer understands by monism, "a unitary world-conception" and defines its underlying principle simply as "consistency." To him monism is identical with a genuine positivism (a philosophy built upon the facts of experience) and may briefly be characterized as "the philosophy of science." It is the aim of philosophy to justify the methods of science that everywhere lead to the conception of oneness. All truths must agree; there may be contrasts, but there cannot be any contradiction in truth. Any dualistic conception indicates that there is a problem to be solved and the establishment of monism is everywhere the final aim of all science. Consult: Bradley, 'Appearance and Reality' (1897); Hobhouse, 'Theory of Knowledge' (1896); Avenarius, 'Der menschliche Weltbegriff'; Romanes, 'Mind Motion and Monism.'

PAUL CARUS,
Editor of 'The Monist.'

Moniteur, mô-nê-têr, Le, French journal, established 5 May 1789 by Panckoucke under the name 'Gazette Nationale, ou le Moniteur Universel.'

Monitite. See MONETTE.

Monitor, The, an ironclad, the first of a class of naval vessels designated as monitors (see WARSHIPS). It was designed and built for the United States government in 1861-2 under direction of the engineer John Ericsson (q.v.), who adopted as the most essential feature of its construction the revolving gun-turret devised by the American inventor Theodore Ruggles Timby (q.v.). The Monitor was launched at Greenpoint, L. I., 30 Jan. 1862, only 100 days after the laying of her keel. She put to sea 6 March following, under command of Lieut. John L. Worden (q.v.), arriving on the night of the 8th at Hampton Roads, Va. Extraordinary energy had been displayed by the builders to meet a grave emergency of the gov-

MONITOR AND MERRIMAC

ernment, then weak in naval resources, for making effectual the blockade of Southern ports which President Lincoln had proclaimed, as well as for aggressive action and coast-defense. This emergency soon became a dire peril which threatened the destruction of the Union through superior sea power acquired by the Confederacy with foreign aid or connivance. How this danger was first averted is shown in the account of the famous action in Hampton Roads (see MONITOR AND MERRIMAC).

Extreme length	172 ft.
Extreme breadth	41 ft. 6 in.
Depth of hold	11 ft. 4 in.
Draft	10 ft. 6 in.
Inside diameter of turret	20 ft.
Height of turret	9 ft.
Thickness of turret	8 in.
Thickness of side-armor	5 in.
Thickness of deck-plate	1 in.
Diameter of propeller	9 ft.
Diameter of steam cylinders (two)	36 in.
Length of stroke	2 ft. 2 in.
Displacement	1,255 tons
Armament, two 11-in. shell-guns, each 15,668 pounds.	

Theodore R. Timby's Model sent to China by Caleb Cushing in 1843, which suggested to J. Ericsson the Low Freeboard.

The Monitor was built by a company of men, John F. Winslow and John A. Griswold of Troy, N. Y., and their associates, who were actuated by patriotic motives. With T. R. Timby, who had taken out patents "for revolving towers for offensive or defensive warfare whether placed on land or water," they entered into a contract for the use of his inventions covering the revolving turret, paying him \$5,000 as royalty on each turret constructed by them. They built the Monitor at their own risk, Winslow and Griswold furnishing 90 per cent and C. S. Rushnell of New Haven, Conn., 10 per cent of the cost. Ericsson, for his services as engineer, received 5 per cent of the gross sum paid to the company for the Monitor and kindred vessels built by them. A contract with the government was made by the company and Ericsson, and the government paid for the Monitor \$275,000, the actual cost being \$195,000.

Ivory model of the turret made by T. R. Timby in 1841; now in possession of the Patriotic League of the Revolution.

The contract with the government provided for the building of "an iron-clad, shot-proof steam battery of iron and wood combined," and the hull of the Monitor was of iron with wooden deck-beams and side-projection. Her dimensions were:

Vol 40-46

In all the models, drawings, and plans of his invention made by T. R. Timby himself, the pilot-house or "lookout" was placed on top of the turret. "For some inexplicable reason," he has said, "the Monitor had her pilot-house placed upon the deck, forward of the turret, in the way of her own guns."

The success of the Monitor aroused much interest in all maritime nations, and was the direct cause of many modifications in the construction of vessels in the navies of Europe, though nowhere except in the United States navy was the monitor adopted as a distinct type of warship. During a gale off Cape Hatteras 31 Dec. 1862, the Monitor was sunk.

JOHN H. CLIFFORD.

Monitor and Merrimac. The contract for the construction of the Monitor was entered into by the Navy Department in the hope that she could be completed before the Merrimac, then building by the Confederates at the Norfolk Navy Yard, could be finished, and that the Monitor would be able to cope with this formidable ironclad. The Merrimac, called by the Confederates the Virginia, was being reconstructed upon the hull of the United States frigate Merrimac, of 3,200 tons, which had been sunk, when the Norfolk Navy Yard was abandoned, by the Union forces, and was subsequently raised by the Confederates. Her armament was two 7-inch rifles, two 6-inch rifles, and six 9-inch smooth-bores.

Each side was aware of the effort of the other to be first ready for active service. The Confederates won by a day. At noon 8 March 1862, the Merrimac, attended by two gunboats, Raleigh and Beaufort, each one gun, was discovered coming out of the Elizabeth River into Hampton Roads (q.v.) and standing toward the Union fleet off Newport News and Fort Monroe, composed of the steam-frigates Minnesota, Roanoke, and Congress, each 50 guns; the sailing-frigate

MONITOR LIZARD

St. Lawrence, 12 guns; and the sloop Cumberland, 24 guns. Their armament was mainly 8-inch and 9-inch guns, with several 10-inch pivot guns. These vessels had the heaviest batteries which the government had been able to assemble to watch the Merrimac. The latter bore down directly upon the Congress and Cumberland. At less than a quarter of a mile the Congress delivered her broadside, her heaviest shot making no impression. The return-fire of shells crashed through her sides with terrible effect. Passing the Congress at 300 yards, the Merrimac received the fire of the heaviest guns of the Cumberland without the slightest harm resulting, and without replying she drove her iron prow through the side of the Union frigate, crushing it, and at the same time pouring in a fire of shells. Leaving the Cumberland rapidly sinking, the ironclad steered for the Congress, which had been run ashore, and from a point 150 yards astern raked her decks with shells which caused general destruction and set the ship afire. The Congress was obliged to surrender. The Cumberland fired a broadside as the water reached the gun-deck, and went down with her flag flying. As she sank, the Confederate steamers Patrick Henry, 12 guns, and the Jamestown, two, came out of the James River and joined the Merrimac. The Minnesota had grounded where the Merrimac could not approach within a mile, and her firing was so bad that only one shot struck the frigate. The other Confederate vessels were finally driven off after inflicting much damage with their rifled guns. After several hours' ineffectual attempts to reach the Minnesota, the Merrimac and attending gunboats returned to Norfolk. Several shore-batteries which had attempted to help proved as useless as the batteries of the frigates had been. The Congress continued to burn, and finally blew up. Over half the crew of the Cumberland were lost. The crew of the Congress were made prisoners, but, with the exception of the officers, were released. The total loss was some 250, the Confederate loss was nominal. The battle of an afternoon had ended the day of wooden navies.

The reports of the destruction by the Merrimac caused consternation at Washington, and in the coast cities and, indeed, throughout the North. Secretary Stanton ordered all preparations made for obstructing the channel of the Potomac far below the capital, and warned those in charge of coast-defenses to use every means that could be devised for protection.

Meantime the Monitor, in command of Lieut. John L. Worden, had left New York and after a rough voyage, entered Hampton Roads at 9 o'clock the night after the battle. At 2 o'clock on the morning of the 9th she had anchored alongside the Minnesota. At 6 o'clock the Merrimac appeared bearing down on them, but at first passed by, gained the channel in which the Minnesota lay, and then steamed directly toward her. The Monitor swept in between the two and steered for the Merrimac. At close quarters the latter brought her bow-guns to bear and missed. There was little to fire at except the low turret with a cross-section of 20 feet. The first reply of the Monitor was a solid 11-inch shot which shook the Merrimac from stem to stern. The answer was a broadside, some of the shot of which struck the turret, either glancing or falling as harmless as the shot of the frigates the day

before had proved against the Merrimac. Then followed broadside after broadside without producing the slightest effect on this "cheese-box on a raft," as spectators described it. At every opportunity of maneuver the Monitor closed in and smote with her 11-inch solid shot, bending the heavy armor and straining the timbers of her adversary. Finally the Merrimac left the Monitor and crowded steam for the Minnesota. Upon reaching point-blank range she received a full broadside, and a shot from a 10-inch pivot-gun, without suffering the slightest damage. In reply she raked the Minnesota with a shell, set her afire, blew up a tug alongside, and but for the Monitor, which had followed under full steam, and now swept in between the two, the Minnesota would have shared the fate of the Congress and Cumberland. In changing position to meet the Monitor the Merrimac grounded, and the Monitor continued her hammering with 11-inch shot. As soon as the Merrimac was floated she started rapidly down the bay, pursued by the Monitor. Suddenly she turned and attempted to run the Monitor down. The blow she struck with her prow glanced, and the Monitor was unharmed. The Merrimac then started for the Minnesota for the purpose of ramming her; but when within easy range the Merrimac, with all the Confederate ships, changed course at noon and headed for Norfolk. Her officers subsequently gave as a reason that in attempting to ram the Monitor her iron prow was broken, and their vessel was leaking. The armor was reported damaged, the stem twisted, the muzzles of two guns shot away, and the steam-pipe and smokestack riddled. The casualties were only two killed and 19 wounded. The consternation of the day before at Washington and the North was transferred to Richmond and the South. Preparations were hastily made by the Confederates for blocking the channels in the Elizabeth and Nansemond rivers, and to obstruct the channel of the James.

The Merrimac did not again engage the Monitor, and after the evacuation of Norfolk, which occurred 9 May, she was destroyed by the Confederates.

The Monitor had hurried direct from her shipyard to Fort Monroe and fought without a previous trial-trip, and before she had been accepted by the government. Her five hours' battle settled many questions, and once again in American history had been fired a "shot heard round the world."

H. V. BOYNTON.

Monitor Lizard, the type of a family of pleurodont lizards (*Varanidae*), allied to the typical lizards (*Lacertidae*). They are found in Africa, the Eastern Archipelago, etc., and are the largest of modern lizards, some species attaining a length of 6 or 8 feet. The skin shows little appearance of scales. The tail is long, cylindrical in the terrestrial, but compressed laterally in the aquatic forms, and possesses a sharp under ridge or keel. The limbs are well developed, and the toes provided with claws. Most of these great greenish-gray lizards inhabit rivers and ponds, and are active and fierce enemies of all lesser aquatic life. They feed upon the eggs and young of crocodiles, turtles and aquatic birds; and on fishes, amphibians, swimming-birds, anything, in fact, small enough to be mastered. The most familiar species, probably, is that of the Nile and other African rivers

MONITORIAL SYSTEM—MONKEYS

(*Varanus niloticus*), upon which the English name "monitor" was first fastened by a ridiculous misinterpretation of the Arabic word *ouaran* (lizard); it is aquatic and frequently exceeding five feet in length. An equally well known kind is the East Indian monitor (*V. salvator*), which is to be met with from Ceylon and Western India to the Philippines, and is equally at home in the water, on land or in trees. Its rapacity is great and varied; and it is connected with many extraordinary rites and superstitions among the natives, some of which are given in Fennet's 'Sketches of the Natural History of Ceylon' (1861). Australia has a large species (*V. gouldi*).

Monitorial System, or Mutual Instruction, in education, a plan to employ the more advanced boys in school to instruct the younger pupils. The method first occurred to Dr. Andrew Bell, when superintendent of the Orphan Hospital, Madras, in 1795, and was eagerly adopted by Joseph Lancaster, who in the first years of the 19th century did so much for the extension of popular education; and, from him and the originator, the system was called indifferently the Madras and the Lancastrian as well as the Monitorial or Mutual System. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organizing schools, and of providing the necessary teaching power. See EDUCATION.

Monk, münk, or Monck, George, DUKE OF ALBEMARLE, English general: b. Potheridge, Devon, 6 Dec. 1608; d. Newhall, Essex, 3 Jan. 1670. At 17 he enlisted and served in the Cadiz expedition under Sir Richard Grenville, a relative; then entered the Dutch army; and returned to England in 1639, fought brilliantly in Scotland and after 1640 in Ireland, and on the outbreak of the civil war kept his commission in the king's army. But in 1644 he was captured by the Parliamentarian forces, and after two years' imprisonment in the Tower, joined the victors, for whom he went to Ulster as governor. Accused of exceeding his powers by arranging a truce (which was almost an alliance) with Owen O'Neil, he was recalled to England in 1649 and reprimanded at the bar of the House of Commons. At the victory of Dunbar in 1650 he did good service; a year later he was made lieutenant-general of the ordnance and in Cromwell's absence was commander-in-chief of Scotland. In 1652 he was made a general of the fleet. He introduced the elements of land tactics into naval formation and administered two crushing defeats to the Dutch, van Tromp being killed in the latter battle. In 1654 he again was sent to Scotland on the Royalist rising as commander of the army, and acted there with much prudence and success. After Oliver's death and Richard Cromwell's resignation Monk set himself to effect the Stuart Restoration, quietly shifted the forces in England until all was so arranged that there was no chance of armed resistance, and then (1660) brought back Charles II.—a bloodless revolution meeting with general favor. He was made Duke of Albemarle, received other high honors, maintained order and showed rare courage in London during the Plague, but with an empty treasury in 1667 could not keep the Dutch from burning the shipping in the Thames. Short, fat, fair, and wrinkled, Monk was not

a winning personality, being cold, prudent past a virtue, and rather unprincipled; but he was a wonderfully able general, with technical skill rare in one so lacking in theoretical training. His life was written by his chaplain, Dr. Thomas Gumble (1671). Consult also the biographies by Guizot (1838 and 1850); and that by Cobett (1889) in the 'English Men of Action' series.

Monk, Maria, Canadian impostor: b. about 1817; d. 1850. She attained notoriety in 1835 when she came to New York, stated that she had just made her escape from the Hôtel Dieu Nunnery, Montreal, and told most shocking details of convent life. She wrote 'Awful Disclosures' and 'Further Disclosures' in 1836; aroused a strong anti-Catholic movement, the American or "Know-Nothing" party especially using her story for political purposes; but was exposed and proved an impostor by William L. Stone in his book 'Maria Monk and the Nunnery of the Hôtel Dieu' (1836).

Monk, a bird. See FRIAR-BIRD.

Monk. See MONASTICISM.

Monk-fish, Angel-fish, or Fiddle-fish, a broad, flattened fish (*Squatina angelus*), closely allied to the sharks, but more like a ray in appearance, 5 or 6 feet long, having enlarged, wing-like pectoral fins. It is found near the coast in the warm seas of Europe and North America; it usually stays near the bottom, is from three to four feet long, slow in motion, dull, voracious and useless, except that some shagreen may be obtained from its skin.

Monk-seal, a seal of the genus *Monachus*, so called from a humorous suggestion in its colors to the habit of a monk, the species properly so called is that (*M. albigenter*) of the Mediterranean; but the West Indian seal (*M. tropicalis*) is very similar to it, and is of interest as being almost extinct.

Monkey-bread, the fruit of the baobab-tree (q.v.).

Monkey-flower, any of many plants of the genus *Mimulus* (figwort family), so called because the face of the fox-glove-like corolla suggests that of a cheerful monkey. They are erect, tall herbs, with opposite, clasping, lanceolate dentate leaves, which bear in late summer solitary, axillary irregular blossoms of showy colors. The genus contains some 50 North American species, of which the most familiar is the square-stemmed of the eastern and central States (*M. ringens*). Its flower is violet. A common species on the Pacific coast (*M. guttatus*) has the corolla yellow, often blotched with red or purple.

Monkey Pot, the fruit of a forest tree of Brazil. See BRAZIL-NUT and SAPUCAIA NUT.

Monkeys, a general name for the animals of the highest mammalian order, the *Primates* (q.v.), excepting mankind and the lemurs; ordinarily also excepting the anthropoid apes (see APE) and the baboons (q.v.). The term in fact, then, is suitably limited to three families, considered in their broadest sense, the *Hapalidae*, *Cebidae* and *Cercopithecidae*. General characters are found in the short hallux, or great toe, being opposable to the other digits of the foot, so that the feet become converted functionally into hands. The pollex, or thumb, of the fore limbs may be absent, but when developed it is usually

MONKEYS

opposable to the other fingers. These animals may thus be called "four-handed" or quadrumanous; hence the old designation *Quadrumana*. The limbs are nearly of equal length. There is only one pair of mammary glands, which are pectoral in position. In many cases the cheeks are dilated into pouches. The teeth consist of two incisors in each side of each jaw. The premolars or false molars, vary in number. The true molars number three in each side of each jaw, the latter teeth being furnished with tubercles of various sizes and shapes, adapted for crushing fruits and vegetables. The canine teeth are generally strong and of large size. A *diastema* or interval exists between the lower canine and the first lower premolar tooth, and between the upper canine and outer incisor teeth; this interval admitting of the large canines being brought into apposition when the jaws are closed.

For information as to the probable descent and geological history of monkeys, see PRIMATES.

The small American monkeys of the family *Hapalidae*, more usually called marmosets (q.v.), seem to be lowest in the scale of structure and nearest the lemurs, and are by some naturalists separated from the *Cebidae* in a group *Arctopitheciini*. They are least in size of the race, have the tail long, hairy and not prehensile; no cheek-pouches or natal callosities; the fore limbs shorter than the hind ones; the thumb not opposable; the ears hairy and of large size; the body covered by a close fur. Their dental formula gives four incisors, two canines, six premolars, and four molars in each jaw — this dentition resembling that of the Old World monkeys, and also that of man himself. The molars are provided with blunt processes. They are confined to tropical America, and wholly arboreal, feed on insects and fruit, and are tamable, gentle and intelligent. See MARMOSET.

Next to these come the *Cebidae*, called New World monkeys, because the family is confined to the American continent, and also known as *Platyrrhini*, because of the broad partition in the nose which widely separates the nostrils and causes them to open somewhat laterally. They are characterized by the possession of an extra premolar on each side of each jaw; and by the length and strong prehensility of the tail in most forms — an arrangement by which the end of the tail (naked there on its underside) curls without effort around a limb and clings firmly to it, giving so great assistance in climbing that many of these monkeys exhibit wonderful agility among the trees, grasping and swinging by their tails alone, leaving all four feet (or hands) free. By aid of this truly "handy" appendage some species will join into living chains, by means of which several will hang from a limb enabling the lowest one to grasp desired objects, otherwise unattainable; or will form bridges across spaces too long for the laden mothers or young to leap, and so the whole band will pass over a gap which they fear to cross by descending to the ground or swimming a stream. The ears are rounded and with most of the face, are destitute of hair, there are no cheek-pouches or callosities on the buttocks, so characteristic of the Old World forms. The hind limbs are generally the longer in this section. In the spider monkeys, however, the fore limbs are longer than the hinder members. The thumbs are not

generally opposable, and may be wanting; and the thumb in these monkeys more nearly approaches the other fingers in size and form. Unlike other monkeys, they have the thumb placed in nearly the same plane as the other fingers, so that the mere position of the thumb renders it unfitted. The great toe is generally of large size, and is more capable of being opposed to the other digits than the thumb. The diet is mainly of a vegetable nature, and their life almost exclusively arboreal, a fact which, more than any question of climate, seems to limit them in range to the region of the tropics, between the plains of northern Mexico and those of southern Brazil, since several species dwell in the cold regions of high mountains. Of the *Cebidae* the spider-monkeys (*Ateles*) present very typical examples. In these forms the tail reaches its greatest development as a prehensile organ. The limbs are exceedingly slender, and the thumb is rudimentary. (See SPIDER-MONKEY.) The capuchin monkeys, or Sapajous (q.v.) form the type of the genus *Cebus*, and include many species, as also does the genus *Callithrix* (see SQUIRREL-MONKEY). The howling monkeys (*Myocetes*) are so named from the loud howling noises they are capable of producing, through the possession of a bony "drum," which opens into the larynx, and which greatly increases the resonance of the voice. (See HOWLERS.) Other genera are *Pithecia*, the sakis, or hooded monkeys; *Uacavia*, the woolly monkeys; *Chrysotrux* or golden monkeys; and *Nictipithecus*, the golden monkeys, elsewhere described.

The last and highest section of the monkeys (next to the anthropoid apes) is that of the Old World tribe *Cercopithecoidea*, if that family name is used, as is recently the custom, to cover all the formerly called "catarrhine" monkeys, distinguished by their obliquely-set nostrils, the nasal apertures being placed close together, and the nasal septum being narrow. Opposable thumbs and great toes exist in all, except the genus *Colobus*, the members of which want thumbs. The teeth are arranged to exhibit four incisors, two canines, four premolars, and six molars in each jaw; the incisors are prominent, and the canines are especially large and strong — the latter teeth being separated by an interval or diastema from the upper outer incisor, and from the first lower premolar. The tail may be rudimentary or wanting, but in no case is it prehensile. Cheek-pouches, or pocket-like cavities excavated in the cheeks, which are used as receptacles for food preparatory to its mastication, are present in many; and the skin covering the prominences of the buttocks is frequently destitute of hair, becomes hardened, and thus constitutes the so-called *natal callosities* of these animals. Sometimes these callosities exhibit brilliant colors, and the skin in the neighborhood of the nose, as in the mandrill, may also be striped with gay hues. In their distribution all the catarrhine monkeys inhabit Asia and Africa, a macaque inhabiting the Rock of Gibraltar, and called Barbary ape (q.v.).

Many of these monkeys are small or of moderate size, handsome and graceful. Such are the African guenons, green monkeys and mangabeys (q.v.) of the genera *Cercopithecus* and *Cercocebus*. Nearly related to them are the macaques (q.v.); and the baboons (q.v.). These have cheek-pouches, and the fore limbs the

AMERICAN MONKEYS.

1. Titi or Death's-head Monkey (*Chrysotrrix sciureus*).
2. Uakari Monkey (*Uacaria calva*).
3. A group of Capuchins or Sapajous (*Cebus*).

4. Barrigudo (*Lagothrix humboldti*).
5. Spider Monkey (*Ateles bartletti*).
6. Black Couxios (*Pithecia satanus*).

OLD WORLD MONKEYS.

1. Hanuman Monkey (*Semnopithecus entellus*).
2. Negro Monkey (*Semnopithecus maurus*).
3. Green Monkey (*Cercopithecus callitrichus*).

4. Pig-tailed Monkey (*Macacus leoninus*).
5. Bonnet Macaque (*Macacus cynomolgus*).
6. Diana Monkey (*Cercopithecus diana*).

MONKHOUSE—MONMOUTH

longer. The genera without cheek-pouches and with the hind limbs longer than the fore limbs, are the African thumbless genus *Colobus*, which contains the guenzas (q.v.); and the East Indian tribe *Semnopitheus* which contains the Hindu sacred monkey or entellus (q.v.), the proboscis-monkey, negro monkey and several others described elsewhere under their names, some of which are large and extraordinary.

These Old World monkeys are more varied in their food and activities than are those of America, and are far superior to them in intelligence; consequently they furnish nearly all the pets, circus-performers and servants of wandering musicians that we see from time to time. Many of them breed in captivity, adapt themselves well to civilized life, and betray a surprising ability to learn in various directions, though prone to be inattentive, and growing dull and surly in old age. Few, however, when taken into cold climates live long, even when most carefully treated, as they seem peculiarly susceptible to diseases of the lungs, which usually have a fatal termination.

Excellent accounts of the monkeys of the world exist in the 'Standard,' 'Royal,' 'Cas-sell's,' and 'Allen's Natural Histories'; the last and most recent being a monograph by Forbes. Otherwise information must be gleaned mainly from the books of scientific travelers.

Monkhouse, William Cosmo, English author: b. England 1840; d. Skegness, Lincolnshire, England, 20 July 1901. He received his education at St. Paul's School in London and in 1857 became a junior clerk in the Board of Trade office with which he was connected with advancement for the remainder of his life. Although not a great poet his work enjoys a high reputation among the works of the minor poets and as an art critic he won considerable attention. His work for the 'Dictionary of National Biography' takes within its scope practically all of British art. He published: 'A Question of Honor,' novel (1868); 'The Works of John Henry Foley' (1875); 'The Italian Pre-Raphaelites' (1887); 'British Contemporary Artists' (1899); etc. Among his poetical works are: 'A Dream of Idleness' (1865); 'The Christ upon the Hill' (1895); etc.

Monks'hood. See ACONITE.

Monmouth, mōn'mūth, James, DUKE OF, claimant to the English throne: b. Rotterdam 9 April 1649; d. London 25 July 1685. He was the natural son of Charles II. and of Lucy Walters, as seems certain from the king's open recognition of him, although he so closely resembled Robert Sidney, whose mistress his mother had been, that Sidney has been supposed his father. He was brought up in France under the care of Henrietta Maria, the queen-dowager; was recognized and summoned to England by his father after the Restoration; was married to Anne Scott, heiress of Buccleuch and made Duke of Monmouth; and served in Holland in 1673. His Protestant sympathies, his clemency to the Scottish Covenanters whom he defeated at Bothwell Bridge (1679), and a story persistently circulated (and denied before Privy Council by the king) that Charles had secretly married his mother in Holland, made him popular with the Protestant party; and Shaftesbury repeatedly urged the king to legitimize him and

ensure a peaceable Protestant succession. He did his best to exclude James from the throne. After the Rye House Plot he escaped to Holland. Thence after the accession of James II. he invaded England, possibly with the complicity of William of Orange, called the people to arms, raised a large force of Protestants, was proclaimed king at Taunton, but was defeated by Faversham at Sedgemoor. Taken prisoner he begged for his life from the king to no purpose, and was executed at the age of 36. He was handsome, weak, fickle, and in his claims to the throne no doubt entirely under the control of political plotters. The 'Diaries' of Evelyn and Pepys give the setting of Monmouth's career; his rising is sketched with some historical verisimilitude in Doyle's 'Micah Clarke' (1888), a romance. Consult also Roberts, 'Life of Monmouth' (1844) and Fea, 'King Monmouth' (1901); the latter work outlines the popular legend that Monmouth was not executed, a substitute having taken his place, and tells how the country people long expected his return.

Monmouth, Ill., city, county-seat of Warren County; on the Chicago, Burlington & Quincy and the Iowa Central R.R.'s; about 95 miles north by west of Springfield. It is in an agricultural region, and nearby are coal fields and valuable clay deposits. It was settled in 1836, and in 1852 was incorporated. The present charter (1904) was granted in 1874.

The chief manufactures are pottery, sewer pipe, stoneware, boxes, agricultural implements, stump-pullers, soap, flour and dairy products. The trade is principally in coal, grain, flour, poultry, dairy products, and live-stock. Monmouth College, founded in 1856 under the auspices of the United Presbyterian Church, is here, also the Warren County Library. The chief city officers are the mayor, who holds office two years, and the council. The waterworks are owned and operated by the municipality. Pop. (1890) 5,936; (1900) 7,450.

Monmouth, Battle of, in American history, a celebrated engagement between the American and British forces, the former commanded by Gen. Washington and the latter by Sir Henry Clinton, which took place at Freehold, Monmouth County, N. J., 28 June 1778. On 18 June Sir Henry Clinton, acting under peremptory orders from the British ministry, evacuated Philadelphia, which had been occupied by his army since the preceding September, and proceeded across New Jersey toward Brunswick, with a view of embarking on the Raritan. On hearing of this movement, Washington broke up his camp at Valley Forge, and, having sent forward some light troops to harass the enemy, started in pursuit. Owing to excessive heat the march of both armies was slow. At Allentown Clinton turned to the right by a road leading through Freehold to Sandy Hook, to embark at the latter place; and Washington, who had hitherto been deterred by the advice of his officers, and particularly of Gen. Charles Lee, from attacking the enemy, determined at once to give him battle. The evening of the 27th found the main body of the enemy encamped on high ground near Monmouth court house, while the American advance, about 4,000 strong, under Lee, was posted at Englishtown, 5 miles distant, with the main body about 3 miles in the rear.

MONMOUTH COLLEGE—MONOCACY

The command of the advance had originally been given to Lafayette, with the consent of Lee; but the latter subsequently applied for and obtained it. Early on the 28th Lee engaged the rear division of the enemy, his orders being to hold it in check until the main body under Washington could come up. The Americans were at first successful, but owing to causes which have never been satisfactorily explained, the whole body soon after fell into a confusion (possibly because of Lee's attempted treason), and commenced a disorderly retreat, closely followed by the British. Washington, who was advancing hastily with the main body, received the first intimation of this movement in the crowds of fugitives who poured along the road. Exasperated at the failure of Lee to execute his orders he rode up to that general and reprimanded him. Then he re-formed them, and hastened back to bring up the main body. Lee, resuming his command, held his position with spirit until compelled to retire and brought off his troops in good order. The main body, which had meanwhile taken a favorable position on an eminence, with a morass in front and a wood in the rear, opened an effective cannonade upon the British. The latter, after an ineffectual attempt to turn the American left under Lord Stirling, directed their chief efforts against the right commanded by Greene, where Wayne, under cover of an orchard, was harassing their centre by a severe fire. To dislodge him Col. Moncton advanced with a column of royal grenadiers, but fell at the head of his troops, who were repulsed with considerable loss. The enemy at length fell back to the ground occupied by Lee in the morning, whither Washington was preparing to follow them when the approach of night and the exhaustion of his men induced him to defer the execution of his plan until the morning. During the night Clinton effected a noiseless retreat, and at daybreak was many miles away from the scene of battle. The excessive heat of the weather and the fatigued condition of the troops rendered a pursuit impracticable, and the royal army was suffered to proceed unmolested to the place of embarkation. The American loss in this engagement was 69 killed and 160 wounded; the British 300 killed and 100 prisoners including wounded. Their total loss by desertions and the casualties of battle during their march through New Jersey has been estimated at 2,000. For his conduct in this battle Lee was court-martialed and suspended for one year from his command.

Monmouth College, in Monmouth, Ill., a coeducational institution, under the auspices of the United Presbyterians. It was founded in 1856, and in 1903 there were connected with the school 19 professors and instructors and 360 students. There were about 6,500 volumes in the library; the grounds and buildings were valued at \$125,000; the productive funds amounted to \$200,000; and the annual income was about \$26,000. The departments are the preparatory, music and art, and graduates. The college courses consist of nine groups which lead to the degrees of B.A. and B.L.

Mono, mō'nō, a lake or "sink" in Mono County, Cal., on the eastern slope of the Sierra Nevada, about 150 miles southeast of Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles. A

short railroad passes along the eastern shore. A number of streams enter the lake, but it has no apparent outlet. The waters are alkaline and contain no fish. A species of insect deposit their ova on the surface of the waters, and sometimes so great are the numbers that they look like islands. The Digger Indians collect the insects and ova, and prepare from them an edible delicacy. See KOOCHAE-BEE.

Mono, the common name in Guatemala for the Central American howling monkey (*Myctes villosus*). See HOWLER.

Monocacy, mō-nōk'a-si, **Battle on the**. In 1864 (4 and 5 July) Gen. Early, after driving the Union forces, under Gen. Sigel, from the lower Shenandoah Valley, crossed the Potomac into Maryland north of Harper's Ferry, on his march to Washington, demonstrated on Sigel, who had retreated to Maryland Heights and, crossing South Mountain by Turner's and Cramp-ton's Gaps, concentrated his main body on the night of the 8th near Middletown in the Catocin Valley, his cavalry, after some sharp skirmishing during the day, being in advance, between Middletown and Frederick. Meanwhile Union forces had gathered to oppose his march. Gen. Lew Wallace, commanding the Middle Department, with headquarters at Baltimore, on the 6th collected a mixed force, numbering 2,700 men, under Gen. E. B. Tyler, at Monocacy Junction, near Frederick, and disposed it to cover the Baltimore & Ohio railroad and its bridge, and the Baltimore pike with its stone-pier bridge. Cavalry was sent out on the road beyond Frederick, which ran into Bradley T. Johnson's cavalry, and fell back. On the 8th Wallace was joined by a part of Ricketts' division of the Sixth corps from the Army of the Potomac, which was advanced to Frederick, but during the night it was withdrawn and crossed to the east bank of the Monocacy, where meanwhile other parts of Ricketts' division had come up by rail from Baltimore. Ricketts' division of about 3,350 men was formed on Tyler's left, covering the Washington road and its wooden bridge. Both flanks and the fords were guarded by cavalry, and skirmishers were deployed on the bank of the river. Wallace had but six field-guns; three were given to Tyler and three to Ricketts. An earthwork and two blockhouses commanded both the railroad bridge and the bridge on the Washington road. On the morning of the 9th Early advanced from Frederick to attack Wallace, Rodes' division on the left, along the Baltimore Pike, and Ramseur's in the centre on the Washington road, while Gordon's division, following McCausland's cavalry, inclined to the right to reach the fords a mile below Wallace's left. Rodes and Ramseur drove the Union skirmishers to the banks of the river; Ramseur drove those in his front beyond it; and four heavy batteries of 16 guns crowning the heights near the river, at 9 A.M. opened fire upon the Union lines opposite. By noon the Confederate cavalry had forded the river, and dismounting, advanced on Ricketts' left, gaining a temporary advantage, but were soon driven back. Gordon then crossed his infantry and reinforced the cavalry. Ricketts, holding on to the bridge with his right to check Ramseur, changed front to the left and engaged Gordon and the cavalry, sometimes yielding ground, and again regaining it, but the enflading fire of the

guns across the river, and the continued heavy pressure of Gordon on his front, right, and left flanks, caused Wallace at 4 P.M. to withdraw him toward the Baltimore Pike, having first burned the wooden bridge and the blockhouse at its farther end. Tyler had continued to hold his position against Rodas, in part west of the river, covering the stone bridge of the Baltimore Pike, but Gordon's troops, following up the east side of the stream, on Ricketts' heels, struck the pike before the bridge-guard could get away, capturing several hundred prisoners, Tyler narrowly escaping. Wallace fell back by the Baltimore road in the direction of Ellicott's Mills, Early following but a short distance. Early buried his dead and sent over 400 of his severely wounded to the hospitals in Frederick. He levied and collected \$200,000 from the citizens of Frederick, seized a good supply of shoes, bacon, and flour, and on the morning of the 10th resumed his march on the direct road to Washington, halting at night within four miles of Rockville. The Union loss at Monocacy was 123 killed, 603 wounded, and 568 missing, a total of 1,294, of whom 1,073 were of Ricketts' division. Early reports his loss as about 700 killed and wounded, but it must have been greater, as Gordon reports the loss in his division alone as 698. The great importance of the battle on the Monocacy lies in the fact that the day gained in delaying Early enabled the remainder of the Sixth corps to reach Washington from Grant's army, as well as a part of the Nineteenth corps from New Orleans, before Early could make an attack on the city. Gen. Grant says: "Whether the delay caused by the battle amounted to a day or not, Gen. Wallace contributed on this occasion, by the defeat of the troops under him, a greater benefit to the cause than often falls to the lot of a commander of an equal force to render by means of a victory." Consult: 'Official Records,' Vol. XXXVII.; Pond, 'The Shenandoah Valley in 1864'; Grant, 'Personal Memoirs,' Vol. II.; Early, 'Last Year of the War for Independence'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Mon'ochord, a musical instrument with one string, invented by Pythagoras, and much employed by the ancients in the musical training of the voice and ear. The modified form of the instrument used in natural philosophy lecture-rooms is often called a sonometer; it consists of one or more strings stretched over a sounding-box. A string is fastened at one end of the box, and passes at the other end over a fixed pulley, which enables it to be stretched by means of weights; it passes over two fixed bridges near the ends of the box, and there is a movable bridge between to alter the length of the vibrating portion of the string. Strings are employed to produce musical sounds in the violin, harp, guitar, piano, etc. The sonometer is an indispensable piece of apparatus to lecturers on acoustics not only for the proof of the law of vibrating strings, but also to illustrate the relations of harmonics and the fundamental ideas of undulations. See also **VIBRATION**.

Monochromatic Light, in physics, a light which consists of a single color which is so pure and so definite that when it is examined by

the spectroscope it gives but a single bright line. An approximately monochromatic light may easily be obtained by volatilizing salt, or some other sodium compound, in the flame of a Bunsen burner. An orange-yellow color, of great purity, results. Viewed by this light, everything white or yellow looks bright, while vermilion, ultramarine and other colors that do not contain any sensible proportion of yellow, appear black. Monochromatic light is greatly used in physics, for the study of certain kinds of phenomena in optics.

Mon'ochrome (Greek, *monos*, single, and *chroma*, color), in ancient art, a painting executed in a single color. The first specimens of the art of painting were of one tint only, which was most commonly red, made either with cinabar or minium. Instead of red, white paint was sometimes used. The first four plates in the first volume of the paintings of Herculaneum contain several monochromes upon marble. The most numerous monuments existing of this kind of painting are on terra cotta. A painting, to be a proper monochrome, must be relieved by light and shade.

Monoclin'ic System. See **CRYSTAL**.

Monocotyle'dons, plants of that grand division of angiospermous plants whose embryos sprout in only one seed-leaf or cotyledon, which springs from one side of the axis of growth; the opposite of Dicotyledons (q.v.). In one system of botany the term was employed as a synonym of *Endogens*, but this use is obsolete.

Monodel'phia, the name formerly applied to all mammals esteemed higher than marsupials (*Didelphia*) considered as a group distinguished primarily by the fact that the uterus or womb is single, and shows a single uterine cavity. It has been shown, however, that this distinction does not hold, and the term has consequently become obsolete.

Monœ'cius Inflorescence. See **DIÆCIOUS FLOWER**.

Mon'ogram (*monos*, single or only, and *gramma*, meaning "a single mark"), a character or cipher composed of one, two, or more letters interwoven, being a sort of abbreviation of a name, used as a seal or badge, in coats of arms, etc. Monograms were much used on coins, by the Romans, for instance, though they did not employ them on inscriptions; and were also used on standards, walls and tapestry, seals and documents; first on coins, latest on documents, in which they were employed not only by princes and ecclesiastical dignitaries, but also by magistrates and notaries. At the commencement of the Christian period their use was universal. The titles and rubrics of Greek manuscripts are frequently monogrammatic, and numerous and diversified monograms are found in Latin manuscripts. Alphabets like the Roman, of an angular character, have many letters with corresponding parts; and the upright strokes, the horizontal lines, and the curves are easily made by arranging them so that the similar portions shall coincide, to produce numerous combinations. Monograms are generally combinations of more than two letters; when only two were incorporated they were generally designated ligatures. After the 12th century they gradually went out of use. The use of them remained

MONOLITHS—MONOPLEGIA

longest in Germany, where it was formally abolished by the Diet of Worms, in 1495. The knowledge of monograms of this public kind is of great importance for the illustration of the monuments and documents of the Middle Ages, and therefore forms a particular branch of diplomatics; for they were much employed in the mediæval diplomatic art. The term was subsequently applied to all sorts of ciphers and signs, with which artists, particularly painters and engravers, were accustomed to designate their works. The mediæval seal-engraver, to economize as much as possible the annular space available for the legend, favored much both ligatures and monograms. Many of those seals had the initials of their owners blended and incorporated with the devices, called merchant-marks, corresponding somewhat to the modern trade-marks, which were the stamp, as it were, by which the work of each artist was known. Many of the modern monograms are copied from mediæval examples. Consult: Brulliot, 'Dict. des Monogrammes' (1832-34); Duplessis and Bouchot, 'Dict. des Marques et Monogrammes de Graveurs' (1886-7); Bouvenne, 'Les Monogrammes Historiques' (1870); Fagan, 'Collectors' Marks' (1883).

Monoliths. See **STANDING STONES**.

Monometallism, the principle of having only one metallic standard in the coinage of a country, opposed to bimetalism. See **BIMETALLISM**; **COINAGE**; **CURRENCY**.

Monona, mō-nō'nā, a lake in Wisconsin, one of a group of lakes near Madison in Dane County. See **FOUR LAKES**.

Monongahela, mō-nōn-ga-hē'la, a river which has its rise in the northwestern part of West Virginia, and flows north into Pennsylvania, where it unites, at Pittsburg, with the Allegheny and forms the Ohio River. The headwaters of the Monongahela are in the Alleghany Mountains near the headwaters of the Potomac. The two head-streams of the Monongahela unite near Fairmont in Marion County, W. Va., and from the point of junction on the north become a swiftly flowing stream, furnishing water-power for several manufacturing towns and cities. The whole course is very irregular; the length is about 300 miles. It has been made navigable about 106 miles from its mouth to Morgantown, in Monongalia County, W. Va., by a system of locks, nine in number. Other locks above Morgantown are being constructed and government plans to make the river navigable as far as Fairmont are being put into execution (1903). The largest tributary is the Youghiogheny, a navigable river, which has its source in the mountains in the southwestern part of Garrett County, Md., and enters the Monongahela near Pittsburg. The Cheat River, the next largest tributary, is a stream in the northeastern part of West Virginia. It joins the Monongahela in Pennsylvania, a few miles north of the border. The river flows through a country which has fertile farm lands in the valley, and the whole section is rich in coal.

Monongahela City, city in Washington County, Pa.; on the Monongahela River, and on the Pennsylvania and the Pittsburg & L. E. R.R.'s; about 32 miles south of Pittsburg. It is in a coal region, in which the chief industries are coal mining and manufacturing. It was set-

tled in 1792 by Joseph Parkison, was incorporated as a borough 3 April 1833, and chartered as a city 24 March 1873. It has (1903) 15 large industrial establishments, employing about 5,800 persons, or about 600 more than the whole population as given by the Federal census of 1900. The chief manufactures are glass, foundry and machine-shop products, flour, lumber, and paper. It has considerable trade in the home manufactures, and in coal and farm products. The principal buildings are 11 churches, five public schools, an academy, and a Memorial Hospital. The four banks contain a combined capital of \$2,500,000. The government is administered under the original charter, and provides for a mayor and a council of 12 members, all of whom are elected annually. The majority of the inhabitants are American born, but there are quite a number of Italians and Slavs. Pop. (1890) 4,096; (1900) 5,173. It increased considerably in population from 1900 to 1903.

VERNON HAZZARD,

Editor 'Republican,' Monongahela, Pa.

Monoph'ysites, those followers of the heretical opinion in the early Church, which ascribed but one nature to Christ in contradistinction to the orthodox doctrine that he was true God and true man. The Monophysites were mainly confined to the Eastern Church, and obtained no footing in the West. The edict called Henoticon, issued by the Emperor Zeno in 482, was not able to quiet the long and often bloody contests incident to this controversy, and the orthodox church, by its sentences of excommunication, occasioned a formal secession on the part of the Monophysites. This separation took place in the first half of the 6th century. Nor did they remain united among themselves. In 519 controversies arose among them respecting the question whether the body of Christ is corruptible or not. About 560 a Monophysite, Askunagias, and after him Philoponus, a noted Alexandrian philosopher of that century, conceived the idea of styling the three persons of the Deity three Gods. These Tritheists and their adherents, even in the eyes of the Monophysites, were the rankest heretics, and were the occasion of many Monophysites turning Catholics. In Egypt, Syria, and Mesopotamia the Monophysite congregations, however, remained the strongest, had patriarchs at Alexandria and Antioch, existing, without interruption, by the side of the imperial orthodox patriarchs; and after the Syrian, Jacob Baradaeus, had, about 570, established their religious constitution, formed the independent churches of the Jacobites and Armenians, which separated from the Greeks as well as the Romans, and have for that reason been able to maintain themselves since the 7th century, even under the dominion of the Mohammedans. Excepting their peculiar doctrine of one nature in Christ, they coincide, in the main points of belief, with the Greek Church; their worship also resembles the Greek rather than the Roman, but has, from their national character and their superstition, received variations, which are most striking in the religious constitution of the Egyptian Jacobites (q.v.). See **JACOBITES** and **Armenian Church** under **ARMENIA**.

Monoplegia, mōn-ō-plē'jī-a (from Greek μόνος, single + πλῆγη, a stroke), a paralysis limited to one organ or part. It is caused by

MONOPOLY — MONOTHEISM

circumscribed lesions of the nervous system, in brain, spinal cord, or nerves. An example of such paralysis is monoplegia facialis, Bell's palsy (q.v.).

Monop'oly (Greek, *monopolia*, single or sole selling) is an exclusive right, secured to one or more persons, to carry on some branch of trade or manufacture, in contradistinction to a freedom of trade or manufacture enjoyed by all the world. The most frequent monopolies formerly granted were the right of trading to certain foreign countries, the right of importing or exporting certain articles, and that of exercising particular arts or trades. Such exclusive rights were very common in Great Britain previous to the accession of the house of Stuart, and were carried to an oppressive and injurious extent during the reign of Queen Elizabeth. The grievance at length became so insupportable that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by an act of 1624. This act secured the freedom of industry in Great Britain; and has done more, perhaps, to excite a spirit of invention and industry, and to accelerate the progress of wealth, than any other in the statute-book. There is one species of monopoly sanctioned by the laws of all countries that have made any advances in the arts, namely, the exclusive right of an invention or improvement for a limited number of years. It is, in fact, a kind of property created by law for the benefit of the inventor, and which he could not effectually acquire or secure without the aid of the law. The exclusive right of an author to the publication of his own work is hardly a monopoly, but rather a right of property, resting upon the same principle as the right to lands or chattels. The law, therefore, by giving an author the exclusive right to the publication of his own work for a limited number of years makes no grant; it is only allowing him what is his own for a limited time. But the exclusive right to the use of an invention or improvement is a monopoly, since it deprives others, for that period, of the chance of the advantage of making the same improvement, discovery, or invention themselves. Capitalists, either single or combined, may produce commodities so much better and cheaper than others can do as practically to command the entire sale, and are in popular language called monopolists. But having no legal rights or advantages that are not open to all, they are not in the legal sense in possession of a monopoly. In the oldest sense of the term they are monopolists; but since the term is now used in an unfavorable sense, its discontinuance as applicable to these is only just. It may be assumed as an economical axiom that every interference with absolute freedom in acts of exchange can be defended only on the highest grounds of public policy. Any advantage given to a particular interest is not only a wrong to the general public, but will in time bring a just retribution to the favored class.

In the United States the only monopolies that the laws and the individual States look on with favor consist of the post-office, which is a government monopoly, and the rights granted to individuals under the patent and copyright laws. Monopolies commonly known as trusts are looked on with odium, and various States have

enacted laws making a trust an illegal combination of individuals. See TRUSTS.

Mon'oth'eism (Greek *μῦθος*, only one; *θεός*, god), the belief in the existence of one only, as opposed to a belief in many gods, polytheism. Even in polytheisms there is generally some chief and predominant deity, and many investigators believe that the belief in a divine power and person may be traced through three stages of development. The vague impression which savage man receives from witnessing the operations of nature changes into a conviction that there is some superior and invisible power overruling all things; to the agency of this power he attributes the suffering, disease and death which he meets with in the experience of life. This unanalyzed power is dimly conceived of by him as one and all pervading, and primitive deism of this kind has received the name of Henotheism (from the Greek *ἑνός*, one). It is only when fancy and imagination begin to operate, and the clouds of superstition to darken, that this unified power is differentiated, and each manifestation of it, in the sea, the sky, the soil, is attributed to a specific agent. The complicated mythologies of Greece and Rome are high developments of original henotheism, rather than proofs of degeneracy. In the earliest stage of human development science and theology are one, and must advance together; they can only advance by analysis, which reveals the differentiation of species, and concomitant complexities. Hence the discovery of a new god every time the mind has been concentrated upon a single and distinct operation or phenomenon of nature, whether it be the rainbow, the storm at sea, or a volcanic eruption. When science and theology are once divorced, the result must be either monotheism or atheism.

The history of monotheism may be thus summarized: According to Professor Max Müller the conviction of the existence of one God was not an intuition, but the result of a gradual education. It is held by some that the third chapter of Genesis embodies the doctrine of the unity of the Godhead, and of a co-equal and co-eternal Trinity. In the earlier Vedic writings, which exhibit the most primitive workings of the human mind of which we have any record, we find that a consciousness of their own existence led men to endow every created object with life. The natural issue of such a condition of thought was either polytheism or fetishism, that is, either a plurality of deities with human forms and passions, or an abject terror of inanimate objects. But anthropomorphous polytheism did not determine the convictions of the highest thinkers under the system, such as Buddha, Confucius, Socrates, Plato, etc. The writings of Confucius, Buddha, Plato and even Hesiod and Sophocles prove that the religious convictions of a people are not to be measured or tested by the gross details and elaborate observances of a mythological system. The Jewish prophets had a firm persuasion of one God, the Father and Judge of all; but they are continually upbraiding the people for lapsing into polytheism. After the Babylonish captivity the people became fixed in their belief; and now the Jews and Mohammedans hold the doctrine of the divine unity with as great rigor and tenacity as modern Christians. They will not countenance even the Trinitarian conception of Deity, although this is as purely

MONOTHELITES — MONROE

monotheistic as their own anthropomorphic notions of the Supreme Being. The monotheism of the Hebrews came to Europe as a systematized doctrine, just when Greek philosophy had succeeded in sweeping away the last vestige of polytheism among the civilized peoples of the Mediterranean basin. It came with the added enthusiasm of Christianity and conquered the world. See GOD, TRINITY.

Consult: Renan, 'Histoire générale et Système comparé des Langues Semitiques' (1858); Max Müller, 'Chips from a German Workshop'; Gould, 'Origin of Religious Belief'; Hagenback, 'History of Doctrines'; and Siddon, 'Divinity of Christ.'

Monoth'elites (Greek, *monothēlētai*, from *monos*, and *thelō*, I will), a sect of heretics who maintained that though Christ had two natures co-existing distinctly in the unity of the person, yet these natures possessed or acted by but a single will—the divine, which so predominated over or absorbed the human as to deprive it of all action or efficiency. They have been regarded as an offshoot of the Monophysites, though they themselves denied all connection with them. The doctrine originated with the Emperor Heraclius, who in 630, by adopting a middle course, attempted to reconcile the Monophysites to the orthodox church. The attempt was for a time successful. Heraclius consulted Sergius I., patriarch of Constantinople, on the new dogma, and he not only approved of it, but became its most active propagandist. At his instance, and mainly in consequence of his representations, Pope Honorius I. addressed two letters to Sergius, which according to some interpreters would seem to favor Monothelism. The successors of Honorius condemned the Monothelites, and Martin I., in 649, issued a bull anathematizing them. For this he was sent prisoner to the Chersonesus by the Emperor Constantine, who protected the Monothelites. The sixth ecumenical council, that of Constantinople (680), condemned this heresy, and with this the early controversies on the incarnation became gradually fainter, till they were forgotten amid the disputes between the Iconoclasts and their opponents.

Monotrem'ata, an order of mammals belonging to the subclass *Protothesia* (q.v.) and represented by the duckbill (q.v.) of Australia and Tasmania, and the spiny ant-eaters (see *ECHIDNA*), the range of which extends into New Guinea. In many respects they recall the *Sauropsida* and especially the birds, a fact reflected in the name *Ornithodelphia* sometimes applied to them. The most marked of these peculiarities are the obliteration of the sutures of the skull, the possession of a terminal canal (cloaca) into which both the digestive tract and the urogenital organs empty; the possession of a well developed coracoid bone; and the fact that they do not, like other mammals, bring forth living young, but lay eggs. After the eggs are laid they are transferred to a temporary pouch beneath the abdomen, where they hatch and the young are nourished by the mammary glands.

Mon'otype. See COMPOSING MACHINES.

Monoxid, in chemistry, a compound consisting of one atom of oxygen united to one atom of another divalent substance, or of one atom of oxygen united to two atoms of some other

monovalent substance. The word is used when it is necessary to distinguish two or more states of oxidation of the same substance. Thus CO is called "carbon monoxid," in distinction to CO₂, which is called "carbon dioxid." Similarly Na₂O is "sodium monoxid," while Na₂O₂ is "sodium dioxid." See OXIDS.

Monro, mün-rō', Alexander, Scottish anatomist: b. London 8 Sept. 1697; d. Edinburgh, 10 July 1767. He studied at Edinburgh, afterward in London under Cheselden, and still further both in Paris and Leyden, at the former under Bouquet, and at the latter under Boerhaave. On his return to Edinburgh in 1719 he was made professor of anatomy and surgery to the surgeon's company; in 1720, the first university professor of anatomy, though not inducted till 1725. He attended the wounded on the field at Prestonpans (21 Sept. 1745), and was an accurate observer, having studied the effect of the presence of solid bodies in the vermiform appendix, and otherwise anticipated later views. He resigned his professorship in 1764. His principal work is 'Osteology, a Treatise on the Anatomy of the Human Bones' (1726), once a popular text-book.

Monro, Alexander, known as Secundus; Scottish anatomist: b. Edinburgh 20 May 1733; d. there 2 Oct. 1817. He was son of Alexander Monro (1697-1767) (q.v.). Educated at Edinburgh University (M.D. 1755), he also studied on the Continent, and in 1759-1808 lectured at Edinburgh. In 1783 he described the communication between the lateral ventricles of the brain, known as the foramen of Monro. He published 'Three Treatises on the Brain, the Eye, and the Ear' (1797) and other medical works.

Monro, Alexander, known as Tertius, Scottish anatomist: b. Edinburgh 5 Nov. 1773; d. Craiglockhart, near Edinburgh, 10 March 1859. He was the son of Alexander Monro (1733-1817) (q.v.). He obtained his M.D. at Edinburgh in 1797, was appointed conjoint professor with Monro Secundus of medicine, surgery and anatomy, and in 1817-46 was sole professor. His works include 'Observations on Crural Hernia' (1803), and other publications, of no permanent value.

Monroe, Harriet, American author: b. Chicago, Ill.; 23 Dec. 1860. She was graduated from the Visitation Academy, Georgetown, D. C., in 1879 and has since devoted herself to literature. In 1889 she wrote the text of the cantata given at the opening of the Chicago Auditorium and in 1891 wrote by request of the committee the 'Columbian Ode' which was sung at the dedicatory ceremonies at the World's Columbian Exposition in 1892. She has published: 'Valeria and Other Poems' (1892); 'John Wilborn Root—a Memoir' (1896); etc.

Monroe, James, fifth President of the United States: b. in Westmoreland County, Va., 28 April 1758; d. New York 4 July 1831. He was descended from a Scottish cavalier family, studied for a short time at the College of William and Mary, which he left on the outbreak of the Revolutionary War to enlist in the Continental army, and in 1776 became lieutenant in a Virginia regiment. He served in the campaign on the Hudson, taking part in the battles of Harlem Heights and White Plains. Accom-

JAMES MONROE,
5TH PRESIDENT OF THE UNITED STATES.

MONROE

panying Washington in his retreat through New Jersey, he distinguished himself at the battle of Trenton, where he was wounded. As major on the staff of Lord Stirling (William Alexander) he served in the campaigns of 1777-8, winning credit in the battles of Brandywine, Germantown, and Monmouth. Having lost his rank in the line by becoming a staff-officer, and failing in an attempt to raise a regiment which was authorized by the legislature of Virginia, he withdrew from the military service, made the acquaintance of Jefferson, and with him studied law, the two forming a life-long intimacy. During the subsequent invasions of Virginia he took an active part in organizing the militia for defense. In 1782 he was elected to the Virginia legislature, and was also appointed a member of the Executive Council. In the Congress of the Confederation, where he served from 1783 to 1786, he advocated extension of the powers of that body, and the favorable action upon his motion to this end was a distinct step toward the formation of the Federal Constitution to supersede the inadequate Articles of Confederation. On the important questions of the time—trade between the States, public lands, navigation of the Mississippi, etc.—he acquired authoritative information which gave him great influence in the deliberations of Congress. Retiring from that body in 1786, he was again elected to the legislature of Virginia, and in 1788 was chosen a member of the State convention called to act upon the ratification of the Federal Constitution, which he joined with Patrick Henry and others in opposing, objecting to the centralizing features of that instrument. In 1790 Monroe was elected to the United States Senate, where he served until 1794, acting with the Anti-Federalists in earnest opposition to Washington's administration. Notwithstanding this attitude, in 1794 he was appointed minister to France, to succeed Gouverneur Morris, and on his arrival there was enthusiastically welcomed, being received with much fervor in the Convention. As his sentiments toward France at the time were far more cordial than those of his government, he allowed himself expressions before the Convention which met with strong disapproval from the administration, and his conduct in other matters not commending itself to the American government, in 1796 he was recalled. This action led to much controversy after his return, upon which he published a defense that still further strained his relations with the administration.

After a season of retirement Monroe, in 1799, was elected governor of Virginia and served three years, and in 1803 President Jefferson sent him as special envoy to France, to act with Robert R. Livingston, the resident minister, in completing the negotiations which resulted in the Louisiana Purchase (q.v.). In 1803 Monroe was also sent as minister to England; and pending negotiations there concerning the rights of neutrals and the impressment of seamen, he was ordered to Spain to adjust a question of the Louisiana boundary. Failing in this, as he had previously failed in negotiations with Spain for the purchase of the Floridas, in 1806 he was recalled to England, where a treaty was concluded which proved unsatisfactory to the President, who declined to lay it before the Senate, and upon his return to the United States in 1807 Monroe found himself

once more the cause of controversy and involved in a misunderstanding, happily only temporary, with Jefferson. In 1810 Monroe was again elected to the Virginia legislature, and in the following year became a second time governor, but was soon after appointed secretary of state by President Madison. In this office he continued until his election to the presidency, during part of the time acting also as secretary of war. He served with energy and success in both departments, especially during the military operations of 1814-15.

In 1816 Monroe was elected President as the candidate of the Republican (previously Democratic-Republican) party, receiving 183 votes in the electoral college against 34 for Rufus King, candidate of the Federalists. Soon after his inauguration he made an extended personal inspection of military posts and resources, acquiring much knowledge of the condition and needs of the country, winning great popularity, and by his bearing and addresses doing much to prepare the public mind for that "era of good feeling" which made his administration memorable, and during which, in the general prosperity, political rancor was almost stilled. When four years afterward Monroe was re-elected he received all but one of the electoral votes, party divisions having largely disappeared. The President had also established himself in popular favor, especially by the acquisition of Florida from Spain in 1819, a sequel of the Seminole war.

While the eight years of his administration were not marked by stirring events, they showed important results in seaboard defense, strengthening of the army and navy, development of the country's resources, internal improvements, protection of commerce, and increased efficiency of the public service. During this period five States were admitted to the Union—Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820), and Missouri (1821). To the earlier apprehension of trouble through jealousy between the larger and the smaller States had succeeded the graver problems presented by the question of slavery, through which the "era of good feeling" was to give way to new strife of parties and sectional dissensions. The first great encounter in this conflict ended in the Missouri Compromise (q.v.), one of the chief political incidents of Monroe's administration. Yet when in 1824 Lafayette visited the United States he found here a people apparently enjoying every prospect of continued peaceful development, for it was believed that the compromise had finally settled the slavery question. But perhaps the most important result of Monroe's administration is that which followed from its expression of sympathy for South American republics, the promulgation of the Monroe Doctrine (q.v.).

His second term having ended, Monroe retired to private life in 1825, and returned to his residence in Loudoun County, Va., but he subsequently served as justice of the peace, and performed his last public service as a member of the Virginia Constitutional Convention, which met in 1829, and over which he presided until ill health compelled him to resign his membership. He removed to New York a short time before his death. From that city, in 1858, his remains were taken to Richmond, Va., and there re-interred with elaborate and befitting ceremony.

MONROE — MONROE DOCTRINE

Consult: Gilman's biography in the 'American Statesman' series (1883; 2d ed. 1898), with bibliography of Monroe and of the Monroe Doctrine; Monroe's 'Writings,' edited by S. M. Hamilton (1898—); and the calendar of his 'Correspondence' in Bulletin No. 2, 1893, of the Bureau of Rolls and Library, State Department.

Monroe, La., city, parish-seat of Ouachita Parish; on Washita River, and on the Missouri P., and the Vicksburg, S. & P. R.R.'s; about 155 miles north by west of Baton Rouge and 55 miles east of Shreveport. It has steamer connections with a number of towns on the Washita River. It is in an agricultural section in which raising cotton and lumbering are the chief industries. There are cottonseed-oil mills, cotton compresses, brick yards, lumber mills, and wooden ware factories. There is a large trade in cotton and lumber. Pop. (1890) 3,256; (1900) 5,428.

Monroe, Mich., city, county-seat of Monroe County; on the Raisin River, and on the Michigan S., the Père M., the Michigan C., and the Lake S. R.R.'s; about 40 miles southwest of Detroit and 85 miles southeast of Lansing, the capital of the State.

It was settled in 1784 by people from Canada, and was first called Frenchtown. In 1815 the name was changed to Monroe in honor of James Monroe (q.v.). It was chartered as a city in 1836. Here took place 22-23 Jan. 1813 the "Battle of Raisin River." The American losses in the battle were 397 killed, 537 captured; and the British losses were 24 killed and 158 wounded. Only 33 of the Americans escaped. A number of the American wounded and prisoners were left here by the British, in charge of a few soldiers. The Indians attacked and massacred all of them. The battle cry used later in the War of 1812 and afterward when disputes arose with the British, was, "Remember the River Raisin."

The city is in a fertile agricultural region and a trade centre for a large section of the southeastern part of the State. Its principal manufactures are flour, lumber, paper, paint, brick, agricultural implements, stoves, furnace products, furniture, and canned goods. The nurseries nearby and the fisheries give employment to a number of people. The chief buildings are the court-house, opera house, armory, and two orphan asylums, a home for the aged, Saint Mary's Academy, a public library, and a convent. It has the mother house of the Sisters of the Immaculate Heart of Mary, a teaching order of Sisters who have schools in various parts of the country, and whose pupils number about 10,000. In connection with the convent and academy are a large library and a fine museum. Pop. (1890) 5,258; (1900) 5,043.

Monroe, N. C., city, county-seat of Union County; on the Seaboard Air Line railroad; about 120 miles, in direct line, southwest of Raleigh. It is in a cotton growing region, and nearby are gold mines. The chief industrial establishments are cotton mills, cotton gins, lumber mills, and iron works. The trade is principally in cotton, iron products, lumber, and tobacco. Pop. (1890) 1,866; (1900) 2,427.

Monroe, Wis., city, county-seat of Green County; on the Chicago, M. & St. P. and the Illinois C. R.R.'s; about 40 miles south by west

of Madison. It is situated in an agricultural and stock-raising region, but its manufactures are quite important. In 1859 it was incorporated as a village, and chartered as a city in 1882. The chief manufactures are creamery products, condensed milk, machine-shop products, wagons, carriages, lumber, and foundry products. The trade is principally in the manufactures of the city, farm and dairy products and live-stock. It has good schools and a fine public library which contains about 5,000 volumes. Pop. (1890) 3,768; (1900) 3,927.

Monroe Doctrine. The term Monroe Doctrine has been popularly used for three different principles which at different times have governed the policy of the United States toward Latin America: they are (1) the declaration made in 1823 by President Monroe; (2) various theories of our relations to Latin-America, which theories by several presidents and secretaries of state from 1845 to 1885 have been set forth as forms of the Monroe Doctrine; (3) the general doctrine that the United States has a "paramount interest" in American affairs, a doctrine rapidly developed since 1890.

1. The original Monroe Doctrine grew out of the political conditions of America in the first quarter of the 19th century. In 1823, by a series of revolutions, Spain had lost all her American possessions except Cuba and Porto Rico; Portugal had lost Brazil; France had lost the Island of Haiti; so that England, the United States, and Russia were the only world powers which had large territories and the hope of development in the new world. Toward the dozen so-called states formed out of the ruins of the Spanish and Portuguese empires, the United States felt a natural and lively sympathy, first because most of them were in form republics, and were expected to follow the United States in maintaining popular governments; secondly because the trade of those countries, which had been as far as possible reserved by Spain, was now open to the world, and was valued by the people of the United States.

Europe, in the meantime, after the fall of Napoleon, went into the hands of a great political alliance formed by Austria, Russia, Prussia, and France, and cemented by a treaty called "The Holy Alliance" (1815); this was in effect a system of mutual political insurance, under which, in case of revolution anywhere in Europe, the forces of the allied powers could be used to put it down. A revolution in Spain in 1820 called for the intervention thus arranged in advance, and in 1823 a French army overwhelmed Spain and again placed in power the sordid tyranny of the Bourbons.

So far, the United States was not directly involved; but in 1823 the Spanish Bourbons asked the aid of the Holy Alliance to restore their authority in America; and the United States justly feared that France would undertake this commission, and would receive Cuba as the price of the service, thereby securing a new foothold in America, and a rich island almost overlooking the American coast. Just at this time a question arose as to the possession of the northwest coast of America, where Russia claimed not only a liberal stretch of coast reaching almost to San Francisco, but also the right to keep the vessels of other powers out of the north Pacific Ocean (Ukase of 4 Sept. 1821).

MONROE DOCTRINE

The leading mind in the cabinet of Monroe was not the president, but John Quincy Adams, secretary of state, who saw the great significance, both of intervention in the established Latin-American states, and also of European claims to wild territory in America. England was also interested in unrestricted trade with the Spanish-American countries, and in 1823 George Canning four times proposed to the United States to join England in a declaration against intervention, and Monroe was inclined to accept the proposal. After long cabinet discussion, Adams convinced the President that it would be better to make an independent declaration. Adams' papers show that he not only suggested but formulated most of the important presidential message of 2 Dec. 1823, several passages in which, construed together, constitute the original and genuine Monroe Doctrine. The message includes substantially the following principles: (1) Isolation: there are two spheres of world influence, separated by a meridian drawn through the Atlantic Ocean; two political world entities, with different sets of interests; and since the United States takes no part in the affairs of the European sphere, European powers ought to keep out of American affairs. (2) Colonization: "the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European powers." This was directed against Russia, and specifically excepts "the existing colonies or dependencies of any European power." (3) Intervention: the message assumes that the Latin-American states are permanently independent, and capable of conducting civilized governments; and explicitly and strongly protests against "any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power." (4) Political system: it would be hostile and dangerous to the United States if "the allied powers should extend their political system to any portion of either continent." This clause plainly refers to the mutual assistance given by members of the Holy Alliance. (5) John Quincy Adams undoubtedly desired that the United States should exercise a political leadership over the other American states, but such a principle is not embodied in the message.

The original Monroe Doctrine was at once effective. Canning was so much interested in the result that he claimed it for himself and said (21 Dec. 1826): "I looked another way . . . I sought for compensation in another hemisphere. . . . I called the new world into existence to redress the balance of the old." In reality the United States had struck out a policy for itself. European intervention was abandoned; but when our Latin-American neighbors attempted to get a more distinct promise of military protection, in the Panama Congress of 1826, the United States took the ground that our neighbors must protect themselves, in case of a fight with European powers.

II. The second phase of the Monroe Doctrine began about 1845, because a new set of conditions came about in America. In 1824 and 1825 Russia withdrew all her claims on the Pacific coast south of 54° 40'; Cuba remained safe in the hands of Spain; and France soon ceased to be an important factor in American affairs. The commerce of the United States increased with

all her neighbors. Furthermore the United States assumed new importance in America by the annexation of East Florida in 1819; by the successful assertion of claims to Oregon from 1805; by the annexation of Texas in 1845; and by enormous growth of population and power. In the Mexican War, in 1846, the United States abandoned any right to stand as the special champion or defender of the integrity of Latin-American states, for we invaded and seized Mexican territory.

To meet these new conditions President Polk and other presidents and secretaries of state after him, laid down principles which they held to be a reiteration of the Monroe Doctrine. The annexation of California raised a new question of American policy, by calling attention to the need of a line of transit shorter than the 14,000 mile voyage around the Horn. In formal terms President Polk several times quoted phrases of Monroe's doctrine, and attempted to show that a policy of aggression on our neighbors was a duty prescribed by that doctrine. (Inaugural Address, 4 March 1845; message, 2 Dec. 1845.) In a special message (29 April 1848) he advocated the annexation of Yucatan, on the ground that the Monroe Doctrine required us to take over territory which otherwise might go to European powers. More significant than these appeals to Monroe was the treaty of 12 Dec. 1846 (ratified to June 1848), with New Granada (now Colombia), under which the United States received the right to use, and to maintain order on, any transit line by water or land across the Isthmus of Panama. Another evidence of interest in the rest of America was the Clayton-Bulwer treaty with England (19 April 1850), by which the United States agreed to share with Great Britain the responsibility of guaranteeing any Isthmus communication, and secured from Great Britain a pledge not to exercise any exclusive control over the Nicaragua route. These two ideas of a special guaranty and of a joint guaranty were clearly not covered by, nor contemplated by, Monroe's message of 1823.

A few years later, however, precisely the case which was in Monroe's mind arose. In 1861 France sent an armed force into Mexico, ostensibly to enforce claims, really, as it soon proved, to found a French dependency in America, at a time when the United States was completely occupied in civil war. Secretary Seward in his despatches several times referred to the "tradition" of the United States, to the objection to "foreign occupation," and to "attempts to control" the destinies of republics in America; but though he undoubtedly had Monroe's message in mind, he never mentioned it, probably because he thought that Seward could expound as good a doctrine as Monroe. At the end of the Civil War a large force of troops was directed to the Mexican frontier, and the French were warned by Seward that the time had come to leave the country; with great regret they obeyed the warning. An increasing sense of interest in Central America was shown by Seward's attempts to secure for the United States a foothold for our control of an Isthmus canal. Treaties were made with Honduras (4 July 1864) and with Nicaragua (21 June 1867), by which the United States was to have large rights of control over any canal constructed through either of those countries; and a treaty

MONROE DOCTRINE

with Colombia for exclusive rights of control (14 Jan. 1869) failed in the Senate. At the same time Secretary Seward enlarged the territory of the United States by the annexation of Alaska (treaty of 30 March 1867); but his two attempts to get a West Indian naval station to flank the route to the Isthmus were not successful; the Danish treaty (of 24 Oct. 1867) for the cession of Saint Thomas and Saint John was rejected by the Senate; and the negotiations with San Domingo for Samana Bay were abortive.

When General Grant came to the presidency in 1869 he and Secretary Fish revived with great vigor both lines of the previous diplomacy. In 1870 he negotiated a treaty with Colombia to give us exclusive control over a Panama canal; but it was not ratified. Into a plan for the annexation of the eastern end of the Island of San Domingo Grant threw himself with great earnestness, appealing in several special messages (31 May, 13 June, 5 Dec. 1870, 5 April 1871) to Monroe's doctrine; and Secretary Fish (14 July 1870) laid down the doctrine that the United States "occupy of necessity a prominent position on this continent . . . which entitles them to a leading voice"; but the Senate was not convinced either that the interests of the United States or the Monroe Doctrine required such an annexation.

The applicability of the Monroe Doctrine to the canal question was raised again in 1879 when it was announced that a French company had acquired a concession for a Panama canal and stood ready to build it. Secretary Evarts (8 March 1880) declared roundly that the United States "had a paramount interest" in an Isthmus canal; and President Hayes in a special message (8 March 1880) held that any canal must be "virtually a part of our coast line," and hence a matter "of paramount concern to the people of the United States." A few years later Secretary Blaine in several despatches (7 May, 24 June, 19 Nov. 1881), and Secretary Frelinghuysen (8 May 1882), repeated phrases of Monroe's message, as governing the Isthmus canal.

III. The bankruptcy of the French Panama Canal Company in 1889 somewhat relieved the pressure for the control of the canal and of its West Indian approaches; but in 1895 the Monroe Doctrine was appealed to in a novel way, as controlling a long-standing boundary controversy between Venezuela and the neighboring British colony of Guiana. The United States had repeatedly offered its good offices, and suggested arbitration; inasmuch as Great Britain took no heed, Secretary Olney (20 July 1895) protested against any attempt of a European power to extend its boundary over territory claimed by an American power, because (he said) the Monroe Doctrine provided "that no European power or combination of European powers shall forcibly deprive an American state of the right and power of self-government."

Beyond any previous enunciation of the Monroe Doctrine, Mr. Olney made the statements that "distance and 3,000 miles of intervening ocean make any permanent political union between an European and an American state unnatural and inexpedient"; and that "to-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition:" all these doctrines Mr. Olney believed to be "the

accepted public law of this country." This despatch was fortified by a message from the president (17 Dec. 1895), in which he held that "since in international councils every nation is entitled to the rights belonging to it, if the enforcement of the Monroe Doctrine is something we may justly claim it has its place in the code of international law." He hinted at war as the penalty if Great Britain declined to heed this remonstrance.

Mr. Olney's doctrine was certainly not the original Monroe Doctrine. It is really the laying down of a new principle; namely, that Great Britain, which through its possessions in Canada and the West Indies has for a century been an important American power, is no longer to exercise influence on the future of Central and South America. That lesson Great Britain took to heart, for she accepted the proposed arbitration (by which nearly all the territory in dispute was assigned to Great Britain); and in the Spanish war of 1898 Great Britain was solicitous to make it clear that she would not, and other European powers must not, interfere with the American policy of the United States. As the result of that war, the United States acquired a West Indian station in Porto Rico; and the new attitude of Great Britain led to the first Hay-Pauncefote treaty of 5 Feb. 1900, by which Great Britain agreed to give up the joint control over Isthmus transit, which was provided by the Clayton-Bulwer treaty of 1850. The new arrangement was not satisfactory to the Senate, and hence a second treaty was negotiated (18 Nov. 1901), by which the Clayton-Bulwer treaty was declared abrogated and the United States was left free to control any Isthmus canal, and to "neutralize" it in her own way.

Germany has for some years been looking eagerly about the world for an opportunity to plant colonies, and was supposed to have a special interest in the South American countries. An unofficial and unpublished understanding was reached, however, with the United States, by which Germany undertook to make no conquests or settlements in South America. Hence, in December 1902, the United States offered no objection, and made no appeal to the Monroe Doctrine, over an occupation and bombardment of the ports of Venezuela by German, English, and Italian warships; the ground taken by President Roosevelt was that the Monroe Doctrine was not intended to protect American states from responsibility for their own defiance of the principles of civilized intercourse; but it was understood that the United States would under no circumstances permit the occupation of interior American territory even for a short time.

A few months later (22 Jan. 1903) Secretary Hay negotiated a treaty with Colombia for the construction and exclusive control of a Panama canal. The treaty was rejected by the Colombian government, and (3 Nov. 1903) the people of Panama revolted and set up a new republic, which was on 13 November recognized by the United States. The leading European governments at once followed in recognizing the new power, on the evident principle that the United States was the only great power which had responsibility for the relations of Latin-American states with each other. (See PANAMA.)

The Monroe Doctrine, so-called, has thus passed through many changes, ranging from the negative idea of Monroe that the United States

MONROVIA—MONT BLANC

was to see fair play in America, to the positive and aggressive plans of Polk and Fish, who asserted the right of the United States to enlarge at the expense of our neighbors; and thence to the broader doctrine of Olney and Hay that the United States must settle the interior affairs of America without interference from, or suggestions from, European powers. This doctrine has become a principle of American state policy which is courteously recognized by all other great powers.

ALBERT BUSHNELL HART,

Professor of History, Harvard University.

Monrovia, mŭn-rŏ'vī-ā, Liberia, the capital of the republic, a commercial and seaport town, on Cape Mesurado near the mouth of the St. Paul's River. It was named after James Monroe, President of the United States. Pop. 5,000.

Mons, môns, Belgium, the capital of Hainault, on the Trouille, 38 miles by rail southwest of Brussels. An encircling belt of promenades occupies the site of the fortified ramparts demolished in 1862. The Canal de Condé connects Mons with the Scheldt. The church of St. Waddru (1450-1589) is a masterpiece of Gothic; and there are a town hall (1458), a belfry (1662) 275 feet high, a good library, etc. The manufactures include woolen and cotton goods, cutlery, hardware, and sugar; while in the vicinity is the extensive coal field of Borinage. Mons, occupying the site of one of Cæsar's camps, was made the capital of Hainault by Charlemagne in 804. France, Spain, and Austria often contended for its possession. Pop. (1900) 25,483.

Mons. See MENSA.

Monseigneur, môñ-sā-nyêr (French, my lord), a title of dignity in France. Before the revolution the king's oldest brother was styled *monseigneur*. Princes, dukes and peers, archbishops, bishops, cardinals, marshals of France, presidents of parliament, etc., were addressed by this title.

Monsell, mŭn'sĕl, James Samuel Bewley, English Protestant Episcopal clergyman and hymn-writer: b. Londonderry, Ireland, 2 March 1811; d. Guilford, England, 9 April 1875. He was graduated from Trinity College, Dublin, in 1832, and took orders in the Church of England in 1835. As a writer of hymns he became famous, over 100 of his hymns still continuing in popular use. Among his publications are: 'Parish Musings'; 'Simon the Cyrenian and Other Poems'; 'Spiritual Songs'; 'Our New Vicar' (1867, 13th ed. 1890).

Monsignore, môñ-sē-nyô'rĕ, a title of honor given to prelates of the Roman Catholic Church. Formerly in France the corresponding

title of Monseigneur was allowed to all high dignitaries of the Church.

Monson, mŭn'sŏn, Sir Edmund John, British diplomat: b. Chart Lodge, Kent, 6 Oct. 1834. He was educated at Eton and Balliol College, Oxford; was fellow of All Souls, Oxford, 1858; had entered diplomacy in 1856; held various minor posts, as attaché or under-secretary, until 1876, when he was sent on special service to Dalmatia and Montenegro. He was minister to Uruguay (1879), to Argentina and Paraguay (1884), to Denmark (1884), to Greece (1888), and after acting as arbitrator of the Butterfield claims between Denmark and the United States in 1888, minister to Belgium 1892, and ambassador to Austria 1893, and now to the French Republic. He was made a privy councillor in 1893.

Monsoons, mŏn-soonz', in meteorology, are certain trade winds, operative from the tropic of Cancer to lat. 7° S., and from the coast of Africa through the Indian Ocean and the Bay of Bengal to Japan and the Western Pacific. There are two monsoons, the southwestern and the northeastern. The latter prevails from October to April, and the former from April to October. Monsoons are caused by the unequal heating of the land and water and of the several land masses themselves in the regions which they affect. Independently of their great use in bringing rain to countries which otherwise would degenerate into deserts, they are useful for navigation. As in the case of the trade winds, navigators can so plan their voyages as to take advantage of the monsoons, though powerful steamships can now achieve the feat of running in the teeth of the monsoon, but not without some discomfort to those on board.

Monsters. See TERATOLOGY.

Mon'strance (Latin, *monstrare*, to show), called also *ostensorium* or *expositorium*, the sacred vessel in which, in the Roman Catholic Church, the host is shown to the people, through a glass-covered opening, at benedictions, processions, and other solemnities. Its use dates from the institution of Corpus Christi Day (1264) by Pope Urban IV. It was not until after the Council of Cologne 1452 that the consecrated wafer was exhibited to the people, having been previously deposited in the ciborium which enclosed and concealed it.

Mont Blanc, môñ-blŏn (white mountain), France, a mountain, the loftiest of Europe, belonging to the Pennine chain of the Alps, and rising 15,781 feet above sea-level, the main portion and the highest summit being in France (Haute Savoie), 7 miles south of the Switzerland frontier. It forms a huge mass stretching northeast and southwest, in which direction the boundary line between France and Italy runs along it. Its northeastern extremity enters Switzerland. In this latitude the snow line is at 8,000 feet; consequently 7,700 feet of the mountain are within the region of perpetual snow and ice. Its shape, when seen on the north or south, is pyramidal. On the southeast it presents an immense wall-face, on which few glaciers can be formed. These, of which 18 in all are counted, are chiefly on the northwest slope, where the glaciers Des Bossons, Bois, Talèfre, and Mer de Glace are seen. The mass of the mountain consists almost entirely of granite. In 1760

MONT CENIS—MONTAGNARDS

Saussure offered a prize for the discovery of a practicable passage to the summit, which was reached by Jacques Balmat, a guide, June 1786. The "Grande Ascente" is now an ordinary tourist excursion, regularly made every season by great numbers, and is less hazardous than commonly supposed, unquestionably due to the precautions taken by government to ascertain the qualifications of the guides, and regulate the mode of ascent. In 1893 an observatory was erected on the summit of the mountain by Pierre Janssen.

Mont Cenis, môn sê-nê, or **Monte Cenisio**. See **CENIS**, MONT.

Mont Cervin, môn sêr-văn. See **CERVIN**, MONT.

Mont Pelée, môn pā-lā. See **PELÉE**, MONT.

Mont-de-Piété, môn-dê-pê-â-tâ (in Italian *Monte di Pietà*), an authorized licensed or government pawnshop; a bank of charity which lends money on pledges at a low rate of interest, and whose aim is purely philanthropic. The chief customers of such institutions, which are found in France, Italy, Germany, and other continental countries, are workmen pressed by a temporary failure of employment; small tradesmen without a bank account; or travelers in a large town whom some accident has subjected to a momentary strait; to all of whom it is a matter of necessity to conceal any compromise of their position in procuring money for present necessities. These institutions were established to prevent the scandal and abuse of usury. They date their origin from the Middle Ages, when the loan of money on pledges was almost exclusively in the hands of the Jews. They originated in Italy about 1450, and not long after were approved by several papal bulls. Several French and Italian cities possessed *monts-de-piété* in the latter half of the 15th century, among others, Mantua, Parma, Milan, Rome, Padua, Trèves, Boulogne, etc. The French *monts-de-piété*, with the exception of those of Montpellier, Toulouse, Grenoble, and Angers, which lend without interest, exact interest at the rate of from 4 to 12 per cent. The chief *mont-de-piété* in France is that of Paris, which transacts a greater amount of business than all the rest together. It is said to receive in pledge as many as 1,000 to 1,200 watches a day. In the United States and Great Britain pawnbrokers take the place of *monts-de-piété*, which were introduced in the beginning of the 18th century, but failed. See also **PAWN-BROKERS**.

Mont - Saint - Michel, môn - sãn - mē-shêl, France, a famous seat of learning and pilgrimage resort of Normandy as early as the 12th century, now an equally celebrated tourist resort. It consists of a collection of mediæval houses, hostels, ecclesiastical buildings, and fortifications, grouped on a conical rock in the Bay of Cancale or Saint Michel, at the mouth of the Couesnon River, here forming the boundary between Normandy and Brittany, 15 miles southeast of Granville. Anciently a lofty hill in the Forest of Scissy which was submerged in the 7th century by a tidal cataclysm, the rock in prehistoric times was crowned by a Celtic temple; it was the Roman *Mons Tumba*, and the "*mons in periculo maris*"—the mount in danger of the sea—of the monastic chroniclers. The Bay of Saint Michel, 15 miles wide at its mouth, and 8

miles long from north to south, is nearly dry at low water, but fills with treacherous rapidity at flood tide. In 1880 a dyke nearly a mile long was completed which connects the Mont with the mainland. Ramparts, towers, and bastions of the 16th century encircle the base of the rock which has a circuit of about two miles, and the entrance is through a gate which opens on the single, narrow, winding street of a small village (pop. 1901, 235) built around the southern slope and leading by several flights of stone steps to the fortified abbey on the summit. Crowning the abbey is a superb 15th century Gothic church, a fine statue of the Archangel Michael capping the spire, which towers conspicuously 250 feet above the wide expanse of sandy bay and low-lying country around. Saint Aubert, bishop of Avranches, founded the abbey in 709 and his first chapel, restored, is on a rocky projection on the north side of the Mont. In 1203 the abbey was destroyed by Philip Augustus, and the present buildings date from that period. It was an important fortified post during the English and religious wars and was successfully defended against all assaults by the Knights of the Order of Saint Michael. At the Revolution it was converted into a prison for political offenders, and now ranks as one of the protected historical monuments of France. An elaborate process of restoration extending over several years is gradually renewing its ancient strength and beauty. Among the chief features of the Mont are the abbey church, elaborately decorated cloisters, La Merveille "the marvel," or massive north wall of the abbey, the Salle des Chevaliers, the Châtelet or guard house, the crypts with their remarkable columns, the cellars, the dungeons, the mediæval elevator with its enormous hoisting wheel formerly operated by a donkey, etc.; and in the village the ancient parish church, a museum, the famous Porte du Roi, and Duguesclin's Tower.

Montagna, Bartolommeo, bār-tō-lōm-mă'ō môn-tăn'yā, Italian painter: b. Orzinovi, near Brescia, about 1450; d. Vicenza 11 Oct. 1523. He settled at Vicenza in 1480, was influenced by Bellini, Carpaccio and Andrea Mantegna, worked in Padua and Verona, and from 1496 until his death was again in Vicenza, being the first great master resident there. His work in general resembles the earlier Venetian school, is serious, marked by distinctness, power and severity of drawing, and has harmonious coloring in which a brown gleaming tint is noticeable. The human form is almost always shown as over-muscular. His principal works are the 'Madonna and Child' at the Venice Academy, 'Ecce Homo' at the Louvre, and frescoes in the church of San Nazaro at Verona.

Montagnais (môn-tăn-yā) Indians, a general name applied to several American Indian tribes. One of these was of the Athapaskan family in British North America, the most of whom were Christianized by Roman Catholic missionaries. Another and the best known tribe of this name, was of the Algonquian family, and resided along the shores of the Saint Lawrence River. They have practically disappeared in recent years.

Montagnards, môn-tăn-yār, a popular name in French history, applied in 1793 to the

MONTAGU — MONTAIGNE

extreme democratic party. Soon after the fall of Robespierre the denominations of "Montagnard" and "Montagne" gradually disappeared from party nomenclature. An attempt was made by the extreme party in the National Assembly, after the revolution of 1848, to revive the title, but it was a pure anachronism.

Montagu, mōn'ta-gū, Andrew Jackson, American lawyer and politician: b. Campbell County, Va., 3 Oct. 1862. He was graduated from Richmond College in 1882 and studied law taking the degree of B.L. at the University of Virginia. He was admitted to the bar and began the practice of law in 1885; from 1894 to 1898 he was United States district attorney for the western district of Virginia, and in 1898-1902 attorney-general of the State. In 1902 he was elected governor of Virginia for a term of four years. He has been one of the foremost advocates of direct primaries to prevent party machine rule. He has also been active in the movement for improved popular education in the South, and has given many public addresses throughout the State, advocating the increase of educational facilities for all without regard to race or creed.

Montagu, Elizabeth Robinson, English author and society leader: b. York 2 Oct. 1720; d. London 25 Aug. 1800. In 1742 she married Edward Montagu, grandson of the first Earl of Sandwich, who died leaving her a fortune. To wealth she added literary accomplishments, and these, joined to other personal qualities, enabled her to secure her social leadership. Among her visitors and associates were Lord Lyttelton, Samuel Johnson, Horace Walpole, Burke, Sir Joshua Reynolds, Garrick, Hannah More, and other celebrated persons. To the gatherings at her house the term blue-stocking (q.v.) is said to have been first applied. Three of the dialogues in Lord Lyttelton's 'Dialogues of the Dead' were written by her in 1760. She also wrote an 'Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets' (1769). Much of her correspondence was published (1809-13). Consult the 'Memoirs' of Elizabeth Carter (1816), and Doran, 'A Lady of the Last Century' (1873).

Montagu, Lady Mary Wortley, English author: b. 1689; d. 21 Aug. 1762. She was the eldest daughter of Evelyn Pierrepont, afterward Duke of Kingston. She learned Latin very early, and also became versed in English literature, especially its romance and drama. The Kit-Cat Club (q.v.) by acclamation admitted her to membership. In 1712, without the consent of her father, she married Edward Wortley Montagu, a wealthy Whig scholar, with whom the former had quarreled. On the accession of George I. in 1714 Montagu obtained an official position in London, and Lady Mary came out from the seclusion in which she had lived. Her beauty, wit, and vivacity gained her admiration and influence, and she became familiarly acquainted with Addison, Congreve, Pope, and other distinguished writers. In 1716 her husband was appointed ambassador to Turkey, and Lady Mary accompanied him to Constantinople, where they remained from January 1717 to May 1718. During this period her famous 'Turkish Letters' were written. On her return to Eng-

land she re-entered the world of wit and fashion. She had a quarrel with Pope, and a long and keen literary war ensued, which did honor to neither. In 1739, for reasons never satisfactorily explained, she left England to live on the Continent. This she did with the full concurrence of her husband. She lived chiefly in Italy until her husband's death in 1761, and soon after her return to England she herself died. Her letters are marked by great sprightliness, combined with graphic power and keen observation, and with independence of judgment. Lady Mary has another claim to remembrance in her courageous adoption for her own children of the Turkish practice of inoculation (q.v.) for smallpox, and for her energy in promoting its introduction into England, in the face of violent prejudice. Consult her 'Works,' edited by Lord Wharncliffe, her great-grandson (1837, latest ed. 1893).

Montague, Mass., a town including several villages, in Franklin County; on the Connecticut River, and on the Central Vermont and the Fitchburg railroads; about 35 miles north of Springfield. The most important village in the town is Turner's Falls. Montague was settled about 1716 and in 1753 was incorporated as a district. It is in an agricultural and manufacturing region. The chief industrial establishments are large cotton mills, paper and pulp mills, brick, water-wheels, hardware, cutlery, pumps, toilet articles, soap, and machinery. There are two public libraries. The government of the town is determined by popular vote at regular town meetings. Pop. (1890) 6,296; (1900) 6,150.

Montaigne, mōn-tān' (Fr. mōn-tān-yě), Michel Eyquem de, French essayist: b. Château Montaigne, Périgord, 28 March 1533; d. there 11 Sept. 1592. He was educated by his father after a fashion all his own, learning Latin from house servants who never spoke French and being roused from bed every morning by soft music. At six he was sent to the Collège de Guyenne in Bordeaux, where he stayed for seven years apparently under the charge of the great classical scholars Buchanan and Muretus. Thereafter he probably studied law at Bordeaux and Toulouse, and when he came of age was made a member of the Cour des Aides at Périgueux. This court was abolished three years afterward and Montaigne with the other members was appointed counselor to the Bordeaux parliament, a body in which he made the acquaintance of La Boétie about 1559. For the next few years he was at court now at Paris, now at Bar-le-Duc; we know that in 1562 he swore allegiance to the Catholic Church on his own motion, that in 1565 he married Françoise de la Chassaigne, daughter of one of his fellow counsellors, and that the death of La Boétie in 1563 and that of his father in 1568 had greatly lessened Montaigne's interest in public affairs. These events had also no doubt sobered him—he admits that his youth had been wild; at any rate in 1571, having prepared La Boétie's posthumous works for the press, having received himself the order of St. Michel for a rather mediocre version of the 'Theologia Naturalis' of Raymond de Sebonde, his only literary venture so far, after selling his post as counsellor, he retired to Montaigne. There he began, and in the next nine years com-

MONTALEMBERT

pleted, the first two books of his essays, whether purposing them for publication or not is unknown, though their style seems to point to the fact that in their earliest form they must have been mere jottings in a commonplace book. By the middle of 1580 his health had so much failed that he left Château Montaigne for the first time since 1571, save for an occasional trip to Paris, and traveled through Switzerland, Germany, and Italy, meeting Tasso at Florence. His 'Journal' of this trip, discovered and published in 1774, adds nothing to his literary fame and not much more to our knowledge of his personality. During this absence from France, and apparently quite against his will, Montaigne was elected mayor of Bordeaux; he served in this office from 1581 to 1583 and then was re-elected for another two years; at the close of this successful administration, in which with no small skill he had steered safely the king's lieutenant in Guyenne and the king of Navarre, governor of the province, he refused to be present in the city as was required for the election of his successor, because of the plague—one of the few lights on his personal character and not a pleasant one. The three years immediately following (1585-8) were occupied in the revision of his two books of essays and the addition of a third. He received the rites of the Church upon his death-bed. His wife bore him several children; "two or three," he says, died in infancy; and one, a daughter of whom he was very fond, survived him. But his family ties were not strong; his life with his wife seems to have been a philosophic makeshift; and his love for his daughter can not compare with his attachment to a Parisian girl, Mlle. de Gournay, who was attracted to him by his literary fame, was called by him his adopted daughter, and was fortunate enough to receive from Montaigne's widow a copy of his 'Essays' with manuscript additions and corrections, the basis of a new edition, published in 1595. Montaigne's literary reputation is safe, though in the hands of the few, not the many. His spirit is skeptical, essentially typical of his time, and it was not for nothing that his study at Château Montaigne was decorated with texts from Ecclesiastes, Ecclesiasticus, Lucretius and Horace, for he was akin to these ancient writers who proclaim the vanity of all things. His theme is varied, his treatment discursive, and his charm largely due to this very variety, together with a quaintness and raciness of style that did much for French prose and was mostly original even if patterned on Amyot. His manner of approaching the questions of life and criticism is apparently purely subjective; indeed, his delightful egoism that makes his own life, experiences, and thoughts the theme of the essays seems at first to be quite independent of so serious a purpose. But this subjective manner brings him nearly as close to the analysis of universal problems as does the dramatic objectivity of a Shakespeare. His entire attitude is skeptical, but he is not to be ranked as the enemy of religion. He is the curious, interested skeptic, not the doubting cynic. Prof. Saintsbury well says that the nearest spiritual parallel to Montaigne in literature is Charles Lamb.

Montaigne affected English literature scarcely less than he did French. His essays, translated by Florio (1603), seem to have been known to Shakespeare in their English form, and this

same version, revised by Hazlitt (1803), is still the standard in English. The best editions of the original are those by Amaury-Duval (1820) and Le Clerc (1865). Consult the appreciations by Emerson, 'Representative Men' (1850); Church, 'Miscellaneous Essays' (1888); Pattison, 'Essays' (1889), and Pater, 'Gaston de Latour' (1896); also Bonnefon, 'Montaigne et ses Amis' (1892); Stapfer, 'Montaigne' (1894); Lowndes, 'Michel de Montaigne' (1898); Guizot, 'Montaigne' (1899); Champion, 'Introduction aux Essais de Montaigne' (1900).

Montalembert, Charles Forbes de Tryon, shārl fōrb də trē-ōn mōn-tā-lōn-bār, COMTE DE, French publicist and historian: b. London, England, 29 May 1810; d. Paris 13 March 1870. He received a university education at Paris; identified himself with the Liberal Catholic movement of Lamennais (q.v.) and Lacordaire (q.v.), whom he assisted in establishing (18 Oct. 1830) and editing 'L'Avenir' and in efforts to obtain the freedom of education at that time impossible under the state system, and in 1831 went with these two leaders to Rome to present their cause. On his return he opened with Lacordaire and De Caux at Paris a free Catholic school, which was promptly closed by the police, while the directors were arraigned for infringement of the laws respecting instruction. Montalembert made a notable defense before the Chamber of Peers, but the directors were sentenced to pay the costs and 100 francs apiece in fines. When the doctrines of 'L'Avenir' were condemned by Gregory XVI. in an encyclical of 15 Aug. 1832, Montalembert duly submitted and did not proceed with Lamennais to final revolt. He entered the Chamber of Peers in 1835, spoke much and eloquently on ecclesiastical matters, and in 1836 published his 'Histoire de Sainte Elizabeth de Hongrie,' which appeared in an English rendering by Hackett and Sadlier (1854). His Catholic zeal was combined with liberal ideas and after the revolution of 1848 he was elected as a Moderate Republican to the Constituent Assembly; but here, as in the Legislative Assembly, where he sat from 1849 to 1857, he became more and more conservative. In June 1851 he debated against Victor Hugo in opposition to the proposed constitutional revision. He found himself unable to support the measures of the Empire; was known as one of the most determined opponents of Napoleon III.; and for an article, 'Un Débat sur l'Inde au Parlement Anglais,' unfavorably contrasting French and British institutions, was sentenced to six months' imprisonment and a fine of 3,000 francs, though the penalty was remitted. His chief work is 'Les Moines d'Occident depuis St. Benoît jusqu'à St. Bernard' (1860-7; Eng. trans.), which, though of much value, has been criticized as in general too argumentative and oratorical in manner to fulfil the highest demands of history. He wrote many pamphlets, the last of which, 'La Victoire du Nord aux Etats-Unis' (1865; Eng. 1866), was an appreciation of the triumph of the Union cause in the Civil War. He opposed in a letter of 28 Feb. 1870 the opportuneness of the definition of the doctrine of Papal infallibility, but acquiesced at once when the dogma was published. Consult the memoir by Mrs. Oliphant (1872); the study by De Meaux (1897); Craven, 'Le Comte de Montalembert' (1873).

MONTANA

Montana, mŏn-tă'na, the "Treasure State" (admitted to the Union 8 Nov. 1889), is bounded north by British Possessions, east by North Dakota and South Dakota, south by Wyoming and eastern Idaho, west by Idaho. Capital, Helena; area, 146,080 square miles. (about 1,000 of it water); population (1900) 243,329, including 11,343 Indians and 5,703 Chinese, Japanese, and Negroes.

Topography.—The State has within its borders 93,491,200 acres of land. Of this amount about 26,000,000 acres are classed as mountain lands, 30,000,000 as farming lands, and 38,000,000 as grazing lands. This is approximately 40,000 square miles of mountains, 50,000 square miles of farming lands and 56,000 square miles of grazing lands. The mountain area of the State is about equal to the area of either Indiana, Kentucky, Virginia, Ohio or Tennessee; its grazing land is more than the area of either Pennsylvania, Louisiana, Mississippi or New York; its farming land is as much as the area of either Wisconsin, Iowa, Illinois or Michigan. The mountain area is largely in the western part. The main range of the Rocky Mountains enters the State about a hundred miles east of the State line, and extends across the State from northwest to southeast, forming the boundary line between Montana and Idaho for several hundred miles—from 114th meridian to the Yellowstone Park. The crest of the range is quite tortuous, and contains many peaks. West of the main range of the Rockies are several smaller ranges. The Bitter-Root Mountains form a large part of the boundary between Montana and Idaho, from 48th parallel to juncture with the main range of the Rockies. The northern portion of the State west of the main range includes the Kootenais, which extend northward into the British Possessions. Between the Kootenais and the Bitter-Root range are the Cabinet Mountains, extending approximately southeast and northwest, continuing westward into Idaho. They form the western boundary of the Flathead Indian reservation, the lower summits blending with the Mission range near Missoula. The Mission range extends almost due north and south for about a hundred miles, the northern end beginning in the valley at the upper end of the Flathead lake, rising higher and higher toward the south, culminating in the McDonald Peak (9,800 feet), Sinyaleamin Peak (9,500 feet), and McLeod Peak (8,500 feet). East of the Mission range lies the Swan range, extending almost parallel with the former, and continuing some 30 or 40 miles farther north. Like the Mission Mountains, the Swan range is highest at the southern end, culminating in Swan Peak (10,000 feet). East of the main range are many smaller ranges, foothills leading from the Great Plains to the Continental divide, with its high and snowy peaks. The Big Belt Mountains form the boundary between Meagher County on the east side, and Broadwater and Lewis and Clarke counties on the west. The range extends northwest and southeast for more than a hundred miles. In the southwest angle of the State, adjacent to the National Park, are many small ranges, including the Ruby Mountains, the Tobacco-Root range, the Snow-Crest range, the Madison range, the South-Boulder range, the Gallatin range, Bridger Mountains and Snow Mountains. Near the Wyoming line on the south is the small Bear-

Tooth range, the Prior Mountains, the Rosebud range, with a high plateau in the southeast corner. The Little Belt Mountains form a large portion of the boundary between Meagher County and Fergus and Cascade counties. Between this range and the Big Belts lie the small Dry-Range and Elk Mountains, while the Crazies are further to the southeast, and are the first high summits to greet the traveler on the Northern Pacific railroad as he speeds westward between Big-Timber and Livingston. Fergus County, in the central part of the State, is as large as the State of Massachusetts. It contains the Big Snowy and Little Snowy ranges and the Moccasin Mountains. North of the Missouri River the State is largely a great plain, broken by the Bear-Paw range, culminating in Mount Garfield (5,794 feet), and the Cherry Patch hills at the northern boundary. The mountains contain many high peaks, the more lofty being in the Yellowstone Park (q.v.) region. Much of the mountainous region is yet unexplored save by the hardy trapper and prospector. The transcontinental railroads give the traveler a poor idea of the sublimity of the scenery which the many mountain ranges afford. Many of the snow-clad peaks bear on their sides the remnants of glaciers with miles of blue ice with huge crevasses, where the Alpine climber may find untrodden and unnamed fields, where the blue lakes reflect the azure depths of heaven, and where the botanist, the zoologist, the geologist, as well as the artist, may find a virgin field. Many of the peaks, lakes, glaciers and creeks are unnamed. Some of the more important summits, other than those mentioned, are the following: Mount Powell, Deer Lodge County, 12,000; Chief Mountain, 10,000; Mount Lo Lo, Bitter-Root range, 9,500; Saint Mary, Bitter-Root range, 9,500; Electric Peak, near the Park, 11,155; G. N., 10,000; Gallatin, 10,967. The greater portion of the State lies east of the Rockies. Most of this section may be classed with the Great Plains region, traversed as it is by the mighty Missouri and its tributaries. Part of this Great Plains portion of the State is high and rolling, eminently adapted for grazing; but a large portion is adapted to farming, when irrigated, and will supply farms and homes for thousands of families in the years to come.

River Systems.—The waters from the mountains of Montana are carried by different river systems to the three oceans, the Arctic, the Pacific, and the Atlantic through the Gulf of Mexico. In the western part the Bitter-Root River gathers the waters from the snow crests of the Bitter-Root range and from the spurs of the Rockies, and unites with the Missoula near the city of Missoula. The Missoula River through its various tributaries gathers the waters from a large portion of the western slope of the main range, including that which is used in the great smelters of Anaconda, and that which comes from the rich mines of Butte. Further north, the North Fork, Middle Fork, and South Fork of Flathead River, receive the drainage from the Mission and Swan ranges, the west slope of the main range, and a part of the Kootenais. These unite to form the Flathead River, which first pours its waters into the greatest reservoir of the State, Flathead Lake, and later joins the Missoula in the beautiful but narrow Paradise Valley to form Clarke's Fork of the Columbia. The Kootenai River

MONTANA

takes the drainage from the extreme northwest corner, a part of the Columbia drainage system. The rivers on this western side are clear and swift, with rocky and picturesque cañons. The Belly and Saint Mary rivers in the northern part of the main range carry the ice cold water from the glaciers of the Chief Mountain and the region adjacent on to the Arctic Ocean. The sources of these two rivers are in the wildest and most picturesque portion of the State. If the plans of the National Government are executed, much of the waters from the Saint Mary will be diverted to the Milk River, and used in the vast system of irrigation under contemplation. Mount Stimpson (10,000) claims the proud distinction of sending its waters to three oceans. By far the greater portion of the State is in the Missouri River drainage system. The Madison, Gallatin and Jefferson rivers gather the waters from the many small ranges adjacent to the Park and unite at Three-Forks to form the Missouri. Near the city of Great Falls are the "Falls of the Missouri," from which place the river is navigable to its juncture with the Mississippi. The Yellowstone River rises in Yellowstone Lake in the Park, and after taking its two mighty leaps in the Park and flowing through its magnificent gorge, it emerges as a restless river, continuing in swift descent until its waters merge with the muddy Missouri. The Yellowstone is the most rapid navigable stream in the world. From the north the Missouri receives the waters of the Marias, Teton, Sun and Milk rivers, all of which flow through valleys of great fertility. The scenery along the rivers is varied, and exhibits some striking antitheses. The valley of the Bitter-Root is one of remarkable beauty. The river, as it winds back and forth like a stream of silver, when viewed from Mount Lo Lo, Ward's Peak, or Saint Mary's in the Bitter-Root range, is probably equalled in quiet and peaceful grandeur only by the Yellowstone as it flows through Hayden Valley in the Park. The three branches of the Flathead present to the few travelers along their course many gorges and cañons. The South Fork in one place in the Lewis and Clarke forest reserve has cut its way through solid rock, making a cañon so narrow that pack horses may be and are forced to leap from brink to brink, while the river seethes and boils many feet below, its ominous roar announcing certain death if the leap is short. The Missouri has made the famous "Gateway of the Mountains," its splendor first told by Lewis and Clarke, and later made famous by the brush of artists. At the city of Great Falls, it hastens its speed before tumbling over the beautiful Black Eagle falls, spanned by a bridge on the Great Northern railroad, and does not diminish its speed until the bottom of the Great Falls is reached. The valleys of these rivers and their smaller tributaries make rich farming soil, suitable for grain, vegetables, and fruit. The Bitter-Root Valley in the west was settled first, and is a great farming and fruit raising region. The country adjacent to Flathead Lake is thickly settled, and produces abundant harvests without irrigation. The Gallatin Valley has become famous for its bountiful harvests, and the Yellowstone is being largely used for agriculture and fruit. The northern tributaries of the Missouri, while watering very fertile valleys, are in a thinly settled region.

Climate and Rainfall.—The climate of the State is exceedingly varied, and is much more salubrious than is generally supposed. West of the range the winters are mild, the summers and falls are delightful. The rainfall at Missoula and Kalispell averages about 16 inches, while at Culbertson and Glendive in the eastern end the rainfall is about 13 inches. Rain and snow prevail during the spring until early July. July, August and September are largely without rain, although in many places there is no need of irrigation. Owing to the different altitudes, snow may fall later in the spring at some places than at others. An area of 40,700 square miles is below 3,000 feet elevation above the sea; this is equivalent to a State the size of Georgia. About 10,200 square miles exceed 8,000 feet altitude. The climate on the Pacific slope is milder and less changeable than that of the Atlantic side. The majority of the areas of high barometer, and accompanying cold, originate in the Arctic region, and are deflected southward or eastward by the Rocky Mountains. While eastern Montana and the Dakotas may be in the throes of a blizzard the western end may be enjoying balmy weather. The coldest weather at Missoula for 7 years is -22° F., while during some winters the thermometer does not go below zero. The mean temperature in the western end is 44° F. At Helena, altitude 4,500, the mean maximum is 43.1. Chinook winds may occur over the entire State, melting large quantities of snow in a short period of time. Owing to the usual absence of a high percentage of humidity, the cold weather is not extremely disagreeable, nor the warm days smotheringly oppressive. The hot days may blister the skin, while the nights following will be cool enough to require blankets. Rarely does one sleep without considerable covering, and some people wear the same clothing summer and winter, donning extra coats or wraps in winter. This may be given as the general summary: the springs are rainy; the summers are clear and dry; the autumns are delightful; the winters are clear and bracing. Owing to the absence of high humidity the climate is very beneficial to health, as statistics will show. It is especially beneficial to those affected with pulmonary diseases.

Agriculture and Husbandry.—In the early days of Montana's history it was not thought possible to grow crops in the State to much extent. Nearly everything was shipped in from the outside. As the mines developed the demand for food became so great as to stimulate agriculture, and fruit raising was also attempted. Marked success attended the efforts, and large acreage of grain and orchards were put out annually, until agriculture and husbandry have developed into important economical features in the State's progress, and bid fair to rank close to the mineral wealth in the near future. In 1902, nearly 250,000 fruit trees were set out; the number was almost doubled the succeeding year. At the close of the year 1903, nearly 1,500,000 fruit trees had been set out in various parts of the State. The harvest in that year was 250,000 bushels of apples. The trees in the orchard include apples, cherries, plums, apricots and peaches. Small fruit, such as gooseberries, strawberries, blackberries, currants, and the like, produce enormous crops from small acreage, while to describe the size and weight of the fruit

MONTANA

is almost beyond belief. Apples are shipped to the eastern States and even to England. As they are remarkably free from insect pests, owing to the stringent legislation and watchful care in orchard inspection, home-grown apples are always in demand, the demand being far in excess of the supply. As a small part of the total number of trees bore fruit at the beginning of 1904, the insufficient supply is accounted for, but the crop of the orchards will increase in amount very rapidly. The Bitter-Root Valley, in the western part of the State on the Pacific slope, is the oldest orchard section, and is fast becoming famous as a fruit growing valley. But the orchards are not confined to this beautiful and fertile valley. The valley to the north of Flathead Lake is filled with orchards already breaking beneath their loads of fruit. The Yellowstone Valley is developing rapidly as a fruit-growing region, even growing grapes. The most recent observations show that fruit trees may be grown and that apples will mature in every portion of the State, and apples are now grown in every county of the State with but a few exceptions. Horticulturists insist that fruit trees may be grown in every county of the State. Since the portion of the State east of the Rocky Mountains is much greater than on the west the fruit growing possibilities of the State may be readily understood when it is known that the great majority of the fruit trees of the State are on the Pacific side. The total value of farm property in 1900 was \$117,859,823, an increase of 143.1 per cent in ten years; that of farms, including farm improvements and buildings, \$36,513,750, an increase of 143.1 per cent in ten years; that of implements and machinery, \$2,315,890, or 170.8 per cent; and that of live stock, \$30,541,146, or 141.3 per cent increase. The value of farm products for 1899 exceeds that reported for 1889, by \$22,343,542 or 356.2 per cent increase. Of the total land area of the State 11,844,454 acres, or 12.7 per cent, were included in farms in 1900. The average size of the farms was 885.9 acres, of which 14.7 per cent was improved land. The total number of farms was 13,370, an increase of nearly 250 per cent in the decade. The total acreage in farms in 1900 was almost 85 times that reported in 1870. Eastern Montana contains more than three fifths of the total area of the State. In the extreme eastern part are the "Bad Lands," a continuation of the "Bad Lands" of the Dakotas, Wyoming and Nebraska, practically non-irrigable because of the uneven surface. The Yellowstone Valley has become famous for its growth of alfalfa. Two or three cuttings, a total of 4 to 7 tons per acre, are had. The Gallatin, Madison and Jefferson valleys in the southeast produce rich harvests of cereals, never failing through irrigation. In the west the Bitter-Root, Missoula and Flathead valleys, while less extensive, produce as abundant harvests, often without irrigation. The lands are of three general classes—the bottom lands, near the streams, with rich, black, alluvial soil; the bench lands, whose soil is a sandy loam, capable of wide range of cultivation; and the high bluffs, suitable largely for grazing. Experiments in "dry land farming," farming on the uplands without irrigation, in 1903, indicate that good crops may be grown in this way, and the method is encouraged by the experiment station; 90.8 per cent of the farms are operated

by the owners thereof. The entire Crow Indian reservation is included in the statistics as one farm, thus making the average size quite large. Nearly 300 farms were operated by Indians, 26 by Chinese and 21 by negroes. This was about 0.4 per cent of the total farm acreage. The government plans for irrigation will reclaim large tracts of land and put it under cultivation. The crops raised are corn (75,838 bushels); wheat, (1,899,638 bushels); oats, (4,746,231 bushels); barley (844,140 bushels); rye (33,120 bushels); hay and forage, (1,059,361 tons); dry peas (32,265 bushels); potatoes, (1,332,062 bushels), in 1899, other crops in small quantity, making a total valuation of \$10,692,515. During the past few years, many small fruit and truck farms have been started, promising greater returns per acre and greater variety of farm products, as ready market awaits all kinds of farm products. Montana leads the Union in the number of sheep, there being more than 5,000,000 in 1902. The sheep industry has proven profitable in the eastern portion where there is much open range. Few herds are to be found west of the range. The fleeces weighed 35,500,000 pounds, valued at over \$6,000,000. In 1902, there were 750,000 of cattle and 200,000 of horses, the assessed valuation of the former being \$3,121,000, and of the latter \$3,900,000.

Timber and Lumber.—Twenty-nine per cent of the total area of the State is covered with timber, which is 8 per cent less than for the average of the entire United States. The timber growth is largely of coniferous trees, yellow pine, tamarack, and Douglas spruce, comprising the most of the commercial product. Along the streams occur forests of cottonwood. In the drier portions of the State, stunted red cedars often grow along the smaller water courses, of great value to settlers, as they supply posts and wood. Forests of white cedar or arbor-vitæ, white pine, and Engelmann's spruce occur in the western part. On the higher slopes and summits the alpine species thrive; but as they are limbed to the base of the tree and inaccessible, they are not of value commercially. They are useful in preventing the rapid melting of the snow in the spring, holding it until later in the season when it is needed in irrigation. A considerable portion of the State's timbered area is included in government forest reserves. On the west the Bitter-Root reserve includes a portion of the Bitter-Root range within the State, and since the higher summits are not in the watershed of the range, but far to the east of it, the reserve includes territory from which comes the water to irrigate the fertile Bitter-Root Valley. In the north is the Lewis and Clarke reserve, formed by the union of the original Lewis and Clarke reserve, the Flathead reserve, and a narrow strip along the Great Northern railroad which was originally not included in either. In the southeastern part is the Gallatin reserve. In 1902, the same year in which the proclamation was made for the Gallatin reserve, proclamations were issued setting aside the Little Belt Mountain reserve, the Madison and the Absaroka reserves. The area embraced in each is as follows:

1. Lewis and Clarke, 6,732 square miles, or 4,308,480 acres, not including the narrow strip along the Great Northern Railway.
2. The Bitter Root, 6,480 square miles, 450,000 acres of which are in Montana, the remainder in Idaho.
3. The Gallatin, 63 square miles, or 40,320 acres.

MONTANA

4. The Little Belt, 503,040 acres, including the town of Nehart and the Yogo sapphire mines.
5. The Madison, 800,000 acres.
6. The Absaroka, 1,385,600 acres.

The total of all land in government forest reserves in the State in 1902 was 7,487,400 acres, nearly 11,700 square miles, or about one thirtieth of the total land area of the State. The total output of the lumber mills in 1902 was 210,047,000 feet of rough timber, 5,500,000 shingles, and 17,000,000 lath. The United States Geological Survey in 1902 estimated all of the merchantable timber on all of the reserves in the State at 14,974,800,000 feet. On State land there was estimated to be 912,000,000 feet, making the total estimate of merchantable timber on State or government lands 15,886,800,000 feet. This estimate does not include timber in the Northern Pacific land grant, nor on the land belonging to private owners and milling companies. At the present rate of consumption, the timber on the State and government lands would satisfy the mills as running in 1902 for about 70 years.

Mines and Mining.—Montana has been known principally on account of her mines, and leads in the production of copper and in the output of sapphires. The early history of the State is the search for gold, and many of her towns and cities are built in gulches where placer gold was mined. Virginia City and Helena are illustrations, the former being the oldest camp in the State. Although Butte is the greatest mining camp in the State, and indeed the greatest in the world, it is by no means the only place where mining is carried on. In 1900, mining for gold and silver was carried on in the following counties: Beaverhead, Broadwater, Cascade, Choteau, Custer, Deer Lodge, Fergus, Flathead, Granite, Jefferson, Lewis and Clarke, Madison, Meagher, Missoula, Park, Ravalli and Silver Bow. Lewis and Clarke was the greatest producer with 70,000 fine ounces of gold and 172,531 fine ounces of silver. The total product of gold and silver in the State in 1900 was 229,114 ounces of the former and 14,294,835 of the latter. In 1901 there were 232,331 ounces of gold and 14,180,545 ounces of silver. During the 40 years following the discovery of gold in the State over \$1,000,000,000 in value of gold, silver, copper and lead have been taken from the streams and mountains of the State. While Butte is the mining camp for copper, it is also mined in the counties of Beaverhead, Granite, Jefferson, Lewis and Clarke, Madison, and Meagher. Butte, in Silver Bow County, produced 227,742,262 pounds of the total of 228,031,503 pounds from the State in 1901. Lead was produced in all the counties mentioned except Madison, and in addition also in Broadwater, Cascade and Flathead. The total lead output in that year was more than 11,500,000 pounds, and in 1902 it was nearly 16,000,000. Montana is one of the richest coal States in the West, although much of it is undeveloped. Over 2,000,000 tons were mined in 1902, and new mines are being opened annually. The cretaceous, bituminous and semi-bituminous coal areas in the State cover about 13,000 square miles, and the lignite area about 25,000. Not all of this territory contains coal, of course, but the deposits are found quite abundantly throughout the territory. The tests show the bituminous coal to be but little inferior to Pennsylvania bituminous coals. Bituminous coal or lignite has been found

in every county of the State except Jefferson. The undeveloped coal industry will without doubt be a prominent factor in the future expansion of other industries of the State. In addition to its coal, the State has extensive beds of clay; the brick and clay product in 1902 amounted to \$500,000. The output of building stone was about the same. Montana leads the Union in the production of sapphires, the actual mining of which began in 1891. Four mining regions may be mentioned: A belt 12 miles north-east of Helena on the Missouri River; the Rock creek region, 30 miles west of Anaconda; the Cottonwood creek field, 10 miles east of Deer Lodge, and the Yogo mines in Fergus County, 13 miles west of Utica. The annual output of sapphires in the State in 1902 was between 450,000 and 500,000 karats, including those suitable for cutting and those used for mechanical purposes. A lapidary at Helena employed 15 men, and it is asserted that finer work was done there than on stones sent to London.

Manufactures.—The predominating industry is the smelting of ores. The largest smelter in the world, the Washoe, is located at Anaconda. For the treatment of ores, water is brought from a lake some 15 miles away in the mountains. The smelters of Butte have long been known. At Helena a large smelter is in operation, and another at Great Falls, where water power from the Missouri River is used. Many flouring mills have been established, utilizing almost the entire crop of wheat in the State, and consuming large quantities from the Dakotas. The large lumber mills at Bonner, Hamilton, Somers and other places have extensive factories in connection with the saw mills. They manufacture doors, sash, blinds, and other finishing stuffs. They also make large quantities of furniture from native lumber. A woolen mill, in operation in Big Timber, established in 1901, consumes a considerable amount of wool product. Although Montana leads all other States in the number of sheep, the loss from the two items of freight eastward and the difference in the value of the wool in the grease and the scoured product will annihilate the value of all the flocks on the range of the State in ten and a half years, if the wool is all shipped to the east. To treat it in the State will save \$1,000,000 annually to the State. Nearly every large town has a factory for malt liquors. Creameries and butter factories are springing up. The transcontinental railways have several repair shops and round houses in the State. A biscuit and cracker factory is located at Helena and does a large business. In 1900 1,000 establishments, representing a capital of \$40,945,846, were operating in manufactures and mechanical industries. The value of the product, \$57,075,824, involved an outlay of \$837,971 for salaries of officials, clerks, etc., \$7,969,886 for wages, \$1,668,487 for miscellaneous expenses, and \$32,702,650 for materials, freight and fuel. The value of manufactured products in 10 years, from 1890 to 1900, increased 10 fold, or more than 1,000 per cent, and more than 30 times the value in 1870.

Railroads.—The total mileage of railroads in 1902 was 3,131.87 miles, with 512.14 miles of side track. During that year and the year preceding 199.5 miles of road were constructed, not including large expenditures for betterment of track on existing road. Two transcontinental

MONTANA.

CAPITOL AND SENATE CHAMBER, AT HELENA.

MONTANA

lines cross the State. In the north is the Great Northern, with its many branch lines. Toward the southern part is the Northern Pacific, also with numerous short branches as feeders. The Burlington connects with the latter at Billings, running through trains over the Northern Pacific tracks to the coast. The Northern Pacific operates three daily passenger trains each way over most of the State—as far east as Billings, where one takes the Burlington route for Denver, Omaha and Saint Louis. The Great Northern operates two daily passenger trains each way over its road. The Oregon Short line connects at Butte, making a gateway to Salt Lake and the south, east and west. From one end of the State to the other on the Northern Pacific requires about 24 hours of travel, following for considerable distances the Missoula, Missouri, Gallatin and Yellowstone rivers, with their varied scenery. The Great Northern skirts the banks of the Kootenai, the Flathead, the Milk, and the Missouri rivers, and gives a view of the great unoccupied field along the two latter.

Finances.—The total assessed valuation of all property in the State in 1902 was \$183,395,690. The constitution of the State prohibits an indebtedness exceeding \$100,000. The tax rate was less than \$2.50 per \$1,000.

Politics.—Montana was admitted as a Republican State 8 Nov. 1889. It was organized as a territory in 1864. Owing to the silver question its politics have been very undecided. In 1896 the State was overwhelmingly for free silver. In 1900, the fusion of Democrats, Laborites and Socialists carried almost everything. In 1902, a Republican was elected to Congress.

State Government.—The constitutional convention met at Helena 4 July 1889, and concluded its labors 19 August. The constitution was approved by the people at a special election in October, and the proclamation making Montana a State was issued 8 November. Women are eligible to vote at all school elections, or to hold office or to be employed in any capacity in the State's educational system, except the office of State superintendent of public instruction. In 1902 women filled the office of county superintendent in 25 out of the 26 counties. They are frequently elected on school boards. The governor and State officers hold office four years, elected by a plurality vote. The governor is a member of the State board of prison commissioners, State board of examiners, State board of land commissioners, State board of equalization, State board of education, State board of commissioners for the insane, State board of commissioners for the deaf, dumb and blind, State board of horticulture, farmers' institute board, and State board of live stock commissioners. He appoints the State land agent, boiler inspector, mine inspector, medical and dental examiners, register of the land office, veterinary surgeon, trustees of the soldiers' home and State orphans' home, the State board of education, commissioner of agriculture, labor and industry, board of charities and reform, and board of pharmacy. The legislature has biennial sessions, the senate being composed of one member from each county, the house of representatives of such apportionment as is made by the legislature by law. There are now 26 in the Senate, 4 years, one half holding over, and 72 in the House, two years, making the total legislative

assembly 98. The State has one representative in Congress. There are three judges of the State supreme court, for a term of six years. There are twelve judicial districts, the judges elected for four years. The term of county commissioners is four years, each county having three members.

Banks.—The 'Bank Register' for 1900 shows a capital stock of all banks of \$4,347,870, undivided profits of \$2,391,500, and deposits of \$29,803,830.

Education.—Although young among the States, Montana ranks high in the efficiency of her educational system, the illiteracy of native born population being less than 4 per cent. Salaries of teachers are the highest of any State in the Union. More than 25 cents per day is spent upon each child in school, which is exceeded by two other States. There are school lands amounting to 2,341,000 acres, and land grants to State institutions aggregating 668,080 acres. There are about 1,200 teachers in the State, and 21 high schools are on the accredited list of the State University. The State has a system of county high schools, under a separate board of trustees and with separate administration from city schools. These schools are maintained by county assessment, and are free to pupils in the county. The law was passed in 1898, and has borne fruit beyond the expectations of the promoters of the law. More than half of the counties in the State have county high schools. For these schools, expensive and lasting buildings are constructed, which are being erected rapidly. This system gives to the counties in which the schools are located a number of specialists as teachers, which must result in great good to the educational system. The State Normal School, at Dillon, has about 100 in attendance, although organized but a few years. The land grant, 100,000 acres, is selected, yielding an annual income of over \$5,000, which is constantly increasing. The State Agricultural College and experiment station at Bozeman (1892) has about 350 students. The land grant is 140,000 acres. The State School of Mines (1899) is at Butte, with about 100 students; land grant 100,000 acres. The State University (1895), at Missoula, has about 350 students; land grant 46,080 acres. The University established a summer school for science at the upper end of Flathead Lake in 1899, known as the University of Montana Biological Station. It has continued in successful operation since, and has drawn many from the State and from eastern States. The Montana Wesleyan University (Methodist), at Helena, was originally of collegiate rank, but owing to financial difficulties it was reduced to the rank of an academy in 1901. The College of Montana (Presbyterian) was for years the only institution for higher education in the State. Financial difficulties caused its suspension about 1898. Many private schools are maintained by the Catholic Church. The Sacred Heart Academy at Missoula has an attendance of several hundred, as have also the academies in Butte and other places. A number of business colleges in the various parts of the State have good courses of study. The total amount issued in bonds for buildings for the various State institutions is \$835,000. The land grant for public institutions receives additional acreage with the extension of surveys.

MONTANA

Charitable and Penal Institutions.—The penitentiary is located at Deer Lodge. The contract system is in vogue, the contract for the care of convicts being made by the legislature. Of the inmates in 1902, but five were native born, the remainder of the convicts being from other States. Charities and reform are placed in the hands of a board of three members, appointed by the governor for four years. The reform school is located at Miles City. The school for deaf, dumb and blind is at Boulder, and is controlled by the State board of education. The Soldiers' Home is at Columbia Falls. The retreat for the Insane is at Warm Springs. In this, as in the penitentiary, the care of the inmates is by contract.

Government Reservations.—Notwithstanding the large area of the State a large part of it is set apart by Act of Congress as reserves. The forest reserves, with about 7,500,000 acres, are mentioned elsewhere. The Northern Pacific Railway Company received a grant from Congress approximating 15,000,000 acres. A part of this has been sold to settlers. There are several large Indian reservations in the State. The largest of these, the Crow reservation, occupies nearly half of Yellowstone County, while half of the reservation is in Custer County. It covers an area of 5,475 square miles, much larger than the State of Connecticut. Adjoining this on the east is the North Cheyenne reservation, with 765 square miles. In the northeastern part, with its southern boundary the Missouri River, is the Fort Peck reservation, comprising 2,775 square miles. In Choteau County the Fort Belknap reserve covers 840 square miles. The Blackfeet reserve covers about a third of Teton County. The only Indian reserve west of the divide in the State is the Flathead reservation, covering 2,240 square miles. The total land comprised by Indian reservations is about 7,500,000 acres, or equal to all the forest reserves. There are 300,000 acres in Military reservations. The State lands aggregate 3,000,000 acres. This leaves less than 60,000,000 acres as public lands, or held by settlers or mining claimants.

History.—The name Montana signifies mountains. The first explorations are believed to have been made by Verendrye, a French explorer, who, with his brother, two Canadians and a large war party of Sioux, ascended the Missouri River to the Gateway of the Mountains in 1745. They appear to have remained in Montana and Wyoming for about a year. The leaden plate bearing the arms of France, which they claimed to have buried beneath a monument, has not been discovered. It is supposed to be near the Great Falls of the Missouri. For 50 years the country remained unknown to history. The whole territory was ceded to Spain by France along with Louisiana in 1764. In 1800 the country again passed to France by treaty. In 1803 the Louisiana grant, embracing a large part of what is now Montana, was ceded by France to the United States for a consideration of \$15,000,000. The portion of the State west of the Rocky Mountains was embraced in the Territory of Oregon, when Oregon was organized in 1848. In 1863 a new Territory of Idaho was formed, including Montana. In 1864 the Territory of Montana was organized, with its boundary the same as that the State now has, except that about 2,000 square miles have been added in the southeast. In 1804

President Jefferson sent an expedition to explore the northwestern territory. The expedition was under the direction of two army captains, Lewis and Clarke, and has become famous in history as the Lewis and Clarke Expedition (q.v.). They ascended the Missouri, explored some of its tributaries, crossed the range to the Pacific Ocean, and returned in safety to Saint Louis. The first trading post was that of Manuel Lisa, built in 1807 near the mouth of the Big Horn, on the Yellowstone. In 1827 another was established on the Missouri at the mouth of the Milk River. In 1829 Alexander Mackenzie, for the American Fur Trader Company, built Fort Union on the Missouri above the mouth of the Yellowstone. In 1832 the steamboat Yellowstone ascended to this point. Previous to this all supplies were taken overland, a distance of nearly 2,000 miles. In 1835 a steamboat went 60 miles up the Yellowstone. In 1846 Fort Benton was built. Steamboats ascended the Missouri to the Fort in 1860, and the property was turned over to the United States in 1869. On the western side Father De Smet established St. Mary's Mission at Stevensville in 1845, still standing in 1904. Later he founded Saint Ignatius Mission in the valley at the foot of Flathead Lake and in the shadow of the beautiful Mission Mountains, which for 50 years was a great power for good among the Indians. From 1840 to about 1860 the history of Montana is occupied mainly with the missionary labors of Father De Smet and his associates among the Flathead Indians. About 1855 there were rumors of gold. In 1852 a half-breed named François Finlay, in Indian Benetsee, found gold in the sands of Gold Creek in Deer Lodge County. Rich discoveries were found in 1861. In 1862 Grasshopper and White's Bar were discovered, and Bannack in January 1863. Gold dust to the amount of \$25,000,000 was taken from Alder Gulch in a few months. Last Chance Gulch, where Helena now stands, produced many fortunes. The early mining was largely from placers, but the introduction of machinery made the treatment of ores of silver, gold, and copper very productive, and made the permanent prosperity of Butte. The introduction of so many settlers was not without a struggle. The Indians resisted the advance of the white men. Many minor conflicts occurred, but two are worthy of special mention. The war with the Sioux opened in 1876, and was a desperate conflict. General Custer was despatched against the Sioux, under the leadership of Sitting Bull, numbering 6,000 warriors. Pushing up the Rosebud to its headwaters Custer found the Indians encamped on the Little Big Horn. Custer was surrounded and his entire command massacred, not a man escaping. Within a year a series of victories under General Miles had destroyed the power of the Indians. In 1877 Chief Joseph, of the Nez Perces in the western part of Idaho, and his tribe prepared to cross the Bitter-Root Mountains against the orders of the government. They crossed the mountains and passed up the Bitter-Root, pursued by soldiers under the command of General Gibbons. At the Big Horn a bloody and indecisive battle was fought. Chief Joseph passed through, up the Madison, through the National Park, across the prairie to Snake Creek, and was captured only a few miles from the Bear Paw Mountains,—a trail of over 1,500 miles, more than half of which was a running

MONTANA

battle. A convention met in Helena in January 1884, which adopted a State constitution. This was approved by the people in November of the same year. Congress refused to sanction the request for statehood, and this was not granted until 1889. During the past ten years immigration has brought many citizens from other States. The former restless population has changed into people who are desirous of making permanent homes. Agriculture and fruit culture, through irrigation, has added a new industry to the State, and the people of the farm join hands with the toiler beneath the surface in the mines in an exchange of products, to the advantage of both and for the advancement of the State.

Population.—The first territorial census in 1860 shows but 288 people in the Territory, exclusive of Indians. The population as given by the census for each decade is as follows: (1860) 288; (1870) 20,595; (1880) 39,159; (1890) 132,159; (1900) 243,329. The population at the last census (1900) includes 11,343 Indians, 1,523 negroes, 1,739 Chinese, and 2,441 Japanese. The total population of school age was 65,871. The aggregate for the State militia was 83,574. But 5.8 per cent of the population was considered illiterate, the native born having but 3.9 per cent as against 8.3 per cent foreign born. A careful estimate based on the school census and the list of registered voters, makes the population for 1902 not less than 265,000.

There are 26 counties in the State, as follows, with their county-seats:

Beaverhead, Dillon.	Madison, Virginia City.
Broadwater, Townsend.	Meagher, White Sulphur
Carbon, Red Lodge.	Springs.
Cascade, Great Falls.	Missoula, Missoula.
Choteau, Fort Benton.	Park, Livingston.
Custer, Miles City.	Powell, Deer Lodge.
Dawson, Glendive.	Ravalli, Hamilton.
Deer Lodge, Anaconda.	Rosebud, Forsyth.
Fergus, Lewistown.	Silver Bow, Butte.
Flathead, Kalispell.	Sweet Grass, Big Timber.
Gallatin, Bozeman.	Teton, Choteau.
Granite, Phillipsburg.	Valley, Glasgow.
Jefferson, Boulder.	Yellowstone, Billings.
Lewis and Clarke, Helena.	

The cities in the order as given by the census of 1900, are as follows: Butte, Great Falls, Helena, Anaconda, Missoula. Butte is easily ahead of all other cities in population and business. Its great mines and smelters, working day and night, create a never ceasing movement of the inhabitants. The city is located on the Pacific side of the main range, at an altitude of about 5,700 feet, a few miles from the summit of the range. Great Falls is in the prairie region, on the Missouri River, near the head-waters of the rapids and falls. The census population of 15,000 has been greatly increased since it was taken. The city has many boulevard streets and takes on a metropolitan appearance. Helena, the capital, has an altitude of 4,710 feet. Its climate is remarkably good. The capitol, erected in 1900-2, at a cost of over half a million, is a beautiful structure, comparing favorably with similar buildings in other States costing much more for erection. Anaconda was founded by Marcus Daly as a suitable place for the erection of smelter works. Missoula, the Garden City, at the outlet of Hell Gate cañon to the Bitter-Root and Missoula valleys, commands the trade of the greater portion of the State west of the range. Hamilton, in the Bitter-Root Valley, has a beautiful and picturesque location. Near

the town is the Daly ranch, reclaimed from the arid bench land of the valley, which was made self-supporting in a short time, and which has become famous for its stables of fleet horses. Bozeman, the beautiful city, is in the Gallatin Valley, on the historic ground discovered by the Lewis and Clarke expedition. Kalispell is in the rich valley at the head of the Flathead Lake, and in a few years grew into a good town. Miles City and Billings, in the east, both on the Yellowstone River, are centres of the great live stock region, and handle the trade of a large area of country. Small towns of the State do a surprisingly large business, commanding as they do all the trade for many miles.

Bibliography.—The following works may be consulted for further information relative to the history and development of the State: Bancroft, 'History of the Northwest Coast' (1886); 'Idaho and Montana' (1890); Biddle, 'History of the Expedition under the Command of Lewis and Clarke' (1842); Davies, 'Civics of Montana' (1896); Lewis and Clarke, 'Travels from St. Louis by Way of Missouri and Columbia Rivers to the Pacific Ocean' (1804-6); Palladino, 'Indians and Whites in the Northwest; or, a History of Catholicity in Montana' (1895); Roosevelt, 'Ranch Life and the Hunting Trail' (1888); 'Geological Survey of the Territory'; 'Preliminary Report of Montana and portions of Adjacent Territories' (1871); 'Wonderland,' issued annually by N. P. Railway, St. Paul; 'Rocky Mountain Magazine.' Publications from the agricultural experiment station at Bozeman, from the University at Missoula, and by the various State officers. Annual report, Bureau of Agriculture, Labor and Industry, Helena.

MORTON J. ELROD,
University of Montana.

Montana College of Agriculture and Mechanic Arts, founded in 1893, at Bozeman, Mont. The four years' undergraduate courses include general science, agriculture, biology, analytical and applied chemistry, domestic science, mechanical engineering, electrical engineering, and civil engineering; there are also short courses in business (one year), domestic science (one year), and agriculture (13 weeks). The degrees conferred for the regular undergraduate work are bachelor of science, bachelor of mechanical engineering, bachelor of electrical engineering and bachelor of civil engineering. Graduate courses are offered, and special courses in music and art; and a preparatory department is maintained. The State experiment station is also connected with the college. The college receives the benefit of the Federal land grants of 1862 and 1890, and also State and Federal appropriations; the income in 1902 amounted to over \$57,000. The students in 1902 numbered 279, of whom 112 were women.

Montana, University of, the State university opened in 1895, at Missoula, Mont. It was endowed by a grant of land from Congress in 1802. Courses are offered in the classics, philosophy, general science, and applied science; there is also provision for graduate work in these courses; a preparatory department is maintained, and there is a summer school of science. The degrees conferred are A.B. and B.S., and the corresponding masters' degrees. Women are admitted to the university, and constitute about

MONTANISM — MONTCALM

one half the student body. The income is derived mainly from the proceeds of the sale or rental of the land given by Congress; State appropriations are also made; in 1903 the income amounted to \$37,565. The campus contains 40 acres, and the buildings were valued at \$140,000 in 1902; the number of volumes in the library was 7,500. In 1903 the students in all departments numbered 300, the faculty 14.

Montanism, mon'-, the religious system of Montanus (q.v.), an inhabitant of a Phrygian village called Pepuza, who, about 171 A.D., proclaimed himself the Paraclete or Comforter promised by Jesus, and he was professed to utter prophecies. Among others he was supported by two ladies, Prisca, or Priscilla, and Maximilla, who also claimed the gift of prophecy. He multiplied fasts, forbade second marriages, did not permit churches to give absolution to those who had fallen into great sin, forbade all female ornaments, required virgins to be veiled, and would not sanction flight in persecution. He was ultimately expelled from the Church. Tertullian, in the year 204, joined the Montanists, but did not forfeit the respect of the Church catholic, as the Montanists held the fundamental doctrine of Christianity, and differed from others more in their rigid practice than in their faith. Jerome wrote against the Montanists, who continued till about the 6th century.

Montanite, a mineral consisting of the hydrated oxides of bismuth and tellurium, and having the formula $\text{Bi}_2\text{O}_3 \cdot \text{TeO}_2 \cdot 2\text{H}_2\text{O}$. It occurs as an incrustation, frequently in connection with the mineral teradymite, from which it is often formed by alteration. It is soft and opaque with a waxy lustre, and is variable in color. Montanite is found at Highland, Mont., and also in Davidson County, N. C., and at Norongo, N. S. W.

Montanus, mōn-tā'nūs, Phrygian sectary of the middle of the 2d century A.D. Of him practically nothing is known save in connection with his sect, the Montanists. He was a heathen priest, a native of Ardahan; was converted to Christianity about 156; and soon gathered around him a group of followers who believed with him that he was the mouthpiece of the Holy Spirit, as were his companions Prisca, or Priscilla, and Maximilla, each of whom had left her husband to join Montanus. Both these women uttered prophecies, but like Montanus claimed to be only the passive agents of the Holy Ghost. Montanus' principal tenets, apart from his belief that every believer may be the means of special revelation, were largely millenarian; in view of the approaching end of the world he enjoined asceticism, strict church discipline with the exclusion of all offending members, the terrible effect of mortal sin and the incompetency of the Church to forgive it. He and his followers counted it sin to attempt escape from persecution. He was excommunicated with his followers about 175, and died soon after; Maximilla, the last of the prophets, died in 179. His teaching spread after his death, his most notable disciple being Tertullian (q.v.). The sect soon died out in the West, but survived in the East until the time of Justinian, when it was suppressed. Consult Bonwetsch, 'Geschichte des Montanismus' (1881).

Montargis, mōn-tār-zhè, France, a town in the department of Loiret, 47 miles east by north of Orleans. Here in 1371 is said to have occurred the famous judicial combat between the "dog of Montargis" and Macaire, its master's murderer. The dog not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and when Charles VI. granted the ordeal of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body.

Montauban, mōn-tō-lōn, France, capital of the department of Tarn and Garonne, on the Tarn, 342 miles south by west of Paris. It is situated on a plateau surrounded by the Tarn, the Tescou, and a deep ravine. The cathedral, episcopal palace, hôtel de ville, and the bridge over the Tarn are its principal features. Montauban has manufactures of silk bolting cloths, of common cloths, colors, porcelain, starch, candles, etc.; silk and wool spinning-mills, dye-works, potteries, etc. During the religious wars in France, Montauban was a stronghold of the Huguenots, and was besieged in 1580 by Montluc, and in 1621 by the troops of Louis XIII., without success; but it was taken in 1629 by Richelieu, and its walls razed to the ground. The Protestants still maintain both an academy and a theological college. Pop. (1901) 30,506.

Montauk (mōn-tāk') **Indians**, an American tribe of the Algonquin family formerly occupying the extreme eastern end of Long Island, N. Y. They were formerly a powerful people, but a pestilence in the 17th century reduced their number to less than 1,000. In 1903 only about a dozen of the Montauk tribe survived.

Montauk Point, N. Y., the eastern peninsular promontory of Long Island, in Suffolk County, with lighthouse and life-saving stations, the lighthouse, in lon. $41^\circ 4' \text{ N.}$; lat. $71^\circ 51' \text{ W.}$, being built of stone, 170 feet high, and its light visible 19 miles. The peninsula has a height of from 50 to 100 feet above the sea, is rolling and wooded, and noted for its bracing, healthful climate. Here in 1898 Camp Wikoff was established for the sick, wounded, and convalescent soldiers who had served in the Santiago campaign.

Montcalm, mōnt-kām' (Fr. mōn-kālm), **Louis Joseph de Saint Véran**, loo-è zhō-zèf dè sǎn vā-rǎn, MARQUIS DE, French soldier: b. near Nîmes 1712; d. Quebec, Canada, 14 Sept. 1759. He entered the army at 14, distinguished himself in the war for the Austrian Succession, and gained the rank of colonel in the battle of Piacenza, Italy, in 1746. In 1756, being then a brigadier-general, he was appointed to command the French troops in Canada, where he began operations against the English with great activity and success. Fort Ontario at Oswego was carried on 14 Aug. 1756, after a well conducted attack. The next year he took Fort William Henry, at the head of Lake George, which was held by a garrison of over 2,500 men, and thus became possessed of 42 guns and large stores of ammunition and provisions. In the campaign of 1758 he occupied the strong position of Fort Carillon (Ticonderoga), made it still stronger by intrenchments, and on 8 July held it with 3,600 men against a British force of over 15,000. His personal bravery had gained him great popularity among his soldiers, but the

MONTCLAIR—MONTEFIORE

want of energy on the part of the home government, the scarcity of food all over New France, and personal dissensions between himself and the civil governor forbade him to look for much assistance; and he expressed his conviction that in a few months the English would be masters of the French colonies in America; yet he prepared as best he could for the campaign of 1759. The English had sent strong reinforcements and were preparing for an attack on Quebec. As the success of the whole campaign and indeed the conquest of Canada depended upon the taking of that city, Montcalm had concentrated his principal forces on the banks of the Montmorency River to protect it. In the first attack, 31 July, the English general, Wolfe, was repulsed; he later succeeded in landing his troops above Quebec, and on 13 September brought his whole force to the Heights of Abraham; Montcalm at once opposed his advance, but though he led the attack in person, his troops soon broke before the fire of the British. Wolfe fell in the moment of triumph; Montcalm was mortally wounded, and died the next morning. Consult: Parkman, 'Wolfe and Montcalm' (1885); Bonnechose, 'Montcalm et la Canada Française' (1877); Falcairrolle, 'Montcalm devant la Pos-térité' (1886).

Montclair, mönt-klär', N. J., a town in Essex County, six miles northwest of Newark, on the New York & G. L., and the Lackawanna R.R.'s. The upper portion was originally called Speertown when settled by Hollanders from Hackensack, and the lower portion was first called Cranetown, then West Bloomfield, by its English settlers from Newark. It was at first included in Newark, and afterward in Bloomfield. It received its present name in 1865 and received its charter of incorporation in 1868. Montclair is situated on the first range of the Orange Mountains, at an average altitude of 300 feet, its highest point at 650 feet embracing an extensive view. It is noted for its healthful climate, and is principally a residential place, the home of many New York business men. It has a hospital, military academy, two orphan asylums, high school, public library, State and savings banks. Its industrial establishments include electric construction works, printing establishment, etc. Pop. (1900) 13,962.

Monte Carlo, mön'të kär'lö, Monaco, a town of the principality about one mile northeast of the capital, celebrated for its Casino, the most luxuriously appointed gambling establishment in the world, founded in 1858. Monte Carlo is also noted for its scenic surroundings, its mild and healthful climate, and its attractive appointments of perfect roads, magnificent gardens, handsome promenades, and elegant residences. Its situation on an isolated elevation overlooking a bay of the Mediterranean is particularly beautiful. The 'Association of the Watering-Place and Strangers Club of Monaco,' with a capital of \$6,000,000 in 60,000 shares, holds the contract, which was made with the late M. François Blanc and expires in 1913, whereby the reigning prince is paid annually the sum of \$350,000 for the concession to play. The society practically bears also the cost of the temporal and spiritual government of the principality, its annual expenditure alone amounting to over \$4,000,000. Roulette and trente-et-quarante (qq.v.) are the

principal games played. Pop. (1901) 3,794. See **MONACO**.

Monte-Casino. See **CASINO**, **MONTE**.

Monte Cristo, mön'të krës'to, or kris'tö, a small island in the Mediterranean belonging to the Italian province of Leghorn, 28 miles south of Elba. In the 16th century it was ravaged by pirates, and as it is rocky and barren, rising 2,000 feet above the sea, it long remained uninhabited. Since 1874 there is a penal agricultural colony here. The elder Dumas has given the name of this isle as title of the hero of one of his most popular romances, 'The Count of Monte Cristo.'

Monte Rosa, rö'sä, on the Italian-Switzerland boundary, is an Alpine mountain mass of the Pennine ridge, with numerous peaks, eight of which are over 13,000 feet high. Dufour Spitze, the principal peak, is second to Mont Blanc as the highest peak of the Alps, reaching an altitude of 15,217 feet, 564 feet less than its rival, 50 miles to the southwest. Monte Rosa is covered on all sides with glaciers, chief of which is the Gorner Glacier on the west, 6½ miles long. The peak was first ascended—a most difficult feat—in 1855. Copper and iron mines are worked in the mountain.

Montecuculi, mön-të-koo'koo-lë, or **Montecucoli**, **Raimondo**, Austrian military commander: b. near Modena 21 Feb. 1609; d. Linz 16 Oct. 1680. He entered the Austrian service, and served during the Thirty Years' war with great distinction. After the Peace of Westphalia (1648) he visited Sweden and England in a diplomatic capacity; and in 1657 the emperor sent him to the aid of the king of Poland against Rakoczy and the Swedes, and next year he assisted the Danes against the latter. In 1664 he gained a great victory over the Turks after having driven them out of Transylvania. In 1673 he was placed at the head of the imperial troops, and checked the progress of Louis XIV. by the capture of Bonn, and by forming a junction with the Prince of Orange in spite of Turanne and Condé. Montecuculi's subsequent advance into Alsace was repulsed by the Prince of Condé. His last military exploit was the siege of Philippsburg. The emperor Leopold made him a prince of the empire and the king of Naples gave him the Duchy of Melfi. His memoir on the Turkish War, written in Italian (1703), was translated into several languages. Consult: Campori, 'Raimondo Montecuculi, la sua famiglia e i suoi tempi' (1877); Grossmann, 'Raimund Montecuculi' (1878).

Montefiore, mön-të-fë-ö'rë, **Claude G.**, English author and Jewish communal worker: b. London 1858. He studied at Balliol College, Oxford; identified himself with Hebrew charities and educational movements in London; was president of the Jewish Historical Society (1899-1900); and is head of the Anglo-Jewish Association, the Jews' Infant Schools, etc. With Israel Abrahams he edited 'The Jewish Quarterly Review' and wrote a series of sermons, 'Aspects of Judaism' (1895). He has published besides the Hibbert Lectures for 1892, 'The Origin of Religion, Illustrated by the Ancient Hebrews'; and 'Liberal Judaism' (1903).

Montefiore, **Sir Moses**, Jewish philanthropist: b. Leghorn, Italy, 24 Oct. 1784; d. Rams-

MONTENEGRO

gate, England, 28 July 1885. He was descended from a family of wealthy Anglo-Italian bankers; was educated in London; became a leading member of the Stock Exchange; and retired from active business in 1824. From that time he devoted himself to the service of his race, working for the removal of disabilities and oppression under which the Jews in England and elsewhere had suffered great hardship. His wife, whom he married in 1812, was Judith Cohen, a relative of the Rothschilds, and in her Montefiore found a companion who entered ardently into his philanthropic undertakings. He was for a time high sheriff of Kent, and after long exclusion and repeated re-election was legally recognized as sheriff of London in 1837. In that year he was knighted, and in 1846 raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy for his race in various countries, chiefly in Poland, Russia, Rumania, and Damascus. He made seven journeys to the East, the first in 1827, and the last in 1874, mainly for the amelioration of the condition of the Jews. At Bucharest, during an anti-Jewish tumult, he boldly faced the mob at the risk of his life. At Ramsgate, in 1865, he endowed a Jewish college in memory of his wife, who died three years before. In his 100th year he was a type of hale and venerable manhood.

Montenegro, mŏn-tě-nă'grō (native, *Tser-nagora*; Turkish, *Karadagh*, Black Mountain), an independent European principality in the northwest of Turkey, bounded north by Bosnia and Herzegovina, east by Bosnia, south by Albania, and west by the Adriatic Sea and a strip of Dalmatia. Its area was increased by the treaty of Berlin of July 1878, from about 1,710 to about 3,630 square miles. The country is a succession of elevated ridges, diversified here and there by a lofty mountain peak, some of them attaining elevations of 5,000 or 6,000 feet, or even 8,000 feet on the borders of the country, with a few beautiful and verdant plains and valleys, in which the soil is tolerably fertile; chief of these are the department of Tzernitza and the valley of Bielopavlich, watered by several streams, the principal of which is the Moratsa, which falls into the Lake of Scutari. The climate is healthful. Forests of oaks and holly, ash, beech, firs, walnuts, hazel, wild pears, poplars, willows, alders, and the sumach, used for dyeing and tanning, cover many of the mountain sides. The cultivated productions are Indian-corn, potatoes, cabbage, cauliflower, and tobacco, with several kinds of fruit-trees, including the peach, olive, pomegranate, mulberry, and others. In the department of Tzernitza, already mentioned, apples, vines, carobs, almonds, figs, quinces, walnuts, etc., also grow in abundance. Agriculture is in a rude state, though every cultivable piece of land, even if only a few feet square, is planted with Indian-corn, potatoes, or some other useful plant. Sheep, goats, and pigs are reared in great numbers; the two former affording a profitable supply of wool and cheese for exportation. Game is not abundant, but fish are taken in great quantities, and are of excellent quality, particularly the trout, which are celebrated, and some of them of immense size; and a kind of carp is caught in large quantities, and dried and salted for export to Vienna and Trieste. Manufactures, with excep-

tion of a coarse woolen stuff, are unknown. The chief occupations of the inhabitants are agriculture and fishing; the latter carried on principally in the Lake of Scutari, which lies partly in Albania. The exports of Montenegro are smoked mutton-hams, salted fish, wax, honey, hides, tallow, cheese, butter, cattle, and other agricultural produce. The chief imports are cattle, tobacco, salt, wine, brandy, coffee, sugar, and manufactured goods. The Montenegrins belong to the Serbian branch of the Slavonic family of peoples. They are generally of tall stature, and well proportioned, with singularly powerful voices, which enables them to carry on conversations at incredible distances; foreheads good, face rather square, moderately aquiline or straight nose, and animated eyes. Both men and women are robust: the latter are often beautiful when young but soon lose their good looks by laborious and unfeminine occupations. The people generally are cheerful in manner, extremely brave, and hospitable and courteous to all except the Turks, whom they hate. The men go at all times fully armed. The houses are of stone, generally with thatched roofs; but many are covered partly or entirely with wooden shingles. There are no towns in Montenegro, but there are some 300 villages, of which the chief are Cettigne (q.v.), the capital; Podgoritzza (pop. 6,534); and the seaports Dulcigno and Antivari. The language of the Montenegrins is a Slavonic dialect. In religion they are all of the Greek Church. Education, which was formerly much neglected, is now becoming freely diffused, the public schools having increased from one in 1851 to about 70 in 1890. Montenegro, until 1851, was a theocracy, governed by a Vladika or prince, who was at once a bishop, a judge, a legislator, and a commander-in-chief. The office was hereditary in the family of Petrovitch from 1697. But as the Vladika could not marry, the dignity was inherited through brothers and nephews. In 1851 the civil and ecclesiastical offices were disjoined, the Vladika confining himself to the latter, while the former devolved on the Hospodar. The revenue of the principality was estimated for 1901 at about \$400,000. Montenegro has no coinage of its own. Pop. about 228,000.

Montenegro formed a part of ancient Illyria, and in the Middle Ages belonged to the great Servian kingdom. The origin of the sacerdotal power dates from 1516, when the secular prince, having no children, withdrew to Venice, and transferred the government to the archbishop Germanos. In the reign of Peter the Great the Montenegrins placed themselves under the protection of Russia, both sharing in a common enmity against the Turks. In 1796 the Prince-bishop, Pietro I., inflicted such a loss on the Pasha of Scutari, who had invaded Montenegro, that for many years they left it unmolested. Pietro II. (1830-51) made strenuous efforts to improve the condition of his people by liberalizing the constitution, and attempting to reclaim his subjects from their vindictive and predatory habits. His successor, Danilo I., having separated the civil and ecclesiastical offices, Russia withdrew her subsidy of 8,000 ducats, but subsequently resumed payment of it, not, however, before great internal commotion had arisen from the necessary imposition of taxes to meet the deficit so caused. The Turks, led by Omar

Mofer Montefiore, D.

MONTEPIN — MONTESANO

Pasha, again invaded the country, but a treaty was arranged 15 Feb. 1853. Danilo was assassinated in 1860, and was succeeded by the present prince Nicholas I. In 1861 the Montenegrins excited a rebellion against the Turkish sway in the Herzegovina, the result of which was the infliction of such a chastisement on them that they were compelled (1862) to accept a disadvantageous peace, in which it agreed to the occupation of several points on the road from Herzegovina to Scutari by Turkish troops. In 1870, however, the principality managed to get these troops withdrawn. In 1876 Montenegro joined Serbia in a war against Turkey, and on the conclusion of the Russo-Turkish war of 1877-8, it received, as already mentioned, an accession of territory by the treaty of Berlin. In 1896 Victor Emmanuel III., the present king of Italy, married Helena, third daughter of Prince Nicholas.

Montepin, Xavier Aymon de, ksäv-ê-â â-môn dê môn-tâ-pân, French novelist and playwright; b. Apremont, Haute-Saone, France, 18 March 1824; d. Passay, near Paris, 1 May 1902. He founded the journal 'Le Canard' in 1848 but soon deserted journalism for fiction. His works abound in sensational incidents and situations. He wrote nearly 100 novels, which have been translated into many languages, the first being 'The Knights of Lansquenet' (1847); and, alone or with collaborators, about 30 plays. He made no pretensions to literary style and wrote for the uncritical and easily pleased populace. For a long period every issue of *Le Petit Journal* contained an installment of some story by Montepin appearing as a *feuilleton*.

Monterey, môn-tê-râ', Cal., city in Monterey County; on Monterey Bay, and on the Southern Pacific railroad; about 100 miles south by east of San Francisco. The first settlements were made by the Spaniards, and in 1770 they founded here the mission of Saint Charles Borromeo of Monterey. It was the capital of the province from 1840 to 1845. Commodore Jones of the United States Navy captured the place in 1842, and held it for one day, under the erroneous impression that war had been declared against Mexico. Commodore Sloat raised here the United States flag 7 July 1846; war had been declared between the United States and Mexico 22 April 1846. Monterey was the capital of the military government of California in 1847. In 1849 the State Constitutional Convention was held here, and in 1850 the place was incorporated.

The section in which the city is located consists of farm lands upon which are raised grains and fruits. Fishing and stock-raising are prominent industries. It is a favorite resort for summer and winter, as the climate is equable, the scenery beautiful, and there are good facilities for bathing and fishing. Ruins of the old Spanish Mission are still to be seen. Some of the noted buildings are Colton Hall, in which the first State Constitutional Convention met, the old custom-house, and the San Carlos Mission. The city is the seat of San Carlos Academy, and it has good public and parish schools and a public library. Pop. (1890) 1,662; (1900) 1,748.

Monterey, môn-tâ-râ', Mexico, the capital of New Leon, on the San Juan, a tributary of the Rio Grande del Norte, at the head of a large

and beautiful valley, 85 miles east by north of Saltillo, lat. 26° N.; lon. 100° W. It stands on a plateau 1,626 feet above the level of the sea, and has well-paved streets, houses of stone in the Moorish style, with flat roofs, and is the most important place in northern Mexico. Near it are gold, silver, and lead mines. As a railway centre it commands a large trade. In 1846 it was besieged by the American forces under General Taylor in the war between the United States and Mexico and compelled to capitulate. See MONTEREY, BATTLE OF. Pop. (1900) 72,250.

Monterey, Battle of, in American history; in the early part of the war between the United States and Mexico, Monterey, which occupies a strong natural position and was well fortified by art, was held by the Mexican General Ampudia, with about 10,000 regular troops. In August 1846, Gen. Taylor (q.v.) with a force of 6,625 men, mostly volunteers, marched from Matamoras to attack Monterey; and on 9 September he encamped within 3 miles of the place. Ten days were spent in reconnoitring, and on the afternoon of 19 September, Gen. Worth was ordered to march with his division around the hill occupied by the bishop's palace, to take a position on the Saltillo road, and to carry the enemy's detached works in that quarter, while the main body of the army were to make a diversion against the centre and left of the town by batteries erected during the night. In the morning these batteries opened upon the city, which replied by a heavy fire from the citadel and other works. The lower part of the city was assaulted and entered by the Americans, and a Mexican work of great strength captured after hard fighting by a brigade under Gen. Quitman. Gen. Butler also entered the town at another point with the First Ohio regiment. Meanwhile Gen. Worth carried the heights south of the river and the Saltillo road, and turned the guns of the Mexican works in that quarter upon the bishop's palace. The Mexicans evacuated the lower part of the city during the night, and early next morning Gen. Worth stormed the height overlooking the bishop's palace; and by noon that stronghold itself was taken by the Americans, and its guns turned upon its flying defenders. The houses of the city being solidly built and capable of defense, and the streets strongly barricaded, the Americans were forced to take each house in succession by breaking through the walls till they reached the principal plaza. The conflict lasted till the 23d, the Mexicans contesting desperately every foot of ground till nothing remained in their possession but the citadel. On the morning of the 24th Gen. Ampudia capitulated, and was allowed with his army to march out with the honors of war. The loss of the Americans in these operations at Monterey was 120 killed and 368 wounded. That of the Mexicans was not ascertained, but was probably much greater. See MEXICAN WAR.

Montesano, môn-te-sá'nô, Wash., town, county-seat of Chehalis County; on the Chehalis River, at the head of tide-water navigation, and on the Northern Pacific Railroad; about 45 miles west by south of Olympia. It is in a region in which the chief occupations are farming, lumbering, and fishing. It manufactures considerable lumber and lumber products, and has creameries. The salmon fisheries are quite important. Three miles above the town

MONTESINOS — MONTEVIDEO

on the Chehalis River is a salmon hatchery. Pop. (1890) 1,632; (1900) 1,194.

Montesinos, mōn-tā-sē'nōs, **Fernando**, Spanish historian: b. Osuna, Spain, 1593; d. Seville, Spain, 1655. He went to Lima, Peru, in 1610 and served under the government afterward becoming visitor of the audiencia of Charcas, and councillor of the viceroy. By his considerate treatment of the Indians he won their friendship and their caciques placed at his disposal valuable information concerning their history. He ranks at the head of the Peruvian archæologists, and he published several able works on metallurgy. Among his books are: 'Ophyr de España, ó anales de los reynōs de Quito y Lima' (1640); 'Memorias históricas del antiguo reyno de Quito' (1652); etc. See Prescott's 'History of Peru,' Vols. I. and II.

Montespan, François Athenais, frān-swāz āth-ē-nā mōn-tēs-pān, MARQUISE DE, mistress of Louis XIV. of France: b. 1641; d. Bourbon-l'Archambault, 27 May 1707. She was the 2d daughter of the Duke of Mortemart, and was, in 1663, married to the Marquis de Montespan. To great beauty she added a natural liveliness and wit, and a highly cultivated mind. Soon after her appearance at court she attracted the king's attention, and from 1668 till 1674 shared his favor with Mlle. de la Vallière, but supplanting her in 1674; M. de Montespan after a detention in the Bastille had already been ordered to retire to his estate. Mme. de Montespan bore eight children to the king, four of whom died in infancy. The others were entrusted to the care of Mme. Scarron, afterward De Maintenon. The influence of Mme. de Montespan was often exercised in public affairs, and her sway over the king continued until about 1679, when a growing attachment to Mme. de Maintenon finally estranged his affections from Mme. de Montespan. She rarely appeared at court after 1685, and in 1691 entirely quitted it. Her last years were devoted to religious exercises, acts of benevolence, and penitence.

Montesquieu, mōn-tēs-kū' (Fr. mōn-tēs-kē-ē), **Charles Louis de Secondat**, shār'l loo-ē dé sē-kōn-dā, **BARON DE LA BRÈDE ET DE**, French author: b. near Bordeaux 18 Jan. 1689; d. Paris 10 Feb. 1755. He was educated at the Oratorian College of Juilly (near Meaux) and at Bordeaux; studied law; in 1714 became a counsellor of the parliament of Bordeaux; and in 1716 parliamentary president. He was an active participant in the proceedings of the Bordeaux Academy, writing papers on natural science, politics, and philosophy. The 'Lettres Persanes,' the first of the three great works on which his fame principally rests, appeared in 1721. Purporting to consist of the correspondence to and by two Persians traveling in France, this book is a lively satire upon the manners and customs, and the political and ecclesiastical institutions of the author's age and country. It is said to have passed through four authorized and other unauthorized editions within the year of publication. Montesquieu sold his president's office in 1726, and then visited Germany, Hungary, Italy, Holland, and England. In England he stayed for 18 months, imbibed a lasting admiration for its social and political institutions, and was elected to the Royal Society. He returned to France in 1731, and in 1734 published

'*Considérations sur les Causes de la Grandeur et la Décadence des Romains*,' one of the first important studies in the philosophy of history. It has been called Montesquieu's best in point of style, and when its brevity is considered (200 pp. in Laboulaye's collected edition), is remarkable as well for the original and weighty quality of its thought. In 1748 'L'Esprit des Loix,' the result of 20 years of labor, was published, and at once placed its author among the greatest writers of his country. The scope of the work is perhaps best indicated by the sub-title of the original edition, which describes it as a treatise on the relation which ought to exist between the laws and the constitution, manners, climate, religion, commerce, etc., of each country. It passed through no less than 22 editions in a year and a half, and won grudging praise even from Voltaire, who was fond of sneering at Montesquieu's reputation. Notwithstanding inaccuracies, digressions, and defective arrangement, it is throughout notable for its impressive assemblage of facts, its constructive ability, its wisdom, and its frequently epigrammatic style. It was the first work to establish a basis for legal principles, and it supplied the method of procedure in later historical studies in political science. Montesquieu was received a member of the Académie in January 1728. There is an edition of his works by E. Laboulaye (1875-9). Consult also the biographies by Vian (2d ed. 1879) and Sorel (1887).

Montesquieu-Fézensac, mōn-tēs-kē-oo-fā-zān-sāk, **Robert**, COUNT DE, French poet: b. Paris 9 March 1855. He was well known as an art collector and as an amateur goldsmith and enameler in 1892, when he published 'Les Chauves-souris,' a volume of verse symbolizing the mystery of night. It was followed by 'Chef des Odeurs suaves' (1893), of which the theme was flowers and perfumes, 'Les Hortensias Bleus' (1896) and 'Perles Rouges' (1899), the latter a series of sonnets reviving Versailles at its glory; by 'Les Paons' (1901), on precious stones and their mystic meanings; and by two volumes of essays, 'Roseaux pensants' (1897) and 'Autels privilégiés' (1899), both attempting to appreciate some wronged artist. He appeared in New York in the winter of 1902-3 as a lecturer and reader. His style is hyper-aesthetic, with much weird beauty, and his themes strangely far-fetched.

Montevideo, Minn., village, county-seat of Chippewa County; at the junction of the Minnesota and the Chippewa rivers, and on the Chicago, Milwaukee and Saint Paul railroad; about 125 miles west of Saint Paul. It is in a fertile agricultural region where wheat is one of the important products. The chief industrial establishments are flour-mills, grain elevators, a creamery, cheese factories, and a cooperage. It is the seat of Windom Institute (Congregational) and it has a high school, a public library, and a town-hall. Near the village is a monument erected in memory of the surrender of Little Crow, the Sioux chief, in 1862. Pop. (1890) 1,437; (1900) 2,146.

Montevideo, mōn-tē-vid'e-ō (Sp. mōn-tā-vē-dā-ō), Uruguay, capital of the department of the same name; also capital and emporium of the republic; situated on the

MONTEVIDEO — MONTEZUMA

northern coast of the Rio de la Plata (see LA PLATA, RIO DE). Founded in 1726, its inhabitants numbered only 3,500 in 1818, and 9,000 in 1829; indeed, it was scarcely more than a fortress until 1834, and at various times the governments of Argentina, England, and Brazil attempted to gain possession of this stronghold, commanding the entrance to the great waterway of the South. The demolition of the walls, the opening of new streets, and (in 1836) the beginning of foreign immigration, transformed the place. In the years from 1838 to 1841, about 28,000 European immigrants entered the port. There were 45,000 inhabitants in 1860; 105,000 in 1872; 238,080 in 1892; and at the beginning of 1902 about 278,186 in the territory of 256 square miles embraced in the department. Immigrants arriving in 1901 were: Italian, 3,777; Spanish, 2,708; Brazilian, 715; French, 512; German, 336; and English, 209. The harbor is the best on the Rio de la Plata; nevertheless it is far from being altogether satisfactory. An elaborate system of moles and docks was projected more than 10 years ago, and the work of harbor improvement actually began in July 1901. The water at the harbor's entrance being but 15 to 17 feet deep, vessels of great draught have formerly anchored in the outer roadstead, and discharged their cargoes on lighters. The city is built on a chain of hills of moderate elevation, with a gradual slope toward the shore; the conditions are therefore favorable for efficient drainage. An active commerce is maintained with foreign countries and towns of the interior. As it is the only port of entry, it furnishes nearly all of the revenue of the government, receiving or forwarding about 90 per cent of the importations of the entire country and about 67 per cent of the total exportations. In 1901 imports valued at \$21,230,803, and exports valued at \$18,849,177 passed through Montevideo. For 1899 the figures were: imports \$21,876,987, and exports \$23,340,239. Conspicuous buildings are the Parliament House, Government Palace, National Bank, Solis and San Felipe theatres, Uruguay Club, and School of Arts and Sciences. There are commercial houses of every class, street railways, telegraph and telephone service, electric light works, printing establishments, and foundries. The streets are wide, straight, and generally well kept. The water supply is obtained from the St. Lucia River, at a point about 12 miles distant. Plazas, 16 in number, occupy high ground in the middle of the city, the most attractive of these public squares being the Zabala, Independencia, and Constitución. The University of Uruguay has more than 400 students and a relatively very large number of native and foreign professors; there are also normal and elementary schools, a military college, etc. Banks are: English (2), and Italian, Spanish, and French (1 each). For courts, library, museum, and periodicals, see URUGUAY. No city in South America is more cosmopolitan in character: nearly all the languages of the civilized world are heard in its streets. The environs contain beautiful residences, surrounded by gardens; at a distance of about three miles from the city is the fine park called El Prado. Montevideo was taken by a British force of 4,600 men on 2 Feb. 1807, after a vigorous assault by land and sea (English fleet under Commodore Popham). Subsequently the combined English forces in the river, under command of Gen.

Whitelocke, were defeated at Buenos Ayres, and, withdrawing from Montevideo, abandoned the Rio de la Plata. MARRION WILCOX, *Authority on Spanish America.*

Montevideo, Department of. See URUGUAY.

Mon'tez, Lola (assumed name of MARIE DOLORES ELIZA ROSANNA GILBERT), adventuress: b. Limerick, Ireland, 1818; d. Astoria, N. Y., 17 Jan. 1861. Her parents took the child to India, where her father died, and her mother, again marrying, sent Lola back to Europe. In 1837 she married a Captain James, went to India with him, tired of him, and returned to England in 1842. She next became a public dancer, performing in London and in cities of the Continent, and in 1846 went to Munich, where she fascinated the old artist-king Louis I. of Bavaria, who made her his mistress, created her Countess of Landsfeld, and granted her a large annuity. For a while she also exercised great political power, which she directed against the Jesuits and in favor of liberalism; but with the outbreak of the revolution of 1848 she was once more set adrift. In London she married a guardsman, Stafford Heald, was soon divorced from him, and in 1851 sailed for the United States. After touring through this country with a play called 'Lola Montez in Bavaria,' she went to Australia, returned here, was twice married in California, and in 1858 lectured in New York where she settled and spent her last days in rescue work among women. Her writings include 'Lectures,' with an autobiography, and 'The Arts of Beauty' (1858).

Montezuma, mōn-tē-zoo'mā (Aztec MORECUHZOMA, the severe or sad one; found written also MONTEÇUMA, MOCTEZUMA, MUTEZUMA, MOTEZUMA), surnamed ILHUICAMINA (archer of heaven) and called MONTEZUMA I., chief, or emperor, of ancient Mexico: b. about 1390; d. 1464. He succeeded his brother Izcóhuatl in the chieftainship in 1436, but was not inaugurated until 1440. His success in war with neighboring tribes was great, and he is said to have extended Mexican conquest to the Gulf. With Netzahualcoyotl, chief of Tezcuco, he built, to prevent inundations from Lake Tezcuco, huge dams, the ruins of which in the San Lorenzo Valley have shown them to have been a marvelous feat of engineering. He also rebuilt Tenochtitlan (on the site of the modern Mexico), the chief Aztec city, substituting for the primitive buildings others of lime and stone; established a severe legal code; and developed the ceremonial and influence of the tribal religion.

Montezuma, surnamed XOCOYOTZIN and called MONTEZUMA II., chief, or emperor, of ancient Mexico: b. 1479 (authority of Bernal Diaz); d. Tenochtitlan, Mexico, 30 June 1520. He is well known as the ruler of the Aztecs at the time of the Spanish invasion. He succeeded his uncle Ahuizotl as chief in 1503. Almost constant wars were carried on by him with the Tarascans and Tlascalans, and he is said to have led an expedition as far south as Honduras. His internal policy was in many respects wise. He severely enforced the laws, introduced valuable changes in the courts, and built many public works, including temples, a new conduit for the water-supply, and a hospital for invalided warriors. But by his arrogance and

MONTEZUMA — MONTFORT

pomp, his seclusion, his restriction of appointments to those only of noble rank, and his heavy taxation he made himself greatly disliked. His conquests enlarged the empire, but the various parts were without cohesion, and insurrections were frequent. When news was brought in 1518 that ships and white men (of Jean de Grijalva's expedition) had been seen off the coast, Montezuma was greatly alarmed, because an ancient prophecy foretold that Quetzalcoatl, the white god, would at some time come to reign over Mexico. He sent presents to Cortéz, who had landed at Vera Cruz in April 1519, and tried to prevent him from marching to Tenochtitlan. Cortéz, however, arrived there in November, and was well received. Fearing an outbreak of the people, who did not agree with the conciliating policy of the monarch, Cortéz then took Montezuma prisoner, and retained him as a hostage in the quarters of the Spaniards. The Aztecs finally made an attack upon the quarters. (June 1520). Montezuma, at the request of Cortéz, attempted in a speech from the wall to end hostilities, but was wounded by a volley of stones and died four days later. The Indians came to regard him as a deity, and indeed called him their chief god, though this reverence did not include worship. Consult: Prescott, 'Conquest of Mexico' (1843); H. H. Bancroft, 'Mexico,' Vol. I. (Vol. IX. of his 'Works' 1883-90); Bernal Diaz, 'Historia verdadera de la conquista de la Nueva España.'

Montezuma, Iowa, town, county-seat of Poweshiek County; on the Chicago, R. I. & P. and the Iowa C. R.R.'s; about 60 miles east of Des Moines. Agriculture and stock-raising are the principal industries of the surrounding region. Bituminous coal-fields are in the vicinity. The chief industrial establishments are a pearl-button factory, wagon factory, foundry, machine-shop, and a creamery. Pop. (1890) 1,062; (1900) 1,210.

Montfaucon, Bernard de, bār-nār dē mōn-fō-kōn, French critic and classical scholar: b. Languedoc, France, 18 Jan. 1655; d. Paris 21 Dec. 1741. He entered the army but resigned to become a Benedictine monk and devoted himself to classical studies. His 'Palæographia Græca,' published in 1708, made him famous and constituted him the founder of scientific palæography. He traveled in Italy where he was honored by Innocent XII. and in 1719 was elected a member of the Academy of Inscriptions. In the course of his work he examined thousands of manuscripts and his books are a storehouse of classical archæology. Among them are: 'L'Antiquité expliquée et représentée en Figures' (15 vols. 1719-24); 'Monuments de la Monarchie française' (5 vols. 1729-33).

Montferrat, mōn-fēr-rā, Italy, a former independent duchy, bounded by Piedmont, Genoa, and the Milanese territory. It lay in two detached portions between the Maritime Alps and the Po, and had an area of about 1,000 square miles. The capital was Casale. Mention is made of a Marquis of Montferrat in 980. In 1305 the marquisate was inherited by a branch of the imperial family of the Palæologi, and in 1536 was granted by Charles V. to Federico II., duke of Mantua. It was erected into a duchy by Maximilian in 1573 or 1574. In 1631 a considerable part of it was ceded to Savoy by

the Duke of Mantua, to whose ancestors Charles V. had granted it in 1536, and in 1708 the remainder was annexed to the same duchy. See SAVOY.

Montfort, mōnt'fōrt (Fr. mōn-fōr), **Simon de**, EARL OF LEICESTER, English political reformer: b. France about 1208; d. Evesham 4 Aug. 1265. His father was Simon, the Conqueror of the Albigenes, his mother, Alice of Montmorency; the former had been disinherited of his English estates by King John in 1207 and hence had joined the more readily the orthodox French party in fighting the Albigenes, who were led by John's brother-in-law, Raymond of Toulouse. But the younger and greater Simon in 1229 was forced to leave France and throw himself on the mercy of the English king, Henry III., who restored him his lands in Leicester, and married him to his own sister Eleanor, secretly and without dowry in 1238. The irregularity of this match endangered Simon with the nobles, who had not been consulted; almost immediately afterward he quarreled with the king and was only saved by his crusader's vow, which he fulfilled under Richard of Cornwall in 1240. In France he fought under Henry III. (1242-8), who made him commander of the army in Gascony. There he crushed successive rebellions, but another quarrel between the monarch and his subject followed and Simon was removed from office. Henry soon had to recall Simon, who in 1257 and 1258 quarreled hotly with William of Valence, one of the king's foreign favorites and his half-brother. Simon's boldness in this matter put him at the head of the movement among the barons for administrative reform. In June 1258 the 24 commissioners, of whom he was one, drew up the famous Provisions of Oxford, signed in October of the same year, but repudiated in 1262 by the king. Simon de Montfort had been actual head of the reforming party since the conclusion of the peace with France (4 Dec. 1259), which had made reform possible. Now, after the cause of the nobles had been submitted to the King of France to arbitrate and his sentence had been entirely favorable to the king, setting aside the Oxford Provisions entirely, and reserving to the people only such rights as they had before possessed, Simon put himself at the head of the party which was eager to fight for the privileges of the nobles. On 16 May 1264, after a brilliantly conducted engagement, Simon captured the king; a new constitution was formed giving the power to a council of nine, over whom were three electors, removable by Parliament; and in this new régime Simon was practically master of the kingdom. He summoned a Parliament 30 Jan. 1265, which was the actual basis of the present English Parliament and of British constitutional freedom. But the Parliament was marked by a quarrel between Simon and the Earl of Gloucester; the latter went over to the border nobles. Simon moved against him with splendid fearlessness; made a sudden peace with the Welsh king; and turning to meet Gloucester failed to effect a juncture with his son. At Evesham on 4 Aug. 1265 he was slain, his forces being so outnumbered by the troops with Gloucester and Prince Edward that at sight of the enemy Simon is said to have exclaimed, "Let us commend our souls to God, for our

MONTGOLFIER—MONTGOMERY

bodies are theirs." Personally haughty and high tempered, but sober, simple, pious, and cultured, he was a great general, one who stood firmly by the right, the idol of the people, who made his tomb a shrine and carried on the work he had begun. To call him the "creator of the House of Commons" is a misapprehension of his work, which forwarded rather than fathered representative government. Consult: Pauli's life which treats primarily of the constitutional bearings of Montfort's career and is translated into English by Miss Goodwin (1876); the English life by Prothero (1877); the French biography by Bémont (1884), which first untangles Montfort's continental career; the 'Song of Lewes,' edited by Kingsford (1890); the 'Miracles of Simon de Montfort,' edited by Halliwell for the Camden Society (1840), showing the popular canonization of the hero; and such general works as Stubbs, 'Constitutional History,' Vol. II., and Green, 'History of the English People,' Vol. I.

Montgolfier, mōnt-gōl'fî-ër (Fr. mōn-gōl-fē-ā), two French inventors, JOSEPH MICHEL (b. Vidalon-les-Annonai, France, 1740; d. Balarue-les-Bains, 26 June 1810); and JACQUES ETIENNE (b. Vidalon-les-Annonai, 7 Jan. 1745; d. Servières, 2 Aug. 1799). They were sons of a paper-maker and devoted themselves to the study of mathematics, mechanics, physics, and chemistry. As their scientific labors were always carried on in combination it is not easy to decide to which of the two the credit of their several inventions is due. The first idea of the balloon seems to have arisen in the mind of Joseph, but Jacques Etienne suggested many improvements upon it. Joseph was also the inventor, among other things, of the water-ram which raises water to the height of 60 feet, and Jacques Etienne of vellum paper, which he was the first to make in the manufactory formerly carried on by his father. See BALLOON.

Montgomery, mōnt-gūm'ē-rī, **Florence**, English novelist: b. 1843. She was a daughter of Admiral Montgomery, 3d baronet, and began her literary career through the encouragement of Whyte Melville, the novelist. Among her books are: 'A Very Simple Story' (1866); 'Misunderstood,' a pathetic fiction and the work by which she is best known (1869); 'Thrown Together' (1872); 'Transformed' (1886); 'Prejudged' (1900).

Montgomery, mōn - gūm - ē - rē, **Gabriel**, COMTE DE, French captain: b. about 1530; d. Paris 26 June 1574. He was son of the commander of the Scottish troops in the service of the French court, but in 1559 he accidentally wounded King Henry II., with whom he was jousting, and killed him. Montgomery was condemned to retirement in the country, where he read many religious books, and was soon led to join the Protestant party. In 1562 he entered Condé's army; served with much bravery and ability; and in 1574 was captured, taken to Paris, tried, and executed. Consult Marlet, 'Le Comte de Montgomery' (1890).

Montgomery, mōnt - gūm'ē - rī, **George**, American Roman Catholic archbishop: b. Daviess County, Ky., 30 Dec. 1847. He was educated at St. Charles College, Md., and St. Mary's Seminary, Baltimore, and was ordained to the priesthood in 1879. He officiated as a priest for

15 years in San Francisco and in 1894 was consecrated coadjutor bishop of Los Angeles. He was elevated to the rank of coadjutor archbishop of San Francisco in 1902.

Montgomery, James, British poet and journalist: b. Irvine, Ayrshire, 4 Nov. 1771; d. Sheffield, Yorkshire, 30 April 1854. In 1792 he procured an engagement with a bookseller in Sheffield, the proprietor, editor, and publisher of the Sheffield 'Register.' Montgomery succeeded him later as editor and publisher of the paper, the name of which he changed to the Sheffield 'Iris.' The conducting of a liberal journal was at that period fraught with manifold dangers. He was twice prosecuted for trivial offenses, and condemned on the first occasion to three and on the second to six months' imprisonment. During his confinement he composed a volume of poems, 'Prison Amusements,' published in 1797. In 1806 appeared his 'Wanderer in Switzerland,' the first popular effort of his. It was followed in 1809 by the 'West Indies,' a poem designed to expose the iniquities of the slave-trade. Later volumes were 'The World before the Flood' (1813); 'Greenland,' a missionary poem (1819); and 'The Pelican Island' (1827). In 1825 he resigned the editorship of the 'Iris,' and henceforward spent his life in religious and literary labors, and to the world of to-day he is known as a hymn writer, over 100 of his hymns still keeping their places in hymnals.

Montgomery, John Berrien, American naval officer: b. Allentown, N. J., 17 Nov. 1794; d. Carlisle, Pa., 25 March 1873. In 1812 he entered the navy as midshipman and was on board Perry's flagship at the victory on Lake Erie in 1813 where he performed excellent service and received the thanks of Congress. He was later engaged at Mackinaw in 1814 and in 1815 served in the Algerine war. In 1839 he became commander, and in the war with Mexico commanded the Portsmouth and established United States authority on the coast of California, blockaded Mazatlan, and assisted in the capture of Guaymas. In 1849-51 he was executive officer of the navy-yard at Washington and he commanded the Pacific squadron in 1861-2. He was made a commodore in 1862 and rear-admiral on the retired list in 1866. Consult: 'A Genealogical History of the Montgomery Family' by T. H. Montgomery (1863).

Montgomery, Richard, American soldier: b. Convoy House, near Raphoe, Ireland, 2 Dec. 1736; d. Quebec 31 Dec. 1775. At 18 he obtained a commission in the British army, in 1757 began his career of active service in America, and at the siege of Louisburg in 1758 and elsewhere gave evidence of high military capacity. In 1772 he sold out his commission, and emigrating to New York, settled in Rhinebeck, Dutchess County. In 1775 he represented Dutchess County in the provincial Congress, and in the same year was appointed one of the eight brigadiers to serve in the newly organized army of the united colonies. He was immediately attached to the larger of the two divisions sent to Canada in the summer of 1775 and by a series of well directed movements successively acquired possession of Chambly, St. John's, and Montreal, thereby becoming in the middle of November master of a great part of Canada.

MONTGOMERY

Effecting a junction on 4 December with Arnold's troops, then recently arrived, he immediately proceeded to take a position before Quebec. At a council of officers it was determined to attempt to capture the place by a *coup de main*, and accordingly, on 31 December at 2 A.M., an attack on the town was begun. Montgomery, who headed the attack on the Cape Diamond bastion, fell dead at the first and only discharge by the British artillerymen. His men, panic-stricken by the loss of their leader, began a disorderly retreat, and the assault on the city ended in failure. He was interred within the city walls. Congress testified "their grateful remembrance, profound respect, and high veneration" for him, by erecting a monument to his memory in the front of St. Paul's church, New York. In 1818 the State of New York caused his remains to be removed and placed beneath the monument.

Montgomery, Robert, English poet and Anglican clergyman: b. Bath 1807; d. Brighton 3 Dec. 1855. He is chiefly famous for having been mercilessly ridiculed by Lord Macaulay in the 'Edinburgh Review.' Having taken orders in the Church of England, he officiated at Percy Street chapel in London till his death in 1855, with an interval of four years as pastor of St. Jude's Episcopal chapel in Glasgow. His chief works, which amply justify Macaulay's strictures, though hardly their tone, are 'The Omnipresence of the Deity' (1828); 'Satan' (1830), whence his sobriquet of "Satan Montgomery"; and 'The Messiah.'

Montgomery, Ala., a leading Southern trade and social centre; State capital and second city of the State in population, and seat of Montgomery County, a little southeast of the centre; on the left bank of the Alabama, 410 miles above the Gulf by water and 180 by rail. It is the greatest railroad centre in the State, seven lines converging there, the Louisville & Nashville, Mobile & Ohio, Atlantic Coast Line, Central of Georgia, Seaboard Air Line, Union Springs & Northern, and Western of Alabama; 45 passenger trains a day arrive and depart from its union station.

Montgomery lies in the heart of the famous Black Belt, the band of rich dark soil which stretches across and beyond Alabama, 50 miles wide, and one of the chief cotton districts in the country, as well as a great producer of grain, fruit, and vegetables. It is the great central market of all this territory, and one of the foremost trucking centres for the supply of vegetables to the Northern markets; its wholesale grocery business amounts to some \$10,000,000 a year, out of a total business of over \$40,000,000. It is one of the chief cotton marts and distributing points of the South, handling 150,000 to 175,000 bales a year in its extensive warehouses. The export of this is to some extent sent in barges down the river to Mobile, and there reloaded for foreign shipment. The Alabama is one of the best rivers in the United States for steamer navigation, having a deep, broad channel open as high as Montgomery for eleven months in the year; and a weekly line of large freight steamers, with a gross annual tonnage of over 500,000, runs between Montgomery and Mobile, besides two other lines.

Lying between the coal and iron fields on the

north and the vast forests of yellow pine on the south, as well as in the midst of the cotton belt, the city has great natural advantages for manufacturing; and a dam across the Tallapoosa at Tallahassee, 30 miles away, furnishes 5,000 horse-power soon to be applied to its manufactories, at present used for trolley and lighting. Even now the city's interests are considerable and varied. In 1900 it had 163 establishments, employing \$2,930,782 capital and 2,563 workmen and clerks, paying \$802,183 in wages, and turning out \$5,035,190 in products. Car-shop and foundry work for the numerous railroads, with boilers and other iron goods, was the largest item; but there are two cotton factories and a cordage factory; four ginning and compress plants; three cottonseed-oil and cake works and two great fertilizer plants; 13 wood-working and lumber concerns, besides cooper-age works (mainly for the oil and allied products), carriages, furniture, etc.; confectionery, a heavy interest; crackers; brooms and brushes and paper boxes; saddlery and harness; brick and tile, paving and roofing materials, from the clays close at hand; malt and distilled liquors, ice, and other things. Its banking facilities have kept pace with the increase. It has three national and one private bank. The bank capital on 31 Oct. 1902 was \$748,700, their deposits \$3,485,324, their reserves \$4,697,613, their surplus of undivided profits \$335,032, a large increase in all lines from the year previous. The post-office receipts had increased 25 per cent within five years. There are two trolley systems covering city and suburbs and electric light, good sewerage, and artesian water almost chemically pure; the streets are well paved, and the country roads radiating from it of remarkable excellence. Assessed valuation, about \$20,000,000. The mayor and city council are elected for two years, and the latter confirms all appointments of the former to other city offices. Of about \$300,000 yearly expenditure aside from interest on debt, \$30,000 is for schools.

The city is handsomely built on a high red-clay bluff bordering the river, and stretching back to undulating hills; it has many fine old gardens, and 50 acres of public parks. The centre is Court Square, and the foundation streets are Court Street, Commerce Street toward the river, and Dexter Avenue to the capitol. The splendid new union station costing \$250,000, the government building, the city-hall and court-house, the Masonic Temple, and the Carnegie Library, are the chief structures in the centre. Estelle Hall, the Fanenil Hall of the city, is historically interesting from the great political speeches made in it. The capitol dates from 1851; in its grounds is a handsome Confederate monument. There are about 50 church societies, of all denominations; several of them with handsome, modern edifices. There is a State Normal School for the colored here, the Baptist Academy, Lagrange Academy, the Montgomery Industrial School for Girls, and charitable institutions. There are three daily newspapers, and several institutional libraries. The population in 1840 was 2,179; 1850, 6,728; 1860, 8,843; 1870, 10,588; 1880, 16,713; 1890, 21,883; 1900, 30,346, of whom 17,244, or 57 per cent, were colored. Its suburbs, however, have far overspread the official limits, and the aggre-

COURT SQUARE AND DEXTER AVENUE, MONTGOMERY, ALA.

MONTH — MONTI

gate population within a few miles is toward 50,000.

Montgomery was founded in 1817 by Andrew Dexter of Rhode Island, on the site of the legendary Indian village of Ecunchatty; it was part of the Creek lands. Dexter named the place New Philadelphia; the situation was tempting, and in 1818 two more settlements were made.—East Alabama Town closely adjoining, divided by the present lower Court Street (whence the streets on its two sides run from it at different angles), and Alabama Town a mile or so down the river. On 3 Dec. 1819 the former was consolidated with it as Montgomery; named either after the Indian fighter Lemuel Montgomery or the Revolutionary hero Richard Montgomery. The early society was like many pioneer communities, and vigilance committees had to be invoked to restore the reign of law. The first steamer arrived 22 Oct. 1821; the Montgomery Railroad opened its first 12 miles in 1840. The place received a city charter in 1837; on 22 Jan. 1846 it was made the State capital; the capitol was occupied 1847, burned 1849, replaced by the present in 1851. Its interests and excessive colored population made it the focus of the secession movement; its position as capital drew in some of the ablest leaders and orators of the South, the famous William L. Yancey being one; and it was made the first capital of the Southern Confederacy, whose government was organized there 4 Feb. 1861. The next year the capital was removed to Richmond; the Union army reoccupied Montgomery 12 April 1865. L. L. GILBERT,

Sec'y the Commercial and Industrial Association, Montgomery, Ala.

Month, a period of time derived from the motion of the moon. The "sidereal" month may be regarded as the period in which the moon, as seen from a fixed star, would appear to make a complete revolution round the earth; it is evidently the period in which she passes through the 12 signs of the zodiac; its mean value during the year is 27.32166 days. The "synodical" month, more commonly called a "lunar month" or "lunation," is the period during which the moon goes through all her phases. It is usually reckoned from new moon to new moon; to complete the lunation the moon must not only pass through the 12 signs of the zodiac, but also come again to occupy her old position relatively to the sun, which has itself advanced in the zodiac, hence the lunar is longer than the sidereal month. The mean value of the lunation is 29.5306 days. The "solar" month is the 12th part of one solar year, or 30.4368 days. The "anomalistic" month is the period in which the moon passes from perigee to perigee of her orbit; it differs from the sidereal month because the perigee varies its position. The line of nodes of the moon's orbit varies its position, and the "nodical" month, or the period of her motion from ascending to ascending node, differs from the other months mentioned above. The 12 civil or calendar months of the year have from 28 to 31 days each. The lunar month was used by the Chaldeans and Egyptians, and is still by the Jews, Turks, and many uncivilized nations. The calendar months are not equal divisions of the year, some (April, June, September, and November) consisting of 30, and the remainder of 31 days, except February, to which a period of

only 28 days is assigned (see LEAP YEAR), with the addition every fourth year of one more day. These distinctions often give rise to much confusion as to the time intended to be designated by a month. In popular language it is often understood to be four weeks, as this is very nearly an equal period, expressed in the division by weeks, to the month. This is even laid down by Blackstone as the legal definition of the term, so that a lease for 12 months is only for 48 weeks; but the expression of "a twelve-month" has been legally held to mean a solar year. See CALENDAR.

Monthonol, Charles Tristan, shārl trēs-tān mōn-tō-lōn, COMTE (later MARQUIS) DE, French soldier: b. Paris 21 July 1783; d. 21 Aug. 1853. After service in the navy, he entered the army in 1798, took part in the Napoleonic campaigns in Italy, Austria, and Prussia, distinguished himself at Wagram (5-6 July 1809), was made chamberlain (1809), was sent on an important diplomatic mission to the Archduke Ferdinand of Austria (1811), and became general of brigade (1814). During the Hundred Days he was adjutant-general to Napoleon, whom he accompanied to St. Helena, and by whom he was appointed an imperial executor. Proclaimed chief-of-staff by Prince Louis Napoleon in 1840, he was therefore condemned by the Peers to 20 years' imprisonment, but was liberated after the February revolution (1848). He published 'Mémoires pour servir à l'Histoire de France sous Napoléon, Ecrits à Sainte Hélène sous sa Dictée' (with Gourgaud 1822-5; 2d ed. 1830), and 'Récits de la Captivité de Napoléon' (1846).

Month's Mind, the name given to the requiem mass celebrated in the Roman Catholic churches the 30th day after decease of the person for whom the mass is offered. The prayers of the mass are the same as those of the requiem mass celebrated on the day of decease or burial except the "Collect," "Secret," and "Post-Communion." Consult: 'Missal'; O'Brien, 'The Mass'; Sullivan, 'History of the Mass.'

Monti, Vincenzo, vên-chënd'zō mōn'tē, Italian poet: b. Fusignano near Ravenna 19 Feb. 1754; d. Milan 13 Oct. 1828. He became secretary to Prince Luigi Braschi, won his literary spurs with 'Saggio di poesie' in 1779, gained speedy popularity with various occasional odes, and in 1787 and 1788 brought out his two great tragedies, 'Aristodemo' and 'Galeotto Manfredi,' both in the style of Alfieri. His 'Bassvilliana,' a Dantesque poetic chronicle of recent happenings, notably the massacre of the French envoy Basville by the Roman populace, showed ability to treat a theme in politics; but from the detestation expressed in that poem for the excesses of the Revolution, and his appeal to the Austrians against the French, he soon came to the most ardent praise of Napoleon, and fled to France to escape punishment from Austria. His panegyric of the mathematician Mascheroni (1801) is largely an attack by the poet upon his personal enemies. After Marengo he returned to Italy, and became professor of oratory at Pavia, imperial poet-laureate in Milan, and, after the coronation of Napoleon, historiographer of the Italian kingdom. From that time until the restoration of Austrian rule in Italy, Monti was devoted to Napoleon and sang repeatedly odes of victory in his honor.

MONTICELLI — MONTICELLO

In his latter years he joined his son-in-law Giulio Perticari, in his fight with the Della Crusicans, and published his single great work, a version of the 'Iliad' (1810). His translation of Persius should be mentioned and his most successful drama, 'Caio Gracco' (1802). Monti was an ardent classicist, and in his 'Sermone sopra la mitologia' (1825) combated romantic tendencies. Consult the biographies and appreciations by A. Monti (1873), Vicchi (1879-87), and Zumbini (1894); and the Milan (1839), or Florence edition (1817) of his works.

Monticelli, mōn-tē-cēl'lē or mōn-tē-chēl'lē, **Adolphe**, French painter: b. Marseilles 1834; d. there 1886. He began his art studies at the academy of his native city, but early turned his steps to Paris, where he painted under the eye of Delacroix and Diaz. His first manner bears traces of Titian's influence, but he also imitated the masters of the Dutch and Flemish schools. His portraits recall the dignity and ease of Velasquez; but he especially excelled in painting such festal gatherings of high society as Watteau loved to depict. His fine ladies and gentlemen are etherialized into a grace, elegance, and lustre more than mortal, and such pictures as his 'Court of Henry III.' are almost to be called scenes from romance and fairyland. Coloring and drawing are alike admirable in all his productions, but at last his style degenerated into extravagance; he reached the condition of mental alienation described by Balzac in his 'Chef d'œuvre inconnu' and died in great poverty.

Monticello, mōn-tē-sēl'lō, Ark., town, county-seat of Drew County; on the Saint Louis, Iron Mountain & Southern railroad; about 81 miles south by east of Little Rock. It is in a cotton growing and lumbering region. The industries and trade are connected with lumber, fruit, cotton, and grain. Some attention is given to stock raising. It is the seat of the Hinemon University school and has the Arkansas Orphans' Home (Baptist). Pop. (1890) 1,285; (1900) 1,579.

Monticello, Fla., town, county-seat of Jefferson County; on the Florida C. & P. (Seaboard Air Line), the Savannah, F. & W. (Plant System) R.R.'s; about 32 miles east by north of Tallahassee. It is in an agriculture section, where the chief product is fruit. Monticello prepares and ships for northern markets large quantities of fruit. Pop. (1890) 1,218; (1900) 1,076.

Monticello, Ill., city, county-seat of Piatt County; on the Illinois C. and the Wabash R.R.'s; about 147 miles south by west of Chicago. It is situated in an agricultural and stock-raising region. Its chief manufactures are foundry and machine shop products, dairy products, patent medicines, tile, brick, wagons, and carriages. It is the trade centre for a large part of Piatt and the nearby counties, and ships considerable hay, live-stock and vegetables. Pop. (1890) 1,643; (1900) 1,982.

Monticello, Ind., town, county-seat of White County; on the Tippecanoe River, and on the Chicago, I. & L., and the Pittsburg, C., C. & St. L. R.R.'s; about 75 miles north by west of Indianapolis. The river furnishes good water power for manufacturing. The chief manufac-

turing establishments are flour and lumber mills and creameries. The town owns and operates the waterworks. Pop. (1890) 1,518; (1900) 2,107.

Monticello, N. Y., village, county-seat of Sullivan County; the terminus of the Port Jervis, Monticello & New York railroad; about 67 miles northwest of New York city. It is situated in an agricultural region from which large quantities of potatoes, apples and a considerable amount of dairy products are shipped to New York markets. The village is a favorite summer resort on account of its pleasant climate and beautiful scenery. Pop. (1890) 1,518; (1900) 2,107.

Monticello, mōn-tē-sēl'lō (Little Mountain), the estate and residence once owned by Thomas Jefferson (q.v.), third president of the United States. It is in Albemarle County, Va., about two miles from Charlottesville. The estate was an unbroken forest in the early part of the 18th century, until in 1735 the land came into possession of the father of Thomas. Peter Jefferson, the father, and his brother-in-law decided to "go West" and try a new country, so they left the tide-water settlements on the James River and journeyed about 100 miles toward the west, to what is now Albemarle County, and located 20 miles east of the Blue Range and among the foot-hills of the Southwest Mountains. Peter Jefferson "patented" a tract of land of about 1,000 acres. In looking over his new possession he found no site for a home, such as pleased him; his neighbor, Randolph, sold him from his tract 400 acres for "Henry Weatherbourne's biggest bowl of arrack punch." The place was then called Shadwell, after Shadwell Street in London, and the country around Goochland. Thomas Jefferson was born in the old residence at Shadwell, and this house was his home for 27 years. From his boyhood his favorite spot on the estate was Little Mountain. Often he and his most intimate friend, Dabney Carr, afterward his brother-in-law, ascended the mountain in the twilight, and in the long vacations they studied many an hour under an oak tree, their favorite of the forest. They agreed that whichever one died first, the other would have buried under this tree, and at an early age Dabney Carr was here laid to rest. Later Jefferson, his wife, two daughters, and others of his descendants were buried in the little cemetery which was formed around this oak.

It was when Jefferson was a member of the house of burgesses of Virginia, to which he was elected in 1769, that he began the erection of his residence on the summit of the world-renowned eminence, Monticello. (Jefferson changed the English name to the Italian, Monticello.) The Shadwell mansion was on a hill on the north bank of the Rivanna River, and Monticello is south, just where the stream cuts its channel through the outlying range of the Alleghanies, the Southwest Mountains. On the northeast Monticello has a steep rocky base, washed by the Rivanna, on the southwest is a dip of about one third the height of the mountain which connects it with Carter's, a higher peak. Monticello is yet covered by a dense growth of timber, mainly hardwood deciduous trees.

MONTIJO — MONTORSOLI

Before the residence on Monticello was completed, the Shadwell mansion was burned down, 1 Feb. 1770. The first building on Monticello was a brick story-and-a-half structure containing one good-sized room and some smaller rooms; it still stands as the south pavilion. Here he brought his bride in 1772. He was often absent from this beloved home, but his own manuscripts, especially his garden-book, show his love for a quiet domestic life. This same garden-book shows that in 1769 he planted a variety of fruit trees on the southeast slope of the mountain, many of them still in existence. The house was enlarged to suit the needs of the family, and in accordance with the owner's plans. From his European journeys he brought back many new ideas, so that the architecture of the house is somewhat complex. It has the appearance of an Italian villa, with a Greek portico, and considerable of the features of Colonial architecture. The Marquis de Chastellux, in a book of travels mentions a visit to Monticello in 1782, and says of Jefferson: "He is the first American who has consulted the fine arts to know how to shelter himself from the weather." Architecture in America has advanced since that time. Some of the plans, drawn by Jefferson himself, are still in existence. The part of the home that was to last was made of good material and possessed a certain elegance, but the furniture was most simple. His last days saw the estate of Monticello so deeply in debt that it was feared he would have to end his life an exile from his beloved mountain. He sacrificed some of his estate hoping to save the residence and some land for his daughter. His friends assisted him so the estate was not lost to the Jefferson heirs until after his death; it had been his home for 56 years. The present owner keeps the mansion in good repair and there is much about it similar to the old Monticello. No debt was allowed to defame the name of Jefferson; Thomas Jefferson Randolph, the grandson, and his daughters paid every dollar of debt their eminent ancestor owed after Monticello had been sold. The great-granddaughters kept a school to assist their father in paying this debt. Consult: 'Century Magazine,' Vol. XII, p. 643, article by Nicolay, 'Monticello; Home of Jefferson'; Craighill, 'The Virginia Peerage'; Foote, 'Sketches from Old Virginia.'

Montijo, mōn-tē-zhō, Eugénie-Marie de. See EUGÉNIE, EMPRESS OF THE FRENCH.

Montjoie St. Denis, mōn-zhwā sǎn dèn-ē, a French war cry dating from the 12th century. The name is derived from the hill near Paris on which St. Denis suffered martyrdom.

Montmagny, Charles Jacques Huault de, shārl zhāk ū-ōlt də mōn-mān-yē, French colonial governor; d. France, about 1649. He was Canada's second governor-general, 1636-48, and proved himself a wise and able ruler. The condition of the colony improved under his administration, he defeated the Iroquois and concluded a treaty with them at Three Rivers in 1645; and had begun the subjugation of the Hurons when he was recalled in 1647. Under his rule the Jesuits made extensive explorations and settlements, but though deeply religious Montmagny disapproved of the founding of Montreal, considering it a weakening of the missionary forces.

Montmartre, mōn-mār-tr, France, a northern district of Paris, a former suburban village, on a conical hill commanding an extensive view of the metropolis. See PARIS.

Montmorency, mōn-mō-rōn-sē, Anne, Duc de, French soldier; b. Chantilly 15 March 1492; d. Paris 11 Nov. 1567. He was a distinguished general in the wars of Francis I., and was taken prisoner at Pavia (1525). In 1538 he was made constable of France, but by a rapid change of fortune was banished the court in 1541 under suspicion of conspiracy. He was restored by Henry II. (1547), in 1557 was defeated by the Spaniards and taken prisoner at St. Quentin, and in 1562 was again captured while commanding against the Huguenots at Dreux. In 1563 he drove the English from Havre, and in 1567 received a fatal wound in the battle against Condé at St. Denis. There is a 'Life' by De-crue (1885-9).

Montmorency, Henri, Duc de, French soldier; b. Chantilly 30 April 1595; d. Toulouse 30 Oct. 1632. In 1612 he purchased the vicereignty of Canada from the Prince of Condé for 11,000 crowns, and was wise enough to retain Champlain in command at Quebec. He wearied, however, of the post, which gave him constant trouble, and in turn sold it. His services against the Huguenots in the civil wars were distinguished, and included a victory over the Duc de Rohan in 1628; but he took part in the insurrection of Gaston of Orleans in 1629, was made prisoner, condemned for treason, and beheaded.

Montmorency, mōnt-mō-rēn'sī (Fr. mōn-mō-rōn-sē), Falls of, Canada, a beautiful cascade near the mouth of the Montmorency River, on the Saint Lawrence River, 7 miles below Quebec. The river has an irregular course north and south of about 15 miles, and just above its confluence with the Saint Lawrence falls over a precipice 242 feet high, and 100 feet wide at its crest. The falls are visited by great numbers of tourists, and are utilized to supply the power necessary for the electric plants of Quebec.

Montejo, mōnt-ō'hō. Patricio, Spanish naval officer; b. 1833. He entered the navy when a young man, and at the outbreak of the Spanish-American war was in command of the Spanish fleet in the Pacific. This force was attacked by the American Pacific squadron under Dewey in Manila Bay 1 May 1898. Montejo's flagship, the Reina Christina, was successively engaged by the Olympia, Baltimore, Raleigh, and Boston, received 70 shots, which killed 52 men and wounded 150; and finally caught fire. Montejo transferred his flag to a gunboat. In September 1899 he was court-martialed in Madrid; urged in his defense that the fault of the defeat was the Spanish government's, as it had not given him proper equipment; and was retired without right of promotion.

Montorsoli, Fra Giovanni Angelico da, frā jō-vān'nē ān-jēl'ē-kō dā mōn-tōr'sō-lē, Florentine sculptor; b. Montorsoli 1507; d. Florence 1563. He was a member of the religious order known as Servites; worked at Genoa, after retiring from that order, and by building the Serra and Doria palaces and adding a chantry and Doria tomb to the church of San Mateo, established his reputation as a sculptor and architect (1525). He was soon afterward engaged as assistant

MONTOUR—MONTPENSIER

by Michelangelo in his work on the Chapel of the Medici at Florence. Among his productions are the fountain in the Cathedral square at Messina (1547); he also designed several chapels in the cathedral there and built the lighthouse.

Montour, mōn-toor', **Esther** (called "Queen Esther"), American half-breed Indian of the 18th century. She had French blood in her veins and was supposed to have been a descendant of Count de Frontenac, governor of New France. She married Eghobund, chief of the village of Sheshequin, and her keen intelligence enabled her to completely dominate the Senecas over whom she reigned as "Queen Esther." She was friendly to a Moravian mission which was located near her village for some years, and accompanied the delegates to various congresses of the Six Nations in Philadelphia, where she was well received among the best people owing to her pleasing manners and beautiful person; but in the Wyoming massacre in July 1778 the savage in her nature asserted itself and to avenge the death of her son she deliberately tomahawked 14 prisoners. Consult Cook, 'General Sullivan's Indian Expedition' (1887).

Montpelier, mōnt-pēl'yér, Vt., city, capital of the State, county-seat of Washington County; on the Winooski River, and on the Central V., the Montpelier & W. R., and the Montpelier & B. R.R.'s; about 38 miles southeast of Burlington. It is situated in a beautiful valley surrounded by hills, and in an agricultural region. In the vicinity are valuable granite quarries. The chief industrial establishments are flour and lumber mills, machine shops, hardware and saddlery works, tannery, granite works, and creameries. It controls a large portion of the trade of the surrounding country, and ships considerable farm products, especially hay and potatoes, and also dairy products, poultry, granite, and lumber. One of the prominent buildings is the State capitol, a fine granite structure built in the form of a cross, the dome, 124 feet high, surmounted by a statue of Agriculture. A marble statue of Ethan Allen is at the entrance, under the portico. Another fine building is the Heaton Hospital, opened in 1896. The city has public and parish schools, the Washington County Grammar School, the Montpelier Seminary, under the auspices of the Methodist Episcopal Church, the Wood Art Gallery, the State Library, the Washington County Grammar and Montpelier Union School Library, and the seminary library. The government is administered under a charter of 1900 which provides for a mayor, who holds office one year, and a council. The mayor appoints, subject to the approval of the council, the police; and the council elects the health officer, overseers of the poor, superintendents of streets and water, and other officers. The waterworks, owned and operated by the city, were opened in 1884, and now (1903) comprise about 25 miles of mains. The water is brought from Mirror Lake, or Berlin Pond, situated about four and one half miles southeast of the city.

The land which is the town site was chartered in 1781, but the first permanent settlement was made in 1787 by people from Massachusetts. The town was organized in 1791, and in 1805 Montpelier was chosen as capital of the State. It was incorporated as a village in 1855. For

40 years it maintained town, village, and school district organizations, until 1894, when it was chartered as a city. Among the noted people who have lived in Montpelier are Admiral George Dewey and Rear-Admiral Charles E. Clark. Pop. (1890) 4,160; (1900) 6,266. Consult: Hemenway, 'Gazeteer of Vermont,' and 'History of the Town of Montpelier'; Thompson, 'History of Montpelier.'

Montpellier, mōn-pēl-lē-ā, France, chief town of the department of Hérault, on the Lez, six miles north of the Mediterranean, and 80 miles northwest of Marseilles. It is one of the handsomest towns of the south of France. Among its noteworthy features are the Peyrou, a splendid promenade, on which is the Château d'Eau, at the termination of a lofty double-arched aqueduct; the citadel; the cathedral; the Palais-de-Justice, the university buildings, and the Porte de Peyrou, a triumphal arch of the Doric order. Montpellier is well equipped with educational and other institutions, and since the 12th century has been famous for its school of medicine, said to have been founded by Arab physicians driven out of Spain. It is now merged in the celebrated University of Montpellier, which has also "faculties" of law, science, and literature, and an average annual attendance of 1,500 students; there is a public library of 130,000 volumes. The botanical garden, begun under Henri IV., is the oldest in France. Montpellier manufactures cottons, candles, soap, verdigris, chemicals, etc. It carries on an active trade, Cette serving as its harbor. Montpellier was a stronghold of the Huguenots, and suffered much in the religious wars. The edict of Montpellier (20 Oct. 1622) granted the free exercise of their religion to Protestants, and confirmed the Edict of Nantes. Pop. (1901) 75,950.

Montpensier, Anne Marie Louise d'Orleans, ān mā-rē loo-ēz dōr-lā-ān mōn-pōn-sē-ā, DUCHESSE DE, French princess, better known as MADemoisELLE of LA GRANDE MADemoisELLE; b. Paris 29 May 1627; d. there 5 April 1693. Her father was Gaston d'Orleans, Louis XIII.'s brother; and her mother was Marie de Bourbon-Montpensier, who died when her daughter was five days old, leaving her the richest princess of Europe. Her wealth, pride, and romantic disposition prompted her to a high match. In 1646 she refused the Prince of Wales, later Charles II., and her chance to marry Louis XIV. was ruined in 1652, when she sided with Condé, for whose protection she had the cannon at the Bastille fired on the royal troops. Upon her return to the court in 1657 she fell in love with Lauzun, a Gascon cadet, whom Louis refused to let her marry. Lauzun was imprisoned for ten years, but Mademoiselle seems to have married him secretly, in spite of the king, only to find him a brutal husband; they were separated and her last years were spent in pious devotion. Her 'Memoirs,' covering the years 1630-88, are particularly valuable for the light they throw upon the history of the Fronde; they are edited by Chéruel (1858). Consult Varine, 'La Jeunesse de la Grande Mademoiselle 1627-52' (1901).

Montpensier, Antoine Marie Philippe Louis d'Orleans, ān-twān mā-rē fē-lēp loo-ē dōr-lā-ān, Duc DE, French prince and claimant to the Spanish throne; b. Neully 31 July 1824;

MONTREAL

d. San Lucar, near Seville, 4 Feb. 1890. The 5th son of King Louis Philippe, he studied at the Collège Henri IV., entered the army in 1842, served in Algiers, and in 1846 married the Spanish infanta Maria Luisa Fernanda. After the revolution of 1848 he lived in England and Holland; then settled in Spain, where he received the title of Infante and was made captain-general of the Spanish army; was suspected of a plot against the crown and was exiled from Spain, returning only after the revolution of 1868. In 1870 he quarreled with the Duke of Seville, also a claimant for the throne, and killed him in a duel. During the reign of King Amadeus (1871-3), Montpensier was exiled to the Balears; upon his recall in 1873 he sided with Alfonso XII., and married to that prince his daughter, Maria de las Mercedes, who died without issue in 1878, the close of Montpensier's political activity. His eldest daughter married the Comte de Paris, and his only son became the husband of the Infanta Eulalia in 1886.

Montreal, mönt-rě-âl', Canada, the largest city and commercial capital of the Dominion, in Hochelaga County, Quebec, at the head of ocean navigation, on the left or northern bank of the Saint Lawrence River, 98½ miles by water from the Atlantic Ocean, 180 miles southwest of Quebec, and 420 miles north of New York.

Topography.—The city is built upon the southeast side of the triangular Montreal Island (q.v.), formed by the mouths of the Ottawa River, where after a course of 600 miles it flows into the Saint Lawrence. The length of the city is about four miles and its breadth two miles. It is narrowed near the middle by Mount Royal (whence the name Montreal is derived), which forms its chief ornament and most prominent feature, and rises boldly in rear of the city to the height of 735 feet, and is reserved and artificially improved so as to form a fine public park, affording at the observatory splendid views of the surrounding country; a large section of the city is built upon the lower slopes and terraces of the Mount.

The St. Lawrence at Montreal averages about two miles in width and is crossed at the narrowest point by the Victoria Jubilee Bridge, 1¼ miles in length and 60 feet high in the middle. It was built as a tubular bridge (1854-9) by the Grand Trunk Railway Company at a cost of \$6,000,000, but was remodeled (1898-9) as a vehicle and foot bridge, and renamed in honor of Queen Victoria's Diamond Jubilee, 1897. The river is also crossed by the Lachine bridge of the Canadian Pacific Railway near the city. A fine natural harbor for ocean-going ships has been greatly improved by extensive dredging and gigantic works and improving the wharfage accommodations. The ship channel between Montreal and Quebec has been dredged to a depth of 27 feet at an expense of about \$5,500,000.

The climate of Montreal is hot in summer, the temperature reaching often 96° in the shade; but the evenings and nights are cool; the winters are severe, the thermometer ranging from zero (F.) to 10° below it for weeks together. The establishment of a splendid electric street railway service now facilitates the removal of most of the snow from the main thoroughfares. The air is dry and bracing, and the climate is

considered very healthful both in summer and winter.

Public Buildings, Parks, Monuments, etc.—

Most of the public buildings and of the private dwellings of the better class are built of a grayish limestone quarried behind Mount Royal. The oldest structures in Montreal are two old towers in front of the Grand Seminary, built in 1694 for protection against the Indians. One of the oldest houses is the Château de Ramezay, opposite the city-hall. The chateau, which was formerly the official residence of the governors, is now occupied by the Numismatic and Antiquarian Society. The chief public buildings are the city hall, an imposing block in the modern French style, the post-office, the court-house, a handsome classical building; Bonsecours market, with a large dome; custom-house, and examining warehouse, harbor commissioners' offices, inland revenue office; and the churches, for which Montreal is famous. The most imposing church is St. James' Roman Catholic Cathedral, constructed on the model of St. Peter's at Rome, and with the following dimensions: total length, 330 feet; breadth at transepts, 225 feet; height to ridge of roof, 80 feet; height of dome with lantern, ball and cross, 250 feet; inside diameter of dome, 70 feet; width of nave, 40 feet—or, as nearly as possible, one-half of the size of the great church of Rome. The parish church of Notre Dame, a plain building in the Gothic style, 255 feet long, and 134 feet broad, will easily accommodate 10,000 persons, and when crowded has actually contained 15,000. Other Roman Catholic churches are Notre Dame de Bonsecours (1771), in the style of old Normandy, St. Patrick's Church, the Jesuits' Church, and Notre Dame de Lourdes. Among the Protestant churches are Christ Church Cathedral—one of the finest and purest specimens of decorated Gothic architecture on the continent; St. George's Church, St. Stephen's Church, Church of St. James the Apostle, St. James' Methodist Church, Crescent Street Presbyterian Church, American Presbyterian Church, St. Paul's, St. Andrew's, Erskine, and Knox churches. There are numerous benevolent institutions; among them being the new Royal Victoria Hospital, the jubilee gift of two prominent citizens, Sir George Stephen (afterward Baron Mount-Stephen), and Sir Donald Smith; and the Hôtel Dieu. The leading educational institutions are: M'Gill University, comprising faculties of arts, applied science, medicine and law; Presbyterian College (affiliated to M'Gill University), Wesleyan Theological College, Congregational College, Anglican Diocesan College, University of Bishop's College, M'Gill Normal School, and the Montreal School of Medicine and Surgery, all of which are Protestant. The leading Roman Catholic educational institutions are Laval University (a branch, the main institution being at Quebec), St. Mary's College, Montreal College, seminary of St. Sulpice, Jacques Cartier Normal School, Hochelaga Convent. There is also an excellent veterinary college. In addition to the libraries in the educational institutions, there is a public library at the Fraser Institute, and also at the Mechanics' Institute, while the library of the bar at the court-house comprises about 15,000 volumes, and is especially full in the department of French civil law. There are some

MONTREAL

handsome banks and insurance offices, fine hotels, two theatres, and several fine halls for entertainments; many public squares and pleasure-grounds, and among the latter St. Helen's Island, in the middle of the river, as well as Mount Royal. The best statues are those of Queen Victoria, in Victoria Square; of Maisonneuve, in Place d'Armes Square; of Sir John Macdonald, in Dominion Square; and of Queen Victoria (executed by Princess Louise, now Duchess of Argyle), in front of the Royal Victoria College for Women. Perhaps the most interesting monument is that of Lord Nelson, near the city hall, erected in 1809.

Commerce and Industries.—Montreal is the natural centre of ocean traffic for a great portion of the continent; it is 288 miles nearer Liverpool than New York is, and Chicago by this route is 368 miles nearer Liverpool. In 1900, 731 sea-going ships arrived in port with an entire tonnage of 1,400,881; value of merchandise exported, \$65,344,197; imported, \$68,550,993; custom duties collected, \$9,001,586. The season of navigation extends from May till November. The most important manufactures and industrial occupations embrace boots and shoes, sugar-refining, cottons, silk, rubber, ready-made clothing, paper, paints, soaps, cements. The Lachine Canal supplies valuable water-power, and on it are saw-mills, sash factories, rolling-mills, nail-works, engine and machine works. There are five establishments for making sewing-machines. The edged tools, axes, etc., of Montreal make are celebrated for their excellence. There are also carpet factories, rope-works, large binderies, and printing-offices. Over 2,500 hands are employed in the tobacco factories; the manufactures of boots and shoes employ over 3,000 hands. Montreal is an important banking centre, the oldest and largest bank being the Bank of Montreal, founded in 1817, with a capital at the present time of \$12,000,000, a reserve fund of \$7,000,000, and assets of \$93,752,000.

Communications.—In 1853 vessels drawing over 11 feet of water could not come up to the harbor, but by dredging a navigable channel of 27½ feet has been obtained. The harbor accommodation is excellent, and has been so improved that Montreal possesses one of the finest harbors in America. Immediately above the city are rapids which obstruct the navigation of the St. Lawrence, but are surmounted by the Lachine Canal, 9 miles long and 22 feet deep, running from Montreal harbor to Lachine. Montreal is the Canadian headquarters of a number of the principal steamship lines, including the Allan line, Dominion line, Beaver line, Donaldson line, etc. The head office of the Canadian Pacific Railway is also here, and this railway and the Grand Trunk both have fine stations and commodious workshops. Several other railways run into the city.

Administration.—Civil affairs are controlled by a city council composed of a mayor and 34 aldermen elected for two years by the votes of all taxpayers. The city is divided into 17 wards, or subdivisions of wards, each represented by two aldermen. The revenue in 1900 was \$3,157,614; expenditures, \$3,095,821; consolidated debt, \$27,000,000. The principal source of revenue is a tax of 1 per cent on the assessed value of real estate for municipal purposes and of quarter of 1 per cent for school purposes.

Nearly half the revenue is spent for interest on debt and schools.

The topography of Montreal has facilitated the construction of a fine system of waterworks deficient only in the matter of filtration; the main reservoir with a capacity of 36,500,000 gallons being situated 200 feet above the level of the river and a high level reservoir 210 feet higher affording a high pressure service available for fire protection to the highest buildings in the city. The supply is obtained from the Ottawa River.

Education.—As a seat of learning Montreal occupies a high place; its chief educational institutions are enumerated in the paragraph on *Public Buildings, etc.* The public schools of Montreal are controlled by boards of Roman Catholic and Protestant School Commissioners respectively, who are appointed partly by the provincial government and partly by the city council. The common schools and high schools are supported partly by a school tax on real estate. No child is debarred from education through not being able to pay fees.

History.—Ville Marie, afterward called Montreal, was founded by Maisonneuve 18 May 1642 during the French régime in Canada. The site had previously been visited in 1555 by Jacques Cartier, who founded there a large Indian town called Hochelaga; and in 1603 by Champlain, when it was found that the Indian town had completely disappeared. The name Hochelaga still survives in the name of one of the municipalities recently annexed to Montreal and in that of an adjacent county. The early French settlers had much trouble with the Indians, culminating August 1689 in the massacre at Lachine, 9 miles from Montreal, of 200 settlers and the capture of 200 more by a band of 1,500 Iroquois Indians. On 8 Sept. 1760 Montreal capitulated to General Amherst and the surrender of the city completed the conquest of New France by the English. In 1775 Montreal was captured by the Americans, who sent expeditions under Montgomery and Arnold to capture Quebec and Montreal; and General Carleton in command of the British forces at Montreal had to retreat to Quebec, where the Americans were ultimately defeated. In 1775 the American General Wooster made his headquarters in the Château de Ramezay, which still stands opposite the city-hall and which was the official residence of the British governors after the conquest. In this same chateau, the Commissioners of Congress, Benjamin Franklin, Samuel Chase, and Charles Carroll, in 1776 met and held council under Gen. Benedict Arnold. In 1776 the American forces retreated. Montreal obtained its first city charter in 1833, the first mayor being Jacques Viger. In 1844 the city became the capital of the province of Canada formed in 1841, by the union of the provinces of Upper and Lower Canada, but Parliament met for the last time in Montreal in 1849; when a mob of English-speaking citizens, enraged at the passing of the "Rebellion Losses Bill," burned down the Parliament Buildings and pelted the Governor-General, Lord Elgin. The fire (which destroyed valuable public records, the parliamentary library, and in fact everything appertaining to Parliament but the mace and the portrait of Queen Victoria), terminated Montreal's brief career as the seat of

DOMINION SQUARE, MONTREAL.

MONTREAL — MONTSERRAT

government. The recent history of the city has been an almost unbroken record of commercial and industrial progress. Great impetus was given to its growth by the opening of the Canadian Pacific Railway, the first train on which left Montreal for Vancouver on 28 June 1886. Pop. (1901) city proper, 266,826; including suburbs, 332,544.

Montreal, Canada, an island at the confluence of the Ottawa and the Saint Lawrence rivers, with the city of Montreal (q.v.), on the southeast shore. The island is 32 miles long, 10½ miles broad, and in Mount Royal rises 735 feet above river-level; the surface, however, is generally level, fertile, and well cultivated. Area, 197 square miles.

Montres'or, Frances Fredrica, English novelist: b. near Walmer, Kent. She is a daughter of Admiral Montresor, and among her books, which have had a vogue in this country as well as in England, are: 'Into the Highways and Hedges' (1895); 'The One Who Looked On' (1895); 'Worth While' (1896); 'False Coin or True' (1896); 'At the Cross Roads' (1897); 'The Alien' (1901).

Montrose, mōn-trōz', James Graham, MARQUIS OF, Scotch royalist general: b. 1612; d. Edinburgh 21 May 1650. He was son of the Earl of Montrose, whom he succeeded in that title in 1626. He was educated at St. Andrew's; joined the opposition to Charles I.'s attempt to introduce episcopacy into Scotland in 1637, becoming one of the leaders of the Covenant; but soon made peace with the king in the hope that neither Episcopacy nor Presbyterianism would be given sole power in Scotland, but that the crown and the nobles might rule. This programme, however, was opposed by Argyll, who had Montrose imprisoned in Edinburgh Castle in 1641. On the beginning of the Civil War Montrose repeated the offer of his services to Charles; they were accepted in 1644, when with only 1,000 men he invaded Scotland, and, after being deserted by practically all his followers, planned a rising of the Highland clans. These he united by their common hatred of Argyll, and with them he won several victories, only to be crushed at Philiphaugh (12 September) by David Leslie. Montrose escaped to Norway. In 1649 he succeeded in urging the younger Charles to send him again to Scotland; but the clans would not rise. He was captured, taken to Edinburgh, and there drawn and quartered. His loyalty to the Stuart cause is only less remarkable than his own scheme of Scottish independence of ecclesiastical control, an ideal to which he always remained faithful. Montrose was a political poet, whose verse is vigorous. As a general he ranks first among the Scottish royalists. Consult: Napier, 'Montrose and the Covenanters' (1838), and Gardiner, 'The Great Civil War,' Vol. II., which is particularly able in its criticism of Montrose's strategy.

Montrose, Colo., town, county-seat of Montrose County; on the Uncompahgre River, and on two branches of the Denver & Rio Grande railroad; about 355 miles southwest of Denver. It is in the Uncompahgre Valley, in which there is a large acreage of fertile soil, which is made productive by irrigation. The chief products are fruit, grains, and vegetables.

Considerable attention is given to stock-raising. Pop. (1890) 1,330; (1900) 1,217.

Montrose, Pa., borough, county-seat of Susquehanna County; on the Montrose, the Lehigh V., and the Delaware, L. & W. R.R.'s; about 40 miles north by west of Scranton. It is about 2,000 feet above the sea, and its cool climate in summer and the beauty of its scenery make it a favorite summer resort. The manufacturing are machine shops, lumber mills, flour mills, and creameries. Pop. (1890) 1,735; (1900) 1,827.

Montrose, Scotland, a seaport town and royal burgh in Forfarshire, 80 miles northeast of Edinburgh, at the mouth of the South Esk, which widens out into a shallow expanse behind the town, known as Montrose Basin. The river is crossed by a suspension bridge, and by a railway bridge. Between the town and the sea are extensive "links." Montrose is well built and has the usual public buildings and institutions, including two public libraries (one with 19,000 vols.) and one of the largest parish churches in Scotland. The principal employment is flax-spinning, employing about 2,000 hands. Ship-building is also carried on, and there are extensive saw-mills. The foreign trade, which is largely in timber, flax, etc., is chiefly with the Baltic and Canada. Montrose is also the centre of a fishery-district. It dates prior to the 12th century and is one of the Montrose district of burghs, which includes Arbroath, Brechin, Forfar, and Bervie. Pop. (1901) 12,401.

Monts, Pierre du Guast, pē-ār dü gā mōn, French colonist in North America: b. Saintonge, France, about 1560; d. Paris 1611. He was of an Italian family and educated in the Roman Catholic faith, but became a Protestant and a member of the court of Henry IV., who in 1603 appointed him lieutenant-general with viceregal authority of a company of colonists to whom Acadia had been granted. He sailed from Havre in 1604 with Samuel Champlain and the colonists, and after exploring the Bay of Fundy discovered Annapolis harbor and then explored and named St. John River. He established a colony at St. Croix and at Port Royal and then returned to France, but received no recognition of his services. At his own expense he sent relief to his colonists and assisted Champlain and Pontgrave to make a voyage to the St. Lawrence in 1607; and Quebec was founded by explorers aided by him in 1608. He lost favor at court upon the death of Henry IV., and died a year later. Consult Parkman, 'Pioneers of the New World' (1865).

Montserrat, mōnt-sēr-rāt', Spain, a mountain in the province of Catalonia, 24 miles southwest of Barcelona, famous for its ancient Benedictine monastery, composed, in part, of 13 hermitages, accessible only by steps hewn out of the steep rock, and founded by Sifredo el Velasco, count of Barcelona, on the spot where a miracle-working image of the Virgin Mary was found in the 9th century. It was enlarged and richly endowed by Philip II. Learned Benedictines had established themselves here as early as 976; and they and their successors formed a large library, which was destroyed when the monastery was pillaged by the French and partly destroyed in 1811. After the restoration of Fer-

MONTserrat — MONUMENTS

dinand VII. the rebuilding of the monastery was begun, but was stopped again when the monks were expelled by the Carlists in 1827. The monastery has fallen more and more into decay since the abolition of the order to which it belonged. While living in this monastery Ignatius of Loyola (q.v.) conceived the idea of founding the order of Jesuits.

Montserrat, *mönt-së-rät'*, West Indies, a British island of the Leeward group, almost at the same distance (about 30 miles) from the islands of Nevis, Antigua, and Guadeloupe. It is 32 square miles in extent, nearly two thirds of which is mountainous and barren. Its culminating point is the Soufrière, a volcano 3,000 feet high. The climate is on the whole healthful. The principal exports are sugar, molasses, tamarinds, and lime-juice; and the principal imports, cottons and clothing materials, hardware and other manufactures. The exports and imports are usually from £25,000 to £30,000 each annually. The government of the island is vested in the governor-in-chief of the Leeward Islands, who is represented by a president, assisted by a council and house of assembly. Plymouth, the capital, is on the southwest side of the island. The island was discovered by Columbus, and was colonized by the British in 1632. It was twice in the hands of the French, but since 1783 has been uninterruptedly possessed by the British. Pop. (1901) 12,215, of whom not more than 200 are whites.

Montt, *mönt*, **Jorge**, Chilean sailor and politician: b. Santiago, Chile, 1846. He was a son of the Chilean statesman Manuel Montt (q.v.) and early entered the navy, where he had gained the rank of captain when in 1890 an uprising against President Balmaceda was threatened. When the revolution broke out in 1891 Montt was given command of the naval and land forces subject to the control of Congress, and after the suicide of President Balmaceda was appointed provisional president and in November 1891 was elected to the office.

Montt, **Manuel**, Chilean statesman: b. Petorca, Chile, 5 Sept. 1809; d. Santiago, Chile, 20 Sept. 1880. He was graduated from the National Institute in Santiago and was engaged as instructor there until he entered upon his political career. As assistant secretary of state he sternly suppressed the revolt of 1837, and in 1838 was made a judge of the supreme court. His election to the chamber of deputies followed and he was for a time president of that body. He was minister of justice 1841-5 and of the interior 1846-8, was elected president in 1851 and under his firm, conservative policy a succession of revolts were crushed and many industrial improvements were introduced. After the expiration of his second term he resigned his office to his successor and assumed the presidency of the supreme court. He was president of the American congress which met in Lima in 1865.

Montyon (*môn-të-ôn*) **Prizes**, rewards from a fund left in charge of the French Academy by Jean Baptiste Robert Auger, Baron de Montyon (b. 1733; d. 1820), a French economist and philanthropist, and a friend of Franklin. He founded in his lifetime six prizes, of which two, that for useful discoveries in the arts, and that for valuable medical discoveries, lapsed after his death. The others are: (1) a prize,

founded in 1782, granted annually to the author of a literary work adjudged the most beneficial to the temporal good of mankind; (2) founded in the same year, for the most important discovery making more healthful the occupations of workmen; (3), founded in 1783, to promote mechanical research; and (4) a prize, first given in 1783, for the most remarkable virtuous act on the part of any poor French citizen. For each of these prizes he left a capital fund of 10,000 francs (\$2,000).

Monumen'ta Germā'nīæ Histor'ica, a great historical work dealing with the monuments and antiquities of Germany, the first volume of which was published in 1826. It was begun in 1819, and later was placed under the direction of the Prussian Academy of Sciences. In 1902 upward of 70 volumes had been issued.

Monuments. The term monument is applied to structures which are characteristic or remarkable on account of their being erected as memorials, and also, though loosely, to those buildings which express some form of worship, or have peculiar prominence on account of their beauty, proportion, or grandeur. In modern times, churches are often erected as memorials to individuals, and yet the term monument is not applied to them except in the vague general sense named above. It is evident, therefore, that such buildings may be commemorative monuments, as well as columns or tombs. Sepulchral monuments are the memorials most commonly erected. In Egypt, pyramids are monumental on account of their size, showing very little of so-called architectural art. There are about 100 of these, each containing a room which was used as a royal sepulchre. The Great Pyramid built by Khu-fu, called by the Greeks, Cheops, about 950 B.C., measures 764 feet square at its base, and is 482 feet high. As Saint Peter's, at Rome, is about 15 feet less in height, it could be covered by the shell of this pyramid. In Assyria and Chaldaea there are few temples and no tombs remaining of sufficient architectural importance to be classed as monuments. Important buildings in these countries were placed on huge mounds or terraces of earth, which raised them above the surrounding country, but as these structures were mainly of unburned bricks, they have fallen into shapeless mounds.

The earliest existing Greek monuments are found at Mycenæ and Tiryns. The Lion Gate at Mycenæ shows two large lions rampant on each side of a column, carved in bas-relief above the lintel; and this sculpture is wholly monumental in character, related both to religious and dynastic associations. The gateway at Mycenæ is one of the earliest of porches or towers of entrance which were among the chief monuments of Greek art: these were the Propylæa of which the most important was that of the Acropolis of Athens, with the small Ionic temple of Nike Apteros close by. The choragic monument erected by Lysicrates to commemorate his choral victory may still be seen at Athens. This was built at the time of Alexander's conquest, when Athens was declining and Asia Minor was being filled with magnificent temples of the Corinthian order. Other choragic monuments still exist at Athens in a partly ruined condition. The Tower of Winds, or Clepsydra of Andronicus,

was erected at Athens about 100 B.C., but this was rather a utilitarian structure, as it served as a measure of time. Other Greek monuments were the Arch of Hadrian, of the later Roman period; entrances to other temple sites, similar to the Propylæa of the Acropolis, as that of Eleusis; theatres, colonnades, stadia, and gymnasia. Greek tombs that remain at the present time are nearly all to be found in Asia Minor, the best known being the Mausoleum at Halicarnassus. The small Greek monuments and tombstones are very simple and refined in detail. Of the same epoch are the rock-cut tombs of Asia Minor. Some of these are of great beauty, the exterior face of the living rock having been smoothed and made vertical, and adorned with magnificent bas-reliefs of very large size.

The principal Roman monuments were on a large scale, the rough work being executed by cheap labor, soldiers, barbarians, or slaves. The Roman Forum was crowded with temples, arches, and individual memorials. Arches were characteristic products of Roman civilization, and were generally erected in honor of some victorious general or in commemoration of some great event. (See ARCH, MEMORIAL AND TRIUMPHAL.)

Columns were also frequently erected. The column of Trajan is still standing in Rome. It is 133 feet high, and has a spiral line of figures in relief from the foot to the top of the shaft, showing the story of one of Trajan's campaigns. There is a staircase within the column leading to the top. The sepulchral monuments of the Romans were generally small. One of the larger ones was the circular tomb of Hadrian, now the castle of San Angelo. Small sepulchral monuments lined the sides of Roman roads for miles outside the city. Many have been found at Pompeii. The tomb of Cæcilia Metella, a characteristic example, was built by Crassus, about 60 B.C. It was circular in plan, with a square base.

Early Christian architecture, developing after the fall of Rome, used or copied Roman buildings. At Ravenna interesting monuments of this period were the tomb of Galla Placidia, built in the middle of the 5th century, and the tomb of Theodoric, erected early in the 6th century, a two-storied structure, roofed by a single stone 36 feet in diameter. Basilicas commemorating scenes in the life of Christ were erected as early as the 4th century in Syria, at Bethlehem, at the sepulchre near Jerusalem, and on the site of the temple.

The principal monumental buildings of the Byzantine period were in Syria, where from the 4th to the 8th century what we call Syrian architecture was in full luxuriance. The noble tombs of cut stone are, together with the churches and villas built of the same material, rather Græco-Syrian than strictly Byzantine in construction and design. Romanesque architecture in western Europe has not left us many monuments of great size and importance, but some tombs of great beauty remain in the churches of England, France, and Germany.

Prominent monuments of the Gothic period were erected in the cathedrals at Paris, Chartres, Rouen, Amiens, Rheims, and in the Sainte Chapelle, Paris. In England, early English Gothic is well shown in the crowd of altartombs, some of them with canopies, which are

found in the churches, especially in Westminster Abbey. Memorial chapels were also built of great richness and splendor. A good example of the decorative period is to be found in Henry VII.'s chapel at Westminster. Italian Gothic monuments include many of the wall-tombs in the cathedrals at Florence, Sienna, and Milan.

The Renaissance is represented by the Florentine wall-tombs of Santa Croce and the Venetian ones of the churches of Saints Giovanni e Paolo, the Frari, and many others. The principal monument of Saracenic architecture in India is the Taj Mahal in India, built in the middle of the 16th century, but the tomb-mosques of the caliphs near Cairo are equally fine as architecture, however inferior in cost and splendor.

In the 19th century, a list of monuments should certainly include the triumphal arches of the French empire, the arch of the Carrousel, and the Arc de l'Étoile, the Pantheon, the Madeleine, the Colonne Juillet; in America, the tomb of General Grant in New York, the many Lincoln and Washington monuments in different cities, and a host of statues, some equestrian, for which see SCULPTURE.

FRANK A. BOURNE,
Architect, Boston, Mass.

Monvel, Louis Maurice Boutet de, lōō-ē mō-rēs boo-tā dē mōn-vêl, French painter and illustrator: b. Orleans 1850. He studied with Rudder, Cabanal, and Carolus Duran, with the last, after some work in the Atelier Julien. His first picture exhibited in the Salon appeared in 1874. When his success as a painter seemed assured and many medals had been awarded to his works, he turned his attention to illustration and soon developed an original style of unique attractiveness. While his drawing is flawless and full of beauty, he prefers the decorative to the realistic effect in color and modeling. He is happy in delineating children, and in this respect he is Kate Greenaway subtilized into academic delicacy, strength, and variety. The illustrations which he made for the 'Life of Jeanne d'Arc' (1897) in the 'Century Magazine' are supremely successful both in line and color. In the Memorial Church at Domrémy he has painted six panels illustrating the career of La Pucelle. Among his best known pictures is 'The Apotheosis' (1885), and his portraits are famous.

MONZA — MOODY

Monza, mōn'zā, Italy, a town of Lombardy, in the province of Milan, 11 miles by rail northeast of Milan, on the Lambro. The town is of great antiquity, and has a quiet, venerable air. The most remarkable edifice is the cathedral of St. John the Baptist, originally founded at the end of the 6th century by the celebrated Lombard queen, Theodelinde, but subsequently renovated and enlarged. It contains the ancient iron crown of Lombardy, restored to the Italians by Austria in October 1866, as well as various other relics and some valuable art treasures. There is also an old imperial palace surrounded by a large and well-laid-out park. Here, while on a visit, King Humbert of Italy was assassinated 29 July 1900. There are manufactures of silk, hats, leather, bricks, tiles, and sausages, for which the town has long been famous. Pop. (1901) 42,599.

Mon'zonite, an augite variety of syenite (q.v.).

Moody, Dwight Lyman, American evangelist: b. Northfield, Mass., 5 Jan. 1837; d. there 22 Dec. 1899. He worked for a time on a farm, then went to Boston as a salesman in a shoe store, and while there became a member of a Congregational church. He later obtained a position in a shoe store in Chicago, and there began his active religious work in the Sunday school by forming a class of poor boys; from this beginning he built up a large Sunday school, and after 1860 devoted himself entirely to religious work. During the Civil War he worked among the soldiers, in the employ of the Christian Commission, and at the close of the War resumed his mission work in Chicago, becoming president of the Young Men's Christian Association in 1865. A large church was built for his work, of which he became pastor, though never regularly ordained. In 1870 he was joined by Ira D. Sankey, the singer, and in 1873 the two visited England and Scotland, doing evangelistic work. On their return large meetings were held in New York, Brooklyn, and Philadelphia, and subsequently in many cities throughout the United States, at which it is estimated Mr. Moody addressed over 50,000,000 people. Without abandoning entirely his evangelistic tours, he made Northfield his headquarters and established there a girls' academy (1879) and a training school for religious workers, and at Mount Hermon a boys' academy. Later he founded a school for Bible study in Chicago; and inaugurated the custom of holding, at Northfield, summer conferences of college students and missionary volunteers, and the annual meetings of the Young Men's and Young Women's Christian associations. He also established systematic preaching and distribution of religious literature among inmates of the prisons; and built up at Chicago and Northfield establishments for the publishing of inexpensive religious books, tracts, etc. His marked executive ability won him the confidence of men of wealth, who gave generously to his enterprises. Though a Bible student, he was not a theologian and did not understand the methods of Higher Criticism; he was primarily a preacher of the Word of God as he believed it. The power of his preaching was due to his strong personality, his simplicity of thought and language, and his thorough sincerity and earnestness. He published:

'How to Study the Bible'; 'Men of the Bible'; 'Weighed and Wanting'; 'Arrows and Anecdotes' (1877); 'The Way and the Word' (1877); 'Heaven' (1880); 'Secret Power' (1881); 'The Way to God' (1884); and 'Bible Characters' (1888).

Consult: Drummond, 'Impressions of Dwight L. Moody'; Hartzler, 'Moody in Chicago'; W. L. Moody, 'Life of D. L. Moody' (1900); and P. D. Moody and A. P. Fitt, 'Shorter Life of D. L. Moody.'

Moody, Helen Watterson, American author: b. Cleveland, Ohio. She was graduated from the University of Wooster, Ohio, in 1883, and was instructor in English and Latin there in 1883-7, when she became a member of the editorial staff of the *New York Sun*. She was married to W. S. Moody, a New York journalist, in 1891. She has published: 'The Unquiet Sex' (1898); 'A Child's Letters to Her Husband' (1903); etc.

Moody, James, American soldier: b. New Jersey 1744; d. Sissibon, Nova Scotia, 3 April 1809. He was a New Jersey farmer at the outbreak of the American Revolution, but with 73 of his neighbors joined the British forces and was active in attacks upon his former friends. He was daring and unscrupulous in his movements, and succeeded, in 1781, in seizing important despatches of Washington's. Though unsuccessful in many instances, his knowledge of the country enabled him to make his escape after his expeditions as a spy, and his name was regarded with fear in the region in which he worked. He retired to Canada after the war, where he was presented with an estate and received half-pay as colonel of the militia during the remainder of his life.

Moody, William Henry, American lawyer and politician: b. Newbury, Mass., 23 Dec. 1853. He was graduated from Harvard in 1876; studied law, and began the practice of his profession in Haverhill, Mass. He quickly attained success as a lawyer, was city solicitor for a time, and from 1890 to '95, district attorney for the eastern district of Massachusetts. In this position he showed himself an active, fearless prosecuting officer, notably in the case of certain aldermen of the city of Lawrence whom he convicted of receiving bribes and brought to punishment; he was also associated with the Massachusetts attorney-general as prosecuting attorney in the trial of Lizzie Borden for the murder of her parents. In 1895 he was unanimously nominated for Congress by the Republicans, to fill a vacancy; he was elected at that time, and also to the three succeeding Congresses. Through close study of the rules of the House he became distinguished as a parliamentarian, and was suggested as a possible candidate for Speaker; he was a most active and efficient member of the committee on appropriations, and regularly had charge of the Sundry Civil Appropriations Bill, which he examined in detail; he was also appointed to the committee on insular affairs, and through his work on both these committees gained special knowledge of naval matters. In 1902 he was appointed secretary of the navy to succeed John D. Long (q.v.), and in his administration has supported the policy of increasing the size and efficiency of the navy.

MOODY—MOON

Moody, William Vaughn, American poet: b. Spencer, Ind., 3 July 1869. He was graduated from Harvard in 1893, where he was for a time an instructor in English, and is now an instructor in English literature in the University of Chicago. He has published 'The Masque of Judgment,' a lyrical drama (1900); 'Poems' (1901); and, with R. R. Lovett, a 'History of English Literature' (1902). His verse is well wrought, not infrequently rising to a sustained high level as his 'Ode in Time of Hesitation.'

Moon, William, English philanthropist: b. Horsemonden, Kent, 1818; d. England, 1894. He was educated for the Church but was compelled to abandon this career upon becoming totally blind. He devoted his life to establishing schools and educational helps for blind children and invented a new and simple system of embossed letters for the use of the blind. He established libraries of his books in Europe and United States and greatly furthered the facilities for home instruction. Consult Rutherford, 'William Moon and His Work for the Blind' (1898).

Moon, The, from the earliest times, has been the chief object in the sky to attract the attention of the human race. The continual change in its appearance from day to day, its value as a light giver at night, the apparent irregularity of its motions, the curious markings on its face, its connection with the ebb and flow of the ocean, and many a real or supposed influence in terrestrial affairs, have always caused it to be a subject of speculation and inquiry among philosophers of every age. Yet it is only within the last 300 years that the various theories and superstitions connected with it have been put to the test, and that order has been evolved from the chaos of fact and fancy. Even at the present time many a belief, tested by science and found wanting, finds support in otherwise enlightened communities.

Size, Weight, etc.—The moon is a nearly spherical body with a diameter of 2,163 miles, a little more than a quarter of that of the earth, moving at an average distance from the earth of 239,000 miles. Its surface is therefore $\frac{1}{3}$ and its volume $\frac{1}{80}$ that of the earth. It is, however, less dense in the ratio of 10 to 16, or, on the average, its density is the same as that of the rocks on the earth's surface, so that it would require the materials contained in 81 moons to form our globe. Its smaller size and mass cause gravity at the surface to be only $\frac{1}{6}$ of the terrestrial attraction: the same exertion which would lift a given weight here would raise a weight six times as great there, and a body, instead of falling 16 feet in the first second, would fall only $2\frac{2}{3}$ feet. It moves so as to always turn the same face to the earth and therefore rotates on its axis in the same time that it takes to go round the earth—about 27 days. The rotation of the moon about its axis but its motion round the earth is neither quite uniform or circular, as will be seen later; consequently extra portions of the eastern and western faces come successively into view. Further, the moon's axis is not quite perpendicular to the plane of its orbit, so that the north and south caps are in turn a little inclined toward the earth. These motions are called the librations of the moon, and they permit us to see rather more than half (about three fifths) the surface.

Light and Atmosphere.—Like the earth, the

moon possesses no light of its own, but receives all from the sun, and its day—the interval from sunrise to sunrise—is a month. At full moon it sends to us about one 600,000th part of that given by the midday sun. The surface is not nearly so white as its concentrated light would seem to indicate; its brightest portions are nearly of the shade of salt and its darkest that of slate, the average being the color of gray weathered sandstone. The long sunshine for two weeks and the absence of sun for the following two weeks must cause immense variations of temperature. But Professor Langley of Washington estimates that the temperature of the surface, even at the hottest, probably never rises above the freezing point of water; the heat is radiated out nearly as fast as it is received. In the long night the temperature must fall to something like 200° below zero. In spite of this small amount of heat, Professor Langley, by inventing a very sensitive instrument called a bolometer which would detect the heat from a candle a mile away, succeeded in detecting heat rays coming from the moon. His results depend partly on the many fruitless attempts which have been made to find evidences of the existence of an atmosphere. If air is present its pressure cannot exceed 1-750 that at the earth's surface and it is probably much less, as no refraction has ever been observed when the moon's limb passes over a star. A similar argument applies to the existence of water in any quantity, and no clouds have been certainly seen. It is possible that water—probably in the form of ice—may exist at the bottom of some of the deeper craters, but the low temperature would scarcely permit it to be liquified even when the sun was shining full on it.

Surface Marks.—The well known resemblance of the full moon to a human face disappears almost immediately if a glass—even the smallest opera glass—is turned on to it. When it is looked at through a moderately large telescope, the surface is seen to be broken up into mountain ranges and valleys as well as darker portions, which seem to be comparatively flat. A closer inspection made at more favorable times when the moon is not full so that the shadows cast by the sun can be well seen, puts these features clearly into view. The magnificent telescope in the Lick Observatory in California brings the satellite so near that objects which might be seen with the naked eye if the moon were only 100 miles distant, can be distinguished on the surface under favorable circumstances.

Craters.—The most marked feature of the lunar surface is the number of craters which appear in almost every region. These are circular rings with diameters ranging from half a mile to 100 miles, and with exterior walls sometimes as high as 20,000 feet—formations comparatively rare on the earth's surface where they seldom exceed a diameter of a very few miles with much lower walls. In some parts they are scattered in the wildest profusion, overlapping one another, smaller ones breaking into the walls of the larger and so crowded together that it is difficult to distinguish one from another. In many cases there is a central cone or a group of peaks which often rise as high as the walls of the ring and on which small craters can sometimes be seen. There are also lofty ranges of mountains ten to fifteen thou-

MOON

sand feet high, some peaks of the Lunar Apennines rising to 20,000 feet.

Seas.—The so-called seas of the moon are simply portions of the surface darker in color than the average and very much less broken up by craters or mountain ranges. These form the main features of the face seen at full moon. They are crossed by thin lines known as rills or clefts which run in all directions, sometimes straight and unbroken for hundreds of miles, even intersecting ranges of mountains and craters and reappearing on the other side. These rills are generally 2 and rarely exceed 10 miles in width, their depth varying from 100 yards up. A curious feature of a different kind is an absolutely straight cut—the great Alpine valley—some 83 miles long, which crosses a range of mountains and under low magnification looks as if some wandering celestial body had grazed the surface.

White Rays.—The most puzzling feature of the surface consists in a series of white rays or streaks which radiate from a few of the principal craters in every direction. In their brightness they mask all other shades of tint on the surface and seem to continue their course, sometimes for hundreds of miles, quite independently of the nature of the country they cross. Prof. W. H. Pickering, however, who has studied the systems carefully, considers that their actual length has been much exaggerated and believes that the apparent length is due to lines of small craters from which they emerge. The most remarkable system is that starting from the crater Tycho, itself of a brilliant whiteness, and giving the whole region the appearance of a globe cracked by internal pressure—a suggestion made by Nasmyth who actually cracked a glass globe in this way and obtained a striking resemblance.

Origin of the Formations.—The origin of these various formations has been the object of much speculation. That the craters and mountain ranges came into existence after the cooling down of the outer crust and were produced by its contraction and by the enormous tidal disturbances caused by the earth seems a sufficiently probable hypothesis. Objection has been raised to this view on account of the fact that terrestrial volcanoes all show the presence of large quantities of water and that the earth has comparatively few of such formations. But weathering action has undoubtedly had little effect on the moon's surface, while it has been a powerful factor in eliminating such features on the earth. Another theory, that the craters are of the nature of cracked bubbles like those which appear in cooling slag which contains gases, does not require the presence of water, but it has not met with any general acceptance. The rills or clefts are unexplained; some astronomers incline to the idea that they are dried watercourses, others with greater probability that they are fissures produced in cooling. The white streaks or rays are considered by Messieurs Loewy and Puiseux, whose work on the moon accompanies a big atlas of photographs taken lately at Paris, to be formed of volcanic dust or cinders shot out from the craters and carried for considerable distances by currents of air before being deposited on the ground. Professor W. H. Pickering inclines to the same theory. The rays were the last evidences of activity before the body of the moon became cold

and absorbed the small quantities of air and water which at one time were present outside.

Surface Changes.—The evidence as to changes in the moon's surface since the first careful observations were made—about a century ago—is doubtful. One crater, Linné, observed by Beer and Mädler, is given as having a diameter of about six miles. At various times it seems to have appeared and disappeared again—possibly owing to the different circumstances under which it was seen; at present it is scarcely visible. In the absence of air and water such changes must be very rare, the weathering action which takes place on the earth having little or no effect; possibly the enormous differences of temperature every two weeks may in time cause a breaking up of the rock.

Photographs.—The photography of the moon's surface was started by Draper and Bond in America about the middle of the 19th century. The pictures of the latter were shown at the London Exhibition in 1851 and inspired De la Rue in England and others as to its possibilities for the accurate investigation of the lunar surface. The magnificent photographs of Rutherford made in New York and published in 1873 have only recently been surpassed by those taken at the Lick, Yerkes and Paris observatories. It is possible that photographs taken 20 or more years from now may, on comparison with these, enable astronomers to detect changes if such occur. The varying aspects of the moon will make this difficult, but the personal element, always present when drawings have to be made, will at any rate be eliminated. At the same time the eye can detect minute details which are absent from photographs.

Periods.—The average time occupied by the moon, in moving in its orbit round the earth, is 27d. 7h. 43m., its sidereal period. The synodic period is the interval between successive new moons and it is a little longer owing to the time, $365\frac{1}{4}$ days, occupied by the earth in moving round the sun. The moon performs $1/27\frac{1}{3}$ of its orbit and the earth $1/365\frac{1}{4}$ each day, and therefore the difference between these $1/27\frac{1}{3} - 1/365\frac{1}{4} = 1/29\frac{1}{2}$ is the daily fraction of its path which the moon describes with respect to the sun; that is, $29\frac{1}{2}$ days (29d. 12h. 44m.) is the synodic period. If the plane of the moon's orbit coincided with that of the earth's equator, the moon would rise about 50 minutes later each day, but the inclination of these planes to one another varies between 18° and $29\frac{1}{2}^\circ$, so that this retardation is quite different at different times. When full moon occurs near the autumnal equinox, it may, in the latitude of New York, be as small as 23 minutes, while further north it may reduce to nothing, so that for several nights the full moon rises about the same time, soon after sunset. The feature is known as the harvest moon and in countries where the autumn weather is very uncertain, it is a valuable help to the farmers, furnishing them with light to get in their crops after the setting of the sun. The hunter's moon is the next full moon after the harvest moon; the same phenomenon, less marked, occurs. The anomalistic month, a little over $27\frac{1}{2}$ days, is the interval between the times when the moon is in its perigee, that is, when it is nearest to the earth.

Moon's Path.—The shape of the moon's path is approximately an ellipse whose two axes are nearly of equal length, but an

MOON

ellipse will only represent its orbit for a very short time. In order to give an idea of its complicated motions, a model, on a scale of 1:125,000,000, can be constructed as follows: The first part, to represent the motion of the earth, consists of a rail on raised supports (which are movable) in the shape of an ellipse whose semi-axes are respectively 390 feet 10 inches and 390 feet 3 inches long and whose plane we shall for convenience take to be horizontal. The earth is represented by a carriage moving on this rail and the sun by a ball placed on the longest diameter, distance 6 feet, 7 inches from the centre of the ellipse. A straight bar two feet long is attached to the carriage by a ball and socket joint at a point $\frac{3}{8}$ inch from the centre of the bar. The bar forms the longest diameter of an elastic tube in the shape of an ellipse and the tube is so attached to the bar that it may change its size and shape slightly. The plane of the tube is to be inclined about 5° to the horizontal. A bead sliding freely within the tube represents the moon.

Motion.—Now let the carriage run along the rail not quite uniformly but so that its angular velocity about the ball representing the sun varies inversely as the square of its distance from the ball, and it makes it a complete circuit once in $365\frac{1}{4}$ days. At the same time the plane of the tube attached to the carriage is to turn round slowly in the opposite direction, so that the horizontal line in it (that formed by the intersection of the plane of the tube with the horizontal plane and called the line of nodes) will describe a circuit once in $18\frac{3}{4}$ years; the inclination of the tube is to oscillate not more than $5'$ on either side of the mean inclination of $5^\circ 8'$ to the horizontal. With these motions, the bar carrying the tube is to slowly turn round in its own plane in a forward direction so as to complete a circuit once in about 9 years, and the tube is to slightly change its shape and size to and fro as it moves. Finally, the bead representing the moon moves according to the same law and in the same direction as the carriage, that is, not quite uniformly, but so that its angular velocity about the joint varies inversely as the square of its distance from the joint; its circuit in the tube is completed once in 27.5546 days—the anomalistic period. These various motions, complicated as they are, only give a general idea of the way in which the moon moves, but the model is sufficient to explain most of the phenomena connected with the moon's motion. All the parts are in a state of oscillation about their average positions, the periods varying from a few days to many thousand years. Even the plane, size, shape, and position of the rail are not quite constant but vary slowly from year to year. The attempt to disentangle even the principal oscillations had become an almost hopeless task until Isaac Newton in the 17th century was able to reduce them all to manifestations of a single law known as the law of gravitation. This law states that every two particles of matter in the solar system attract one another with a force which is proportional directly to the product of the masses and inversely to the square of the distance between them, that is, if either of the masses be doubled, the force is doubled, but if the distance be halved, the force is increased four-fold. From his time mathematicians have been engaged in working out the consequences of this

law. If there are only two particles acting, they describe ellipses about one another, but if more than two act, the motion is so complicated that it taxes the mathematician to the utmost to determine it completely. The moon is attracted mainly by the earth, but it is much disturbed from its elliptic motion round the earth (that in the tube) by the pull of the sun (which mainly causes the motions of the tube), and to a small extent by that of the planets. Up to the last quarter of the 19th century this work was undertaken by European mathematicians, among whom may be mentioned Euler, Laplace, de Pontecoulant, Hansen, Delaunay and Adams: the tables of Hansen, published in London in 1857, are still used, with a few corrections, for the places of the moon in the nautical almanacs of the present day. The greatest advance made during the last 30 years was started by Dr. George William Hill, who was for many years on the staff of the 'American Nautical Almanac' at Washington. His two papers published in 1877 opened a new era in the mathematics of astronomy and especially in that of the moon, and they have formed the basis of nearly all the progress which has since been made in all departments of celestial mechanics. His name, though fully known to astronomers all over the world, is less familiar to the public, on account of the highly mathematical nature of his work. In a different part of the subject, the work of Professor Newcomb is not less valuable, comprising, as it does, difficult and laborious investigations into the sufficiency of Newton's law for the explanation of every detail of the moon's motion, and involving researches into ancient records of eclipses of the sun. A new theory of the moon's motion, leading to the formation of new tables, has now been nearly completed by E. W. Brown on the basis of Dr. Hill's work. Brown has shown that Newton's law of gravitation will account for the motion of the perigee of the moon within $\frac{1}{800000}$ of one per cent.

Secular Acceleration.—In illustration of the great accuracy with which calculations and observations may be compared at the present time may be mentioned what is known as the secular acceleration. Observation shows that at the end of each century the average time of revolution of the moon round the earth is 2 seconds less than it was at the beginning. Newton's law shows that a slight change in the shape of the earth's orbit (that is in the shape of the rail above) due to the attractions of the planets will account for $\frac{3}{4}$ of this amount; the other $\frac{1}{4}$ are still unexplained. This means that astronomers are searching for the cause of a monthly change of less than $\frac{1}{1000}$ of a second in the length of the month.

Phases.—The phases of the moon arise from the combined motion of the earth and moon. To resume our mechanical model, imagine the tube to be transparent and the ball an electric light. When the bead is furthest from the ball, the side of the bead facing the carriage is illuminated and this corresponds to full moon. As the bead moves round the tube a spectator on the carriage sees less and less of the illuminated half; the bead then passes through its third and last quarters until it is at its nearest to the ball and almost invisible. Still progressing, its illuminated half begins to be visible from the other side (new moon) and passing on to its first

MOON

and second quarters its illuminated half is again fully seen.

Eclipses.—An eclipse of the moon takes place whenever the earth gets between the moon and the sun, cutting off the light of the latter from the moon, an eclipse of the sun when the moon gets between the earth and the sun. (See ECLIPSE.) It so happens that the apparent size of the moon as seen from the earth is very nearly equal to that of the sun. Owing to the varying distance of the moon and sun from the earth, sometimes the moon, as seen from a place on the earth, will completely cover the sun for a time which may be as long as 8 minutes, and we have a total eclipse; at other times it fails to cover it and we get a partial eclipse or, if its centre passes across the sun's centre, an annular eclipse. A total or annular eclipse is seen over only a narrow band of the earth's surface. From our mechanical illustration it is evident that an eclipse of the moon can occur only at full moon, and one of the sun just before new moon. If the plane of the tube were horizontal, there would be eclipses of both moon and sun every revolution of the bead, that is, once a month; actually, it is only when the bead is very near the horizontal plane (or near the line of nodes) at the time when it is nearest or furthest from the ball, that the event can take place. A complete cycle of eclipses will evidently occur each time the line of nodes completes a circuit—once in about 18 years. This is known as a lunar cycle and during that period there will be on the average 41 eclipses of the sun and 29 of the moon.

Tides.—Besides the indirect effect of the moon as a light-giver on the earth the most important influence it exerts is that which causes the tides. (See TIDES.) These have in their turn a slight reactionary effect on the motion of the moon as we shall see presently. Some slight traces of lunar effect are also observable in the variations of the earth's magnetism. But the most widespread idea with regard to lunar influence is its supposed connection with the changes in the weather. Many an old saying exists, handed down the ages, giving a rule for prophesying the weather by its condition at certain phases of the moon. Since the time when careful daily records have been kept of the temperature, height of the barometer, rainfall, etc., science has been employed in examining whether any kind of period can be traced in them and especially periods connected with the moon's changes. Little positive success has attended these efforts, but there is plenty of negative evidence. Every attempt to connect a periodical change in the weather with one in the moon's motion has resulted in failure. Undoubtedly some slight connection of a tidal nature must exist, but it is very small and is entirely masked by variations of the weather due to unknown causes. A reason for the popular error is not far to seek. The weather changes, especially in countries lying within the temperate zone, follow one another at short and seemingly irregular intervals; the changes of the moon's phases occur also at short but regular intervals. Coincidences between the two must frequently occur, but humanity is apt to notice these and to forget the failures of coincidence which are just as numerous if not more so.

Origin.—The past and future history of our satellite has been the subject of interesting re-

searches during the last 30 years, principally undertaken by Professor George Howard Darwin. The chief influence in its life history is assigned by him to tidal action, an idea first broached in 1754 by the philosopher Emmanuel Kant. Imagining that the earth, unattended by any satellite, was in a molten condition—the most probable supposition in view of its nearly spherical form and the nature of its surface—Professor Darwin inquires under what conditions its rotation should be so rapid that, like a bursting fly-wheel, portions of matter should be thrown off. He finds that this would happen if the earth were rotating about its axis in something like two hours. He has also shown that pear-shaped and dumb-bell shaped forms will result from a rapid rotation and from the action of the sun in producing tides; the moon might have been evolved from such a figure by the thinning and breaking of the handle. The earth would then have a satellite revolving very close to its surface in the same time that the earth took to turn on its axis. Either of these hypotheses seems to be allowable.

Past History.—From this point, rigorous argument takes the place of speculation. The period of the satellite's revolution (a "month") begins to be slightly longer than that of the earth's rotation on its axis (a "day"). The moon raises tides on the earth and the friction of these, like a break on a fly-wheel, gradually lengthens the day; the reactionary effect on the moon is to increase the length of the "month" also, but more rapidly than the "day." This goes on until the number of "days" in a "month" is 29. After this date, the month and day still go on getting longer but at different comparative rates, so that the number of days in a month diminishes until it is $27\frac{1}{3}$ —the present condition. The time in which all these changes have taken place must be reckoned in millions or tens of millions of years and though both bodies have grown cool and solid, the water on the earth's surface has in the later portion maintained the process at a slower rate. All this time the tidal friction has also had the effect of sending the moon further and further away from the earth.

Future.—In the future, the same processes will continue. The lengths of the month and that of the day will continue to increase, the latter overtaking the former until they are both over 1,300 hours or about 55 of our present days. Then, not only will the moon turn always the same face to the earth, but the earth will turn the same face to the moon and they will move together as if strung on a rigid bar. The same causes have operated to cause the moon always to present the same face to the earth. When the satellite was in a molten condition and not far from the earth, the tides raised on it by the attraction of the earth must have been enormous. The friction of these tides passing over the surface of the moon then slowed down the rotation of the moon on its axis until it was in a position where no more friction could act; that is, high tide on the moon was always at the same place on the moon and just under the earth. The axis of the moon in the direction of the earth must from this cause be a little longer than the other axes, though the difference has not been certainly observed.

Bibliography.—Besides the numerous textbooks on general astronomy, all of which contain

MOON HOAX—MOONWORT

information, readers may consult Nasmyth, 'The Moon' (2d ed. 1903); Neison, 'The Moon' (1873); Proctor, 'The Moon' (1876); the 'Lunar Theory' (1896) by the writer is a mathematical treatise on its motions. 'The Tides,' by Darwin, contains the latest theories concerning its past and future history. A new photographic atlas and description by Pickering has just appeared. The Lick and Paris observatories are also gathering materials for a complete description and charts of the surface.

ERNEST W. BROWN,
Haverford College, Haverford, Pa.

Moon Hoax, The, an ingenious work by Richard Adams Locke, published in 1859. It pretends to announce the discovery of a vast human population in the moon. Its contents first appeared in 1835, in the New York *Sun*, under the title, 'Great Astronomical Discoveries Lately Made by Sir John Herschel'; increasing the circulation of that paper, it was said, fivefold. The skit was soon afterward published in pamphlet form, the edition of 60,000 being sold in less than a month. This account purported to be taken from the Supplement to the Edinburgh 'Journal of Science,' and was most circumstantial. The discovery was asserted to have been made at the Cape of Good Hope, by means of a new and vastly improved telescope invented by Herschel, but unfortunately destroyed by fire. The sensation produced by this nonsense was widespread and profound. The press took sides for and against its authenticity, and for some time a large public credited the statements made.

Moon, Mountains of the, Africa, a mythical chain of mountains designated by Ptolemy as containing the sources of the Nile, and extending across the broadest part of Africa, from Cape Guardafui on the Indian Ocean, to the Bight of Benin, on the Atlantic. Modern exploration has proved that no such range exists, though there are numerous different mountain systems in that extensive region. The only mountains that can be looked upon as representing the ancient Mountains of the Moon lie in eastern Equatorial Africa. The loftiest of these are Mount Kilimanjaro, which is estimated to be 18,800 feet high, Mount Kenna, which has an estimated elevation of 18,000 feet, and Ruwenzori, which is also 18,000 feet in height.

Mooney, moo'nī, James, American ethnologist: b. Richmond, Ind., 10 Feb. 1861. He was educated in the public schools, engaged for a time in teaching and in 1879 entered a newspaper office. He continued the study of Indian ethnology which had fascinated him from boyhood and in 1885 became a member of the Bureau of American Ethnology at Washington. He has made a series of investigations covering the Southern and Western Indian tribes and prepared the government Indian exhibits for the Chicago, Nashville, Omaha, and St. Louis expositions. He has published: 'Medical Mythology of Ireland' (1887); 'Holiday Customs of Ireland' (1890); 'The Ghost-Dance Religion and the Sioux Outbreak of 1890' (1892-3); 'Calendar History of the Kiowa Indians' (1898); etc.

Mooney, John Aloysius, American author: b. New York 20 May 1843; d. Hurricane Mountain, Adirondack Mountains, 26 July 1903. He

was graduated from Saint Francis Xavier's College in 1850, and in 1889 received from his alma mater the degree of LL.D. His works were chiefly philosophical, historical, and theological, and appeared first in monthly and quarterly periodicals in America and Europe. Among them are: 'Giordano Bruno'; 'Art and Artists' (1886); 'Professor Janssen and Other Modern German Historians' (1887); 'Antonio Franchi' (1890); 'Rosmini and Gioberti' (1892); 'Joan of Arc'; 'Law and Liberty in Medieval Spain'; 'Biography of Archbishop Corrigan' (1903); and many others.

Moon'eye, a fish of the small family *Hyodontida*, related to the herrings, and sometimes called toothed herrings. They inhabit the rivers and lakes of the interior of North America, and are elegant, silvery, large-eyed fish, 8 to 12 inches long, extraordinarily well supplied with teeth, and voracious. "They are eager biters, and take indiscriminately the feathered lures, small spoons, grasshoppers, grubs and other natural baits." In Canada they afford much sport in fly-casting, and repeatedly leap into the air when hooked, like trout. The principal species called moon-eye is *Hyodon tergisus*; the more northerly one, called toothed herring and la quèche (Canada), is *H. alosoides*. Neither is good for food.

The "Moon-eye cisco" is a small whitefish (*Argyrosomus hoyi*), related to the lake herring (see WHITEFISH).

Moon'fish, any of the compressed ovate highly silvery fishes of the genera *Sclene* and *I'omer*, including small tropical forms allied to the pompanos. One greenish species (*I'omer setipinnis*) is well known in New York Bay and markets as a pan-fish, sometimes called blunt-nosed shiner. More widely recognized is the look-down or horse-head (*Sclene omer*), which reaches a length of two feet, and is regarded along the South Atlantic coast as one of the best of food-fishes; it also occurs along the western coast of Mexico and Central America, as do certain other species. It has a rhomboidal outline, with the hind-head greatly elevated, the line of the profile almost equal to the length of the body; and the dorsal and ventral fins prolonged into streamers. Consult Jordan and Evermann, 'Food and Game Fishes' (1902).

Moonga, or Moogha. See SILKWORM.

Moon'seed. See SARSAPARILLA.

Moon'shiner, a term applied in the United States, and especially in the Southern and Western States, to makers of illicit whiskey, and other spirituous liquors. Moonshine stills are frequently raided by the secret service officers. Of late years the business has been largely confined to the Tennessee and Kentucky mountain regions.

Moon'wort, a popular name for a fern (*Botrychium virginianum*) of the natural order *Ophioglossacea*, and also for various species of *Lunaria* of the natural order *Crucifera*. The former is the most popular of its genus, being readily grown in partial shade and with no special treatment; the latter are also readily cultivated under ordinary garden conditions and are popular because of their showy flowers but more especially because of their large, flat pods which are used in winter decorations. One of their popular names, honesty, is suggested by

visibleness of the seeds through the pods. *Lunaria annua*, especially its variegated variety, is the most valuable species.

Moore, moor or mör, Alfred, American jurist, son of Maurice Moore (q.v.): b. Brunswick County, N. C., 21 May 1755; d. 15 Oct. 1810. At 20 he became captain in a regiment of North Carolina troops, but was soon afterward obliged to resign in order to provide for his destitute relatives. When the British seized Wilmington, however, he raised a troop of volunteers, with whom he rendered great service to the American cause. In order to alleviate the distress to which his patriotism had reduced him, the general assembly in 1790 made him attorney-general; and though he had not yet mastered the first rudiments of law, he soon attained, by hard study, a foremost rank in his profession, was raised to the bench in 1798, and became associate justice of the Supreme Court of the United States in 1799. He resigned in 1805.

Moore, Benjamin, American Protestant Episcopal bishop: b. Newtown, L. I., 5 Oct. 1748; d. New York 27 Feb. 1816. He was graduated at King's (now Columbia) College in 1768, studied theology, and in May 1774 went to England to obtain orders, and in June of the same year was ordained deacon and priest. On his return to New York he became an assistant minister of Trinity Church, and succeeded to the rectorship in December 1800. In 1801 he was consecrated bishop of New York. He was also rector of Trinity Church and president of Columbia College. In 1811 he was attacked by paralysis, which rendered him incapable of further active duty, and an assistant bishop was consecrated in May of the same year.

Moore, Charles Herbert, American professor of art: b. New York 10 April 1840. He was educated at Harvard and has been art professor there for many years. He has published 'Examples for Elementary Practice in Delineation'; and 'The Development and Character of Gothic Architecture' (1889, enlarged ed. 1899). In the latter work, which has been widely circulated among students of architecture, he takes the position, earlier adopted by Viollet le Duc, that English Gothic is wholly a development from a French source, and that the progress of the art in England was always some years behind its French original. His warm advocacy of this view has excited some opposition among English critics.

Moore, Charles Leonard, American poet: b. Philadelphia, Pa., 16 March 1854. He was educated in the public schools of Philadelphia, and in 1878-9 was United States consular agent at San Antonio, Brazil. He has published: 'Atlas' (1881); 'Poems Antique and Modern' (1883); 'Book of Day Dreams' (1883); 'Banquet of Palacios' (1889); 'Odes' (1896); 'Ghost of Rosalys' (1900); etc.

Moore, Clement Clarke, American educator and poet: b. New York 15 July 1779; d. Newport, R. I., 10 July 1863. He was a son of Benjamin Moore (q.v.); was graduated at Columbia College in 1798; in 1821 became professor of biblical learning at the General Theological Seminary, New York, and retired from that position in 1850. He gave to the seminary the ground on which it stands. A collection of

'Poems' which he published in 1844 included 'A Visit from Saint Nicholas,' better known under another title—'Twas the Night Before Christmas'—which has long had great popularity with grown people as well as with children. Written in 1822 for his own children, these verses were printed anonymously, and without Moore's knowledge, in the Troy 'Sentinel' 23 Dec. 1823. He also compiled a 'Hebrew and English Lexicon' (1809), and wrote 'George Castriot, Surnamed Scanderbeg, King of Albania' (1850). Consult Stedman, 'An American Anthology' (1900).

Moore, David Hastings, American Methodist bishop: b. Athens, Ohio, 4 Sept. 1838. He was graduated from the Ohio University in 1860 and ordained to the ministry in that year, but entered the Federal army at the outbreak of the Civil War and remaining in it till the close of the War and attaining the rank of lieutenant-colonel. He has been president of the Cincinnati Wesleyan College and of the Colorado Seminary, and chancellor of the University of Denver. He was elected bishop in 1900, and is stationed in Shanghai, China, in charge of the missions of China, Japan, and Korea.

Moore, Edward, English Dante scholar: b. Cardiff. He was educated at Pembroke College, Oxford, where he received high honors and became honorary fellow, and in 1864 became principal of Saint Edmund Hall. His early research was on Aristotle, and his editions of the 'Ethics' and of the 'Poetics' are excellent. But he is much more favorably known for his studies of Dante, and has published: 'Time References in the Divina Commedia' 1887; revised, in Italian, 1900; 'Textual Criticism of the Divina Commedia' (1889); 'Dante and His Early Biographers' (1890); the 'Oxford Dante' (complete in one volume 1894); and 'Studies in Dante' (2 series 1896, 1899).

Moore, Frank Frankfort, British novelist and dramatist: b. Limerick, Ireland, 15 May 1855. He was educated at the Royal Academical Institution, Belfast, and has traveled extensively in Africa, India, and South America. From 1876 to 1892 he was art editor of the Belfast 'News Letter.' He has since lived in London. Among his novels are: 'Sojourners Together' (1875); 'Told by the Sea' (1877); 'Tre, Pol, and Pen' (1887); 'A Grey Eye or So' (1894); 'They Call It Love' (1895); 'The Jessamy Bride' (1897); 'Nell Gwynne' (1900); 'The Capture of Coralie' (1900). Popular plays by him include 'Moth and Flame' (1878); 'Broken Fetters' (1881); 'Oliver Goldsmith' (1892); 'The Discoverer'; 'Kitty Clive' (1895); etc.

Moore, George, English author: b. Ireland 1853. He studied art in London under Luyten, but completed his education in France, and was thoroughly imbued with a Gallic spirit. Apart from a few contributions to periodicals, his first literary work was contained in two volumes of quasi-French verse, 'Flowers of Parnassus' (1877) and 'Pagan Poems.' With his entry into fiction he allied himself immediately with the French realistic or naturalistic school, as may be seen in 'A Mummer's Wife' (1884), a story of the degeneration of a farmer's wife, her elopement with a strolling player,

MOORE

and the sufficiently squalid sequel; in 'Mike Fletcher' (1891), in which a gay young Irishman wins a fortune by his wits and his social success, and then swings from his riotous living to remorse and back again, only to commit suicide at the end; or in 'Esther Waters' (1894), a detailed sketch of life among the servant class and in a country inn, the theme being the allurements of gambling. 'Evelyn Inness' (1898) and its sequel, 'Sister Teresa' (1901), are a keen analysis of a musical and sensuous temperament under the successive influence of social temptation and of convent life. What he exemplified in these novels he stated abstractly but over-eagerly and passionately in 'Confessions of a Young Man' (1888) and 'Impressions and Opinions' (1890), both urging the dead level of mediocrity or worse in English literature of the day as contrasted with French. His desire to found an English 'Theatre Libre' and his growing conviction that the English stage and English novel were far gone led him to form the Irish Literary Theatre in Dublin and to take a prominent part in the movement styled The Irish Renaissance, a movement of which his 'Bending of the Bough' (1900) is one of the most promising dramatic productions.

Moore, George Foot, American Orientalist: b. West Chester, Pa., 15 Oct. 1851. He was graduated at Yale in 1872, and at Union Theological Seminary in 1877. Entering the Presbyterian ministry, he was pastor of the Putnam Presbyterian Church, Zanesville, Ohio, 1878-83, and in the latter year became Hitchcock professor of Hebrew and the history of religions at Andover Theological Seminary, and from 1899 to 1901 was president of the faculty there. Since 1892 he has been professor of biblical literature and the history of religions at Harvard. For some years he edited the 'Journal of the American Oriental Society.' He has written: 'A Commentary on Judges' (1895); 'The Book of Judges,' a translation with notes for the Polychrome Bible (1898); and 'The Book of Judges in Hebrew' (1900).

Moore, George Henry, American historical writer: b. Concord, N. H., 20 April 1823; d. New York 5 May 1892. In 1839 he removed to New York, and was graduated at the University of the City of New York (now New York University) in 1843. As assistant to his father, Jacob Bailey Moore (q.v.), librarian of the New York Historical Society, he had been long connected with that institution when, in 1849, he succeeded to his father's position, which he held until 1872, and then became first superintendent of the Lenox Library. This office he retained until his death. His contributions to the proceedings of historical societies and to historical magazines were numerous. He also published: 'The Treason of Charles Lee' (1858); 'The Employment of Negroes in the Revolutionary Army' (1862); 'Notes on the History of Slavery in Massachusetts' (1866); and 'A History of the Jurisprudence of New York' (1872).

Moore, Harry Humphrey, American artist: b. New York 1844. He studied under Gérôme at Paris and Fortuny in Madrid, and subsequently made painting tours through Ger-

many, Italy, and as far east as Japan. He has devoted himself to such genre pictures as his two masters excelled in, and his best known works are: 'Gypsy Encampment, Granada'; 'Moorish Water-Carrier'; 'Almeh'; 'The Blind Guitar-Player'; and 'A Moorish Beggar.'

Moore, Sir Henry, English colonial governor: b. Vere, Jamaica, 1713; d. 1769. In 1756 he became lieutenant-governor of the island, and until 1762 was practically in control of its affairs. He suppressed the slave insurrection of 1760, and for that service was rewarded with a baronetcy. Appointed governor of New York in July 1765, he reached there at the outbreak of the Stamp-Act excitement. Public opinion was strongly pronounced against the act, and Moore, yielding to the demands of the colonists, suspended its enforcement. He remained governor until his death.

Moore, Henry, Irish Wesleyan clergyman: b. near Dublin 1751; d. 1844. He joined a Methodist class in 1777, began to preach, gave up his trade of wood-carver, opened a school, and in 1779 was appointed by Wesley to the Londonderry circuit. Called later to London, he assisted Wesley (1784-6) as traveling companion and amanuensis, serving again in the same capacities 1788-90. Wesley appointed him one of his three literary executors, and also selected him to become (after Wesley's death) one of 12 ministers in charge of services at the City Road Chapel, London. In 1804, and again in 1823, Moore was president of the Wesleyan Conference. Refusing ordination in the Church of England, he was ordained by Wesley, with two Episcopal clergymen assisting. The proposal of a hierarchy for the Methodist Church was opposed by Moore, who also objected to the scheme for establishing a Methodist theological school, likewise to the proposed acquisition of land by the Methodist body in 1839, when the centenary fund was created. In 1792, with Thomas Coke, he published a 'Life of the Rev. John Wesley.' Although the work was authorized by the Conference, the third literary executor prevented them from using Wesley's papers in its preparation. With the aid of these a new 'Life' was published in 1824-5. Moore also wrote: 'A Reply to Considerations on the Separation of the Methodists from the Established Church' (1794); 'Thoughts on the Eternal Sonship' (1816); 'The Life of Mrs. Mary Fletcher of Madeley' (1817); 'A Short Account of Miss Mary Titherington of Liverpool' (1819); 'Sermons,' with an autobiography (1830). Consult his life (with the autobiography) by Mrs. Richard Smith (1844).

Moore, James, American colonial leader: b. probably in Ireland about 1640; d. 1706. He is supposed to have been a son of the Irish rebel Roger Moore, and to have come to this country about 1665. Settling in South Carolina, he became a leader among those who openly resisted the lords proprietors in their oppressive demands. In 1682 he was made a member of the governor's council, and in 1692 was sent to the Assembly. In the latter year the proprietors named him for exclusion from their pardon. Two years later he was again one of the governor's council; that body in 1700 elected him governor; and he filled the ex-

MOORE

executive office until 1793, when Sir Nathaniel Johnson arrived. Appointed by the Assembly to lead an expedition for the capture of Saint Augustine, Moore took the town without difficulty, but failed to reduce the fort. Under Governor Johnson he served as attorney-general, and was successful in an expedition against the Apalachee (q.v.). Consult McCrady, 'History of South Carolina Under the Proprietary Government' (1897).

Moore, James, American colonial officer: b. Charleston, S. C., 1667; d. 1723. He was a son of the James Moore preceding, in whose expeditions against the Indians he participated. In 1713 Gov. Craven appointed him commander of the forces sent to aid the North Carolina colony against the Tuscarora Indians, and two years later served as lieutenant-general of an expedition sent to subdue the Yamasi. In 1719, when Gov. Robert Johnston was deposed, the Convention having made an end of the proprietary government, Moore became governor. He was succeeded in 1721 by Francis Nicholson, who was commissioned by the English crown.

Moore, John, Scottish physician and author: b. Stirling, December 1720; d. Richmond, Surrey, 21 Jan. 1802. Having obtained a knowledge of medicine and surgery he went to the Netherlands in 1747, and served as a mate in the military hospitals. Returning to Scotland he practised till 1772. In that year he became medical attendant to the 9th Duke of Hamilton, whom he accompanied on a five-year tour on the Continent. In 1779 he published 'A View of Society and Manners in France, Switzerland, and Germany' which passed through numerous editions, and has been translated into several foreign languages. In 1781 appeared his 'View of Society and Manners in Italy'; and in 1785 'Medical Sketches,' followed by 'Zeluco,' a novel (1786); 'A View of the Causes and Progress of the French Revolution' (1795); and two other novels, which were not so successful as his first.

Moore, Sir John, British soldier, son of the preceding: b. Glasgow, Scotland, 13 Nov. 1761; d. Spain 16 Jan. 1809. He served as brigadier-general in the West Indies (1795), in Ireland during the rebellion of 1798, in Holland in 1799, and in Egypt in 1801. Moore was by this time one of the most distinguished of British generals and in 1805 was knighted. Appointed commander-in-chief of the British army in Portugal to operate against Napoleon in 1808, he advanced to Salamanca in spite of the gravest difficulties, but was finally compelled to retreat to Coruña, in face of a superior force. The absence of the fleet to receive his army forced him to a battle against Marshal Soult, in which Moore fell, mortally wounded, in the hour of victory. At the present time he is chiefly remembered through Wolfe's celebrated poem, 'The Burial of Sir John Moore.' Consult Carrick Moore, 'Life of Sir John Moore' (1835).

Moore, John Bassett, American lawyer, politician, and educator: b. Smyrna, Del., 3 Dec. 1860. He was graduated from the University of Virginia in 1880; was admitted to the bar in 1883; in 1886-91 was 3d, in 1898 1st, assistant secretary of state; in 1887 was United States secretary in the Samoan conference, in 1887-8

at the fisheries conference; and in 1898 was council and secretary to the United States peace commission at Paris. In 1891 he became professor of international law and diplomacy at Columbia University, and in July 1903 was chosen president of the University of Virginia. He is a recognized authority on international law, has written 'A Treatise on Extradition and Interstate Rendition' (1891); 'Kossuth' (1895); 'History and Digest of International Arbitrations' (1898); and other works.

Moore, Maurice, American patriot and jurist: b. Brunswick County, N. C.; d. 1777. Having studied for the bar, he acquired a high reputation as a lawyer, was one of the three colonial judges of North Carolina at the time of the Revolution, was a member of the provincial congresses at Hillsborough in 1775 and Halifax in 1776, and had a prominent part in framing the constitution of North Carolina. He was one of a committee appointed at the commencement of the Revolution to draw up an address to the people of Great Britain on the wrongs of the North American colonies.

Moore, Thomas, Irish poet: b. Dublin 28 May 1779; d. Bromham, near Devizes, 25 Feb. 1852. He was educated at Trinity College, Dublin, with a view of becoming a lawyer, and in 1800 entered as a student at the Middle Temple. The office of collector at Bermuda was bestowed on him in 1803. He found the post a sinecure, and quitted it after appointing a deputy to perform his duties. In November 1804 after a tour through the United States and British America, he was back again in England. In 1806 he published 'Odes and Epistles,' which contained some attacks on America, and, castigated by Jeffrey in the 'Edinburgh Review,' occasioned the memorable duel between him and the distinguished critic. Moore entered in 1807 into an engagement with Power, the music publisher, to produce a series of adaptations to the national Irish airs, he furnishing the words and Sir John Stevenson the music. This great undertaking, which extended over a number of years, only completed in 1834, is the work on which his reputation will mainly rest. Many of the numbers, such as 'The Last Rose of Summer,' and 'Those Evening Bells,' are generally familiar. His 'National Airs' (1875) included 'Oft in the Stilly Night,' and the 'Sacred Songs' (1816); 'Sound the Loud Timbrel.' Moore was himself an excellent vocalist. 'The Twopenny Post Boy,' by Thomas Brown the Younger, a series of satires on the proceedings of the prince-regent and his ministers, appeared in 1812, and by their genuine wit attracted much attention. The same year he removed to Mayfield Cottage, near Ashbourne, Derbyshire, and here his 'Lalla Rookh' was elaborated. Its production was the result of an agreement with Messrs. Longman, by which he was to receive 3,000 guineas for a poem to form a quarto volume. It appeared in 1817, and its success fully justified the liberality of Moore's publishers. It was translated into numerous languages, and attained a European fame. Later criticism has deemed it rather a work, as Garnett says, "of prodigious talent," than of the genius ascribed to it in Moore's own day. The same year appeared a satirico-burlesque poem, 'The Fudge Family in Paris,' in the form of a series of amusing letters supposed to be written

by the different members of an excursion party to the Continent. 'Rhymes on the Road' and 'Fables of the Holy Alliance' followed in 1819. About this time he became involved in serious embarrassments by the defalcations of his deputy in Bermuda, and found himself suddenly called upon to make up a deficiency of £6,000, ultimately reduced to about £1,000. This vast sum he contrived to clear off by his literary earnings. In 1822 appeared his 'Loves of the Angels.' The 'Life of Sheridan' was produced in 1825, and the 'Epicurean,' a prose romance of small value, in 1827. Next came the justly praised 'Life of Lord Byron' (1830). (See BYRON.) His remaining works include the 'History of Ireland' (1846), written for Lardner's 'Cyclopaedia' and a task which he found very severe. For nearly the last 30 years of his life he resided at the cottage of Sloperston, near Devizes. A biography in eight volumes, edited from his journal and correspondence, was published after his death by his friend Lord John Russell (1853-6). Consult also: Vallat, 'Thomas Moore sa Vie et ses Œuvres' (1887); Gunning, 'Thomas Moore, Poet and Patriot' (1900).

Moore, William Thomas, American clergyman; b. Henry County, Ky., 27 Aug. 1812. He was graduated from Bethany College, W. Va. in 1838 and entered the ministry of Disciples of Christ the same year. He held several pastorates in that denomination in Frankfort, Ky., and Cincinnati, was for ten years pastor of West London tabernacle, England, and since 1896 has been dean of the Missouri Bible College at Columbia, Mo. He has published 'Living Pulpit of Christian Church' (1868); 'The Fundamental Error of Christendom' (1902); etc.

Moore, Willis Luther, American meteorologist; b. Scranton, Pa., 18 Jan. 1856. At eight years he joined his father who was with Grant's army at City Point, and sold papers to the troops in the field. He was educated in Binghamton (N. Y.) public schools, became compositor and reporter on the Binghamton 'Republican'; and was on the Burlington 'Hawkeye' at the time he entered the Signal Corps (now Weather Bureau). He rose through successive grades until appointed professor of meteorology in 1894 as a result of an open competitive examination against 23 of the ablest meteorological scientists of the country. He was assigned to the charge of the forecast district at Chicago; and in 1895 became chief of the Weather Bureau. He is a well known speaker and lecturer on meteorological subjects, and has published 'Moore's Meteorological Almanac and Weather Guide' (1901); and contributed to scientific magazines and other publications.

Moore, Zephaniah Swift, American educator, first president of Amherst college; b. Palmer, Mass., 20 Nov. 1770; d. 30 June 1823. He was graduated at Dartmouth College in 1793, entered the Congregationalist ministry, and preached at Leicester, Mass., from 1798 until 1811, when he was appointed professor of languages in Dartmouth College. He was chosen president of Williams College in 1815, but failing to procure the removal of the institution to the banks of the Connecticut, resigned in 1821, and was chosen president of Amherst College.

Moorehead, moor'- or mōr'hēd, Warren King, American archaeologist; b. Sienna, Italy, of American parentage, 10 March 1866. He was educated in public schools of Ohio, and devoted himself to the study of Indian archaeology and later studied three years in the Smithsonian Institution, and was afterward engaged in investigations of the earthworks and other Indian relics in Ohio for four years. He had charge of the investigations in Ohio, Utah, Colorado and New Mexico for the Chicago exposition and was curator of the museum of the Ohio State University. He is at present curator in the department of archaeology at Phillips Academy, and has published: 'Primitive Man in Ohio' (1892); 'Prehistoric Implements' (1900); etc.

Moore's Creek, a short stream in North Carolina, which flows into Cape Fear River about six miles above Wilmington. Moore's Creek is noted on account of a battle fought on its banks 27 Feb. 1776, between American and British forces. The British soldiers, nearly all Highland Scotch under Brig.-Gen. MacDonald numbered 1,500, and the Americans under Caswell and Lillington numbered 1,000. The charge was made by the British who tried to cross the stream on the girders of a bridge, the planks had been taken away, but the militia and minute men of the American force routed them. Fully 30 British were killed, many wounded, and about 500 taken prisoner. The victory gained by the Americans was an inspiration to the Carolinians; it had the same effect in the South that the Battle of Lexington had in New England.

Moore's Hill College, in Moore's Hill, Ind.; coeducational; opened in 1856 by Methodist Episcopalists. In 1902 the college had 10 professors and instructors, 150 students, and about 6,000 bound volumes and 2,000 pamphlets in the library. The grounds, buildings and apparatus were valued at \$35,000, the productive fund was \$23,000, and the annual income about \$6,000. The courses of study of the collegiate department lead to the degrees of A.B., B.S., and Ph.B.

Moorfowl, a British name for certain grouse (q.v.) found on the Scottish moors; or for the European gallinule (q.v.), commonly called moor-hen.

Moorhead, mōr'hēd, Minn., city, county-seat of Clay County; on the Red River of the North, and on the Great Northern and the Northern Pacific Railroad; opposite Fargo, N. Dak. It is in a productive farming region in which wheat is one of the great crops. It has flour mills, grain elevators, foundries, machine shops, brick yards, and stock yards. It is a trade centre for a large part of Clay and Norman counties, and ships large quantities of wheat. It is the seat of Concordia College, the Sharp High School, a State Normal School, and has public and parish schools. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 2,088; (1900) 3,730.

Moorish Architecture. See ARCHITECTURE, Moslem.

Moorish Art. See MOHAMMEDAN ART.

MOORS — MOOSE

Moors (Lat. *Mauri*; Sp. *Moros*; Dutch, *Moors*), the people of Morocco. The Arabs who conquered Mauritania in the 7th century converted to Mohammedanism the native population, who in Europe were still called Moors, though in their own language they called themselves Berbers, while by the Arabs they were termed Moghribees, "westerners" or "men of the west." Arabic manners and customs, and in a corrupt form the Arabic language, soon prevailed in the country, the Arab conquerors freely amalgamating with their converts, who far exceeded them in numbers. In 711 an army drawn from this mixed population, under Arab leaders, crossed the straits at Gibraltar, so named from their leader, and began the conquest of the Spanish peninsula. The Spaniards and Portuguese called these invaders Moors because they came from Mauritania, and the term Moors with them soon became synonymous with Mohammedans or Moslems, as the invaders designated themselves. The Spanish writers subsequently applied the term to all the Mohammedans of northern Africa; and when, at the close of the 15th century, the Portuguese made their way around the cape of Good Hope and encountered the Arabs on the coasts of East Africa and of Asia, they still called them Moors. Even the Turks, who in race, in language, and in everything but religion, were foreign and alien to both Moors and Arabs, were sometimes loosely spoken of as Moors by the Spanish historians.

Moos, mōs, Salomon, German aurist: b. Randegg, Baden, 15 July 1831; d. Heidelberg 15 July 1895. He studied at Heidelberg, Prague, and Vienna; in 1859 he became private docent at Heidelberg and in 1866 professor of aural surgery there. His most valuable researches were in relation to the diseases of the labyrinth of the ear, and he was the first to demonstrate that in certain infectious diseases, micro-organisms within the ear labyrinth cause derangement of hearing and equilibrium. He wrote 'Klinik der Ohrenkrankheiten' (1866); 'Anatomie und Physiologie der Eustachischen Röhre' (1874); 'Über Meningitis cerebri-spinalis epidemica' (1881); 'Über Pilzinvasion des Labyrinths im Gefolge von einfacher Diphtherie' (1887), 'und im Gefolge von Masern' (1888); 'Histologische und bakterielle Untersuchungen über Mittelohrerkrankungen bei den verschiedenen Formen Diphtherie' (1890). He also founded and edited with Knapp the 'Zeitschrift für Ohrenheilkunde.'

Moose. The deer family (*Cervidae*) embraces not only all the round-horned deer, but also the caribou and moose, whose horns are flattened in a manner known as "palmation." Of this family, the American moose (*Alces americanus*) is the most colossal and also the most picturesque member. The moose of Europe and Asia, there called "elk" (q.v.), is a much smaller animal. Even in comparison with the largest American elk, our moose is a giant, and it is impossible to appreciate fully the great height and bulk, length of leg and size of antlers of this wonderful creature, without seeing a full-grown bull, either in his native wilds or mounted in a museum.

At nearly every point the species presents a peculiarity. The largest specimens ever shot

and measured by naturalists stood from 78 to 84 inches in height at the shoulders. The body is very short in comparison with the great length of the legs, but the depth of the chest is unusually great. The end of the nose is flabby and pendulous, and overhangs the end of the chin by three or four inches. In browsing it is half prehensile, and is of great use in conveying twigs into the mouth. A moose in full winter pelage is covered by a coarse thatch of straw-like hair, from three inches in length on the body to six inches on the neck and shoulders. The color of the hair is purplish-gray, and for an animal which lives so far north, the pelage is exceptionally coarse and open.

The antlers of the moose are strikingly peculiar. The upper two thirds of the beam is enormously flattened, often to a width of 12 inches or more, and the upper end of this great shovel of solid bone terminates in a row of from six to twelve short points. The single brow-tine is also well palmated, and usually terminates in three or four long points of great strength. Occasionally the main shovel throws out sidewise a palmated spur of striking form and size, and such a head when seen from the front presents a chaotic jumble of tines and palmations. The largest antlers known are in the Field Columbian Museum, and have a spread of 78 inches, greatest width of palmation 16 inches, thickness of palmation $2\frac{3}{4}$ inches, and a total of 34 points. The weight of the antlers and skull is 93 $\frac{1}{4}$ pounds. At least 25 pairs of antlers are known to exceed 70 inches in spread. The female has no antlers.

The moose is a browsing animal, and its favorite food consists of twigs of the willow, birch, hemlock, spruce, alder, aspen and maple. It also feeds upon moss, and in summer is very fond of wading in ponds and eating the stems and leaves of water-lilies. Because of their very unusual feeding-habits, moose are very difficult to rear in captivity to adult age. About 90 per cent die of gastro-enteritis before they attain the age of three years. For this reason, the market value of a live moose is far below its rarity and general desirability in a collection. Moose calves are born either singly or in pairs, in May or June. At birth an average specimen stands about 32 inches in height, and is a most grotesque-looking creature. Its first coat of hair is sandy red, like that of a buffalo calf. At 15 months old, a healthy young animal is about five feet high at the shoulders. The weight of a large adult male moose is between 1,100 and 1,200 pounds, but the maximum weight for the species would probably reach 1,500 pounds.

The range of the moose extends from Nova Scotia and New Brunswick to northern Alaska, a total distance along the axis of distribution of about 4,100 miles. In Maine, the average number of moose killed during 1900-3 appears to have been between 250 and 300.

The valley of the Ottawa River and its tributaries yet affords good hunting for moose, and so does northern Manitoba. The species still exists in small numbers in northern Minnesota, and along the western slope of the Rockies as far down as the head of Green River, Wyoming, its southern limit (lat. 43°). Northward, moose are found in British Columbia, Alberta, Athabasca, Yukon and in many portions of Alaska.

MOOSE-BIRD — MORAIS SABATO

Those found on the Kenai Peninsula and north of Cook Inlet have the most massive and widespread antlers to be found, and have even been described as an independent species, under the name of *Alces gigas*.

Everywhere throughout its range, the killing of moose is regulated by law. The open seasons are very short, the number that may be killed by each hunter is limited to one or two males, and the killing of females is forbidden. For the protection of the species in Alaska, Congress enacted in 1902 a stringent law, which will at least serve to prevent much of the reckless slaughter that up to that time had been proceeding. But, despite all laws that can be framed and enforced, the size of the moose, and its desirability, both as a hunters' trophy and for food, render it practically certain that the species will be destroyed far faster than it breeds, and that 25 years hence it will be as nearly extinct in America as the buffalo is today.

WILLIAM T. HORNADAY,

Director New York Zoological Park.

Moose-bird, one of the names in eastern Canada for the Canada jay. See JAY.

Moose-fly, a small biting fly (*Hematobia alcis*) parasitic on the moose and very annoying to that deer in the Northwest. It is closely related to the horn-fly (q.v.).

Moose-wood, a local name in the Eastern States and Canada for either of two shrubby trees of whose leaves and twigs the moose is fond: (1) the striped maple or whistle-wood (see MAPLE); (2) leatherwood (see CYRILLA).

Moosehead, the largest lake in Maine, is on the boundary between Piscataquis and Somerset counties. It is about 35 miles long and its average width is about seven miles. A number of rivers flow into the lake, and its direct outlet is Kennebec River. Some of its waters enter the Penobscot by way of a short stream and the lakes which are the source of the Penobscot. The region around still retains many of its primitive features, game abounds, fish fill its waters, and but few people inhabit the region near the shores. The Canadian Pacific Railroad passes along the southwest shore and connects the villages of Greenville and Moosehead.

Moot. See FOLK-MOOT.

Mop'sus, a legendary Greek prophet, son of Apollo, who vanquished Calchas in prophetic skill. Mopsus fell by the hand of the prophet Amphilochus. The name is also commonly used of the shepherd poets of Greek bucolic poetry, and hence of pastoral poetry generally.

Moquegua, mō-kā'gwā, Peru, a department in the southern part of the republic, bounded on the north by the department of Arequipa, on the east by Puno, on the south by Chile, and on the west by the Pacific Ocean. Area, 5,549 square miles. The eastern part is crossed by the Andes Mountains. The fertile portions of the department are on the mountain slopes, the region along the coast is a rainless desert. The chief products are brandy and wine. Pop. est. 50,970. (2) Moquegua, the capital, is southeast of the centre of the department. Pop. 6,125.

Moqui (mō'kē) **Indians**, a semi-civilized tribe living in northern Arizona. The first ac-

counts of them date from the expedition of Coronado in 1540. Their history is strikingly similar to that of the Indians of New Mexico, except that after a successful revolt against the Spaniards, in 1680, they remained independent. They are kind-hearted and hospitable, cultivate the soil, raising grain and vegetables, and possessing large flocks of sheep and goats. They weave very fine blankets, an art which they have taught several neighboring tribes. The houses are built of stone, set in mortar, and for security are perched upon the summits of almost inaccessible mesas. They number about 1,600. See INDIANS.

Mo'ra Stone, a ceremonial stone or group of stones, near Mora, five miles southeast of Upsala, Sweden, where the kings of Sweden were chosen in a great meadow. On the stone in the middle of the meadow the king sat after the election, and the people put by the large stone a smaller one with the king's name, thus promising him their loyalty. Only a few stones still remain and the inscriptions are battered and weather-beaten.

Mora'cea, a family of trees and shrubs (rarely herbs), related on the one hand to the elms and on the other to the nettles, whose botanical characteristics are: flowers unisexual, usually with four perigone leaves; stamens straight or inflexed in the bud; ovary dimercous, with one suspended, anatropous ovule; stipules caducous; juice milky. The species are mainly tropical, and include the mulberries, figs, banyans, etc., bread-fruit, osage-orange, rubber or caoutchouc plants, upas tree (qq.v.) and others. The family is economically valuable in various ways.

Moradabad, mō-rā-dā-bād', or **Muradabad**, India, the capital of a district of the Rohilkhand division, United Provinces of Agra and Oudh, 75 miles by rail east of Meerut on the Ramganga River. The town is of Afghan foundation dating from 1625. It is noted for its inlaid metal-work in brass and tin, and for its chintz manufactures. It carries on a considerable trade in the agricultural produce of the district. It has a cantonment of native soldiers, two mosques, an Anglican church and an American Methodist mission. Pop. (1901) 75,176.

Moraes, José Prudente de, hō-sā proodān'tā dā moo-ris', Brazilian politician: b. Itú, São Paulo, Brazil, 1841; d. there 30 Nov. 1902. He studied law and entered early upon a political career and after the political uprising which deposed Dom Pedro was elected governor of São Paulo. He was president of the Constitutional Assembly and was elected president of the republic in 1894. Political troubles compelled his retirement for a short time in 1896 but he was re-elected and retained the office until 1898 when he was defeated by Campos Salles.

Moraine. See GLACIER.

Morais Saba'to, American rabbi and educator: b. Leghorn, Italy, 13 April 1823; d. Philadelphia 12 Nov. 1897. He was carefully trained in Hebrew lore and taught first in Leghorn and then for a few years in London. In 1851 he came to Philadelphia and until his death was minister of the Mikve Israel Synagogue. In 1867 he was appointed professor of biblical exegesis in the short-lived Maimonides

MORAL PHILOSOPHY — MORAVIA

College of Philadelphia and was one of the founders and the first president of the Jewish Theological Seminary of New York. During nearly five decades of activity he was a representative of conservative Judaism, unremitting in his efforts in behalf of education and charity, an earnest and scholarly contributor to the Jewish press on historical, literary, and theological themes.

Moral Philosophy. See **ETHICS**.

Morales, Luis de, loo-ēs' dā mō-rā'lās, Spanish painter: b. Badajoz about 1509; d. there 1586. His early artistic life was spent in Andalusia; but he removed to Madrid in 1564, where he remained for the rest of his life, returning to his native city only to die. He was essentially Spanish in his conception of religious art, from his devotion to which he was called "El Divino." The main theme of his paintings was the Dead Christ, and the Mater Dolorosa. There is in them a blending of religious fanaticism with a sense of beauty which recalls the early Italian school, but his figures have the distorted and macerated air, which later became the accepted type in Spanish religious paintings. His drawing is monotonous and mannered, and his modeling such as to attenuate into half skeleton proportions the limbs and features, but his coloring is of sweet and melting tenderness. The Madrid Museum has several examples of this master, namely, an 'Ecce Homo,' a 'Mater Dolorosa,' and a 'Madonna.' A half-length figure of 'Christ Bearing the Cross' is in the Louvre under his name, and an 'Ecce Homo' of his hands in the Dresden gallery.

Moralities, the name given a class of allegorical plays, so termed because they consisted of moral discourses in praise of virtue and condemnation of vice. The dialogues were carried on by such characters as Good Doctrine, Charity, Faith, Prudence, Discretion, Death, etc., whose discourses were of a serious cast. Moralities were occasionally exhibited as late as the reign of Henry VIII. See **DRAMA**.

Moran, mō-rān', Edward, American painter: b. Bolton, Lancashire, England, 19 Aug. 1829; d. New York 9 June 1901. He was a pupil of Hamilton and Weber in Philadelphia and in 1862 went to Europe, where he studied in France and England for seven years. He afterward made his permanent home in New York. His best known pictures are marines, such as 'Outward Bound'; 'Launch of the Life-Boat' (1865); 'The Coming Storm in New York Bay'; etc. His historical series, representing epochs in American seafaring from the 'Landing of Leif Ericson' (1001) to 'Dewey's Return,' was completed in 1899.

Moran, Patrick Francis, Australian Roman Catholic archbishop and cardinal: b. Leighlin-bridge, Ireland, 16 Sept. 1830. He was educated at the Irish College of St. Agatha in Rome, and was later vice-president there. In 1856 he was professor of Hebrew in the College of the Propaganda in Rome and in 1872-84 he was bishop of Ossory. In 1884 he was elevated to the rank of third archbishop of Sydney and he became first Australian cardinal in 1885. He has published 'Acta S. Brendani' (1872); 'Irish Saints in Great Britain' (1879); 'The Reunion of Christendom and Its Critics' 1896; 'Letters on the Anglican Reformation'

(1890); 'History of the Catholic Church in Australasia' (1894); etc.

Moran, Peter, American artist: b. Bolton, Lancashire, England, 1842. He belongs to an artistic family being brother of Thomas Moran and of Edward Moran, both painters of reputation; he became their pupil at Philadelphia and chose landscape and animal life as his special department. Among his paintings are: 'Return of the Herd,' to which a medal was awarded at the Centennial Exhibition; 'Santa Barbara Mission'; and 'Pueblo of Zia, New Mexico.' He is also successful as an illustrator and etcher and at the Centennial of 1876 received a medal for his etchings of animals. He has two sons of rising reputation as artists.

Moran, Robert, American manufacturing machinist: b. New York 1857. At 14 he went to Cincinnati, where he worked in the rolling mills, spending his spare time in study; and three years later made his way from Cincinnati to New York, thence to San Francisco, and finally to Seattle, where he became fireman on a Sound steamer, instructed himself in mechanical drawing, rose to be chief engineer and pilot, and then with his brothers opened a machine shop. He obtained the contract for the navy yard pumps at Port Orchard; lost his entire establishment by the great Seattle fire of 1889, when as mayor he neglected his own property to oversee fire-fighting throughout the city; but immediately rebuilt; and in 1896 contracted for the U. S. torpedo boat Rowan, on which he exceeded the contract speed.

Moran, Thomas, American painter: b. Bolton, Lancashire, England, 12 Jan. 1837. He began the study of landscape painting at Philadelphia in 1856. In 1861 he visited Europe and copied some of Turner's paintings. When Professor F. V. Hayden visited the Yellowstone River he accompanied the expedition (1871) and in 1873 went with Major Powell to the Colorado. From the studies and sketches he then made he painted his 'F. V. Hayden's Expedition to the Yellowstone' and the 'Chasm of the Colorado,' now in the capitol at Washington.

Morava, mō'rā-vā, Servia, a river about 250 miles long, formed by the confluence at Staladsh of its headstreams, the western Morava rising near the southwest boundary, and the southern Morava, with its source in Kosovo, Turkey. It is the largest river in Servia and is navigable 50 miles from its mouth in the Danube River, 30 miles east of Belgrade.

Morava, a river of Austria-Hungary. See **MARCH**.

Mora'via (German, *Mähren*), Austria-Hungary, a western province bounded north by Prussia, northeast by Galicia, east and southeast by Hungary, south by Hungary and Austria, and west by Bohemia; area, 8,584 square miles. Moravia proper consists of a large basin surrounded by mountains, on the north the Sudetes, on the east the Carpathians, and on the west a low range of hills which gradually ascends towards the north until it unites with the Sudetes, and open only on the south, at a central point, toward which all its slopes converge and all its drainage is carried. Its climate is milder and more genial than that of most European countries under the same latitude.

MORAVIAN CHURCH

Moravia belongs to the basin of the Danube, all the smaller streams falling into the March or Morava, a tributary of the Danube. The minerals are of considerable importance, and include silver, lead, copper, iron, coal, graphite, etc. The soil is generally fertile, and all the ordinary cereal, leguminous, and root crops are raised in abundance. Flax of excellent quality is extensively grown in several districts, and fruit is so abundant that many parts of the country have the appearance of one great orchard; but the favorite culture is that of the vine, for which both the soil and exposure of the province are admirably adapted. The pastures, in general excellent, occupy a large extent of surface. The rearing of cattle, nevertheless, gets comparatively little attention, and is not sufficient to meet the home demand. Sheep, on the other hand, are reared in abundance, and are of good quality. They have been much improved by judicious crossing with the merino, and furnish a wool to the excellence of which the woolen manufactures of the country owe their prosperity. The horses, too, are of a strong, hardy, active breed, and are much used in the Austrian service for heavy cavalry. Manufactures have made great progress, and in all the great branches of industry—in iron and ironmongery, leather, linen, cotton, and woolen tissues, particularly the last—Moravia takes precedence of most of the provinces of the empire. Other manufactures deserving of notice are silk, glass, paper, potash, tobacco, and beet-root sugar. The trade in most of these articles is of considerable importance. In 1898 Moravia possessed 1,220 miles of railway, 2,478 miles of telegraph lines, and 7,083 miles of roads; its waterways are practically unimportant. About 70 per cent of the inhabitants are of Slavonian extraction, and 26 per cent Germans, the latter found mostly in the towns and on the borders. The language chiefly spoken and called Moravian is merely a Slavic dialect; German, however, is generally understood by all classes. The religion generally professed is Roman Catholic. Elementary education is generally diffused, and numerous gymnasia furnish education of a very superior order. There are theological colleges at Olmütz and Brünn (qq.v.), the latter city, the capital of the province. Moravia was anciently inhabited by the Marcomanni and Quadi, afterward by the Rugii, and still later by the Longobardi. It was finally occupied by a colony of Slavs, who took the name of Moravians from the river Morava. In 1029 Moravia was united to the kingdom of Bohemia, with which it had the same constitution, administration, and laws. In 1197 it was erected into a margraviate, with a separate court and a separate administration. With Bohemia it passed to the house of Austria in 1527. Moravia sends 36 members to the Austrian house of deputies. (See AUSTRIA, *Constitution*.) Pop. (1900) 2,437,706.

Moravian Church, The, the common name given in England and America to the renewed Unitas Fratrum or Church of the Brethren—for a time styled also in English, the Church of the United Brethren—which originally flourished in Bohemia, Moravia and Poland, was disrupted and suppressed in the 17th century, was resuscitated in Saxony in the 18th century and at present exists in its reorganized form in Europe and America with an extensive

mission work in many parts of the world. It was a product of the evangelical movement led by the Bohemian reformer, John Huss, who suffered martyrdom at Constance 6 July 1415. It developed out of an association formed in 1457 near Kunwald in northeastern Bohemia to foster pure Christian teaching and life within the National Church. Its attitude toward the abuses of the time and its rapid growth caused it soon to be put under proscription by the authorities. Drastic measures intended to suppress and disintegrate it had the contrary effect. It formed a more compact union, perfected its organization and gradually became a distinct Church with its own ministry, established through the good offices of Waldensian bishops who conveyed the historic episcopate to it in 1467. A system was developed which followed primitive Christianity in its elementary principles. It began with the Congregation as the unit, based on Scripture, bound by a Brotherly Agreement and governed by an elected eldership. With the increase of congregations, the Synod was formed, legislating by delegated authority. The Synod committed executive control to the Council which was also elective and representative, for while the episcopacy stood at the head, the presbytery and the laity had a voice in it, with the central principle of confessional government and collegiate administration fixed. This principle, inherited with the ancient episcopate, is cardinal in the modern structure of the Church, adjusting together conceptions of polity commonly regarded as opposites and presenting affinities to widely divergent church types.

Its history during the ancient period is to a great extent one of cruel persecution. Its speedy recuperation after such ordeals and its increase during intervals of peace were phenomenal. When the German Reformation began in 1517, the Bohemian and Moravian Brethren numbered nearly 200,000 with about 400 places of worship. In the baronial castle and in the peasant's cottage loyalty to their Church, which embodied the best ideals of the nation, rendered them amenable to a discipline in which they stood pre-eminent and made them a strong moral power to be coped with by ecclesiastical and political authorities. In their highest ascendancy they led the educational and literary activity of the regions in which they were established. Their formulated conceptions of Christian doctrine were a gradual growth. Their last and most mature confession of faith before the overthrow of the Church in its original seats was published in 1573.

The Counter-Reformation inaugurated by Ferdinand II. in 1621 brought the organized existence of the Church to an end in Bohemia and Moravia, subjected many of its members to martyrdom and drove thousands into exile. It was excluded from the terms made to other evangelical parties in the Peace of Westphalia which ended the Thirty-Years' war in 1648, and the hope of its resuscitation in its home-lands was crushed. The parishes of its Polish province, founded in 1548, maintained an organized existence much longer, but they were gradually absorbed by the Reformed Church of Poland of which ultimately even the clergy in whose persons the episcopate of the Unitas Fratrum was being perpetuated in the hope of its renewal, were legally recognized ministers.

MORAVIAN CHURCH

The first step in the restoration of the Church occurred in 1722, when a little company of refugees from Moravia were given an asylum by Nicholas Lewis, count of Zinzendorf, on his estate Berthelsdorf in Saxony where, on 17 June of that year, they began a settlement which was called Herrnhut. Many others from Moravia, Bohemia and different parts of Germany joined them during the next few years, and a gradual process of organization took place in which the plans of the Moravians were merged with those of Zinzendorf who had in view rather an Evangelical Association harmonizing different confessional affiliations and church traditions, with the necessary adaptation of the whole to its situation within the pale of the state church. The doctrinal articles of the Augsburg Confession were adopted and concessions from the Saxon and Prussian governments permitted the establishment of Moravian Church order and constitution modified to suit the new conditions.

The Moravian episcopate was transferred to the new organization on 13 March 1735, when David Nitschmann was consecrated a bishop at Berlin by Bishop Daniel Ernst Jablonsky with the written concurrence of Bishop Christian Sitkovius of Lissa, they being the last two surviving bishops of the old line. A notable spiritual experience which marked the year 1727, when the first definite organization took place at Herrnhut, produced an intense zeal for evangelization. The result, during the next few years, was the establishment of other congregations on the continent of Europe, the founding of the Church in England and America and the missions to the heathen which have chiefly given the Church its reputation. The first such mission was begun in 1732 on the Island of Saint Thomas, West Indies.

The first Moravian evangelist came to Pennsylvania in 1734. The first settlement in America and mission to the Indians was founded at Savannah, Ga., in 1735. Untoward political conditions caused its abandonment in 1740 and the removal of the colonists to Pennsylvania, where a permanent settlement arose in the present Northampton County, with organized activity in Philadelphia and New York and an extensive itinerary among white settlers and Indians. The Moravian pioneers in "the Forks of the Delaware" first located on a tract of land which the evangelist George Whitefield had purchased and named Nazareth, where he proposed to found a village and a negro charity school. This property came into possession of the Moravian Church in 1741. On another tract at the confluence of the Monocacy Creek and the Lehigh River its chief settlement was founded in that year and at Christmas 1741, when Count Zinzendorf was at the place, it received the name Bethlehem. In June 1742, a considerable colony from Europe joined the pioneers and the settlement was regularly organized. The population was divided into an itinerant and a local congregation, the former to engage in gospel work among white settlers and Indians, the latter to develop the settlement and provide support for the missionaries. Thus, from the first, Bethlehem was the centre of the Moravian Church in America and of its various activities.

Until 1762 a co-operative union was maintained at Bethlehem and Nazareth which was called the General Economy. All labored for a common cause and received sustenance from a

common stock, but there was no surrender of private property and no obligation which prevented the individual from withdrawing when he chose. Numerous colonies came to America during those years on vessels owned and managed by the Church and under the arrangement which existed results were accomplished which would not otherwise have been possible. The material benefits of the settlement were appreciated by the authorities of Pennsylvania, and the spiritual activities prosecuted by the Moravians, although misunderstood and opposed by some, as was the case also in Europe, were epoch-making in the religious growth of the country.

Two notable lines of effort in colonial times, in addition to the Indian missions, were the propagation of Zinzendorf's idea of evangelical alliance and denominational federation, and religious education of children. Desiring to diminish rather than increase denominational divisions the leaders of the Church generally refrained from organizing distinctly Moravian congregations and in consequence of this policy the Moravian Church remained numerically a small body. The European plan of the Church to concentrate in exclusive settlements to some extent, was followed for a full century. Besides Bethlehem and Nazareth, such church-villages, founded prior to the Revolutionary War, were Lititz in Lancaster County, Pa., Hope in Sussex, now Warren County, N. J.,—abandoned in 1808— and Salem, now a part of Winston-Salem in Forsyth County, N. C., the central settlement on a large tract of land purchased of the Earl of Granville and named Wachovia. These places continued long to be conserving centres of all that was distinctive in the religious and social life of the Moravian Church, as fostered under the influence of Zinzendorf's ideas and methods, presenting interesting experiments in municipal government, industrial order and general culture. They are yet the seats of widely known educational institutions, all founded in the 18th century. A few of the town and country congregations organized in colonial times, without the peculiarities of the church settlements, are yet in existence. During the years from 1844 to 1856, the exclusive system was entirely abolished by all of the Moravian villages in America and their unique character rapidly disappeared. At that period active home mission work was revived and since then many congregations have been founded in various parts of the United States. The most fruitful of these efforts have been in several of the northwestern states.

The Moravian Church has no peculiar doctrines. It is simply and broadly evangelical, in harmony with other Protestant denominations on the cardinal doctrines of Christianity, and bound by no articles on the points of difference. Its only prominent doctrinal feature is the strongly Christ-centred tendency of its teaching which pervades its official statements, its liturgy and its characteristic preaching. The digest ("Results") of the General Synod, the catechisms, and the Easter Morning Litany sufficiently set forth the doctrinal position of the Church. The Church has an established liturgical system, with a litany used regularly on the Lord's Day, and a variety of offices for different church seasons, in which special prominence is given to singing; the cultivation of church music having always been a conspicuous

MORAVIAN SEMINARY—MORDANT

feature of the Moravian cultus. The general order of the ancient church year is observed in the services. Of distinctive services retained by some congregations, the love-feast, introduced in 1727 in imitation of the Agapæ of the Apostolic Church, is the most conspicuous. Moravian orders of the ministry are bishops, presbyters, and deacons. A diocesan episcopacy does not exist. The bishops are, as such, everywhere on a parity, representing the entire *Unitas Fratrum*. They are *ex officio* members of the General Synod and of the Synods of the several provinces in which they reside. Besides having the exclusive function of ordaining men, they are looked to as pre-eminently the guardians of sound doctrine and established order. In governing boards they officiate, not by virtue of episcopal authority, but by election, and those who do not occupy executive positions serve, meanwhile, in pastorates. The Moravian Church in America is divided into a Northern and a Southern Province, constituting, with the British and German branches of the Church, an organic unity under the General Synod. The legislative authority of each Province is the Provincial Synod which elects an Executive Board known as the Provincial Elders' Conference and composed usually of a bishop and two presbyters. The Northern Province is divided into Districts, each organized with its Synod and its Executive Board. The communicant membership of the American Church in 1903 was 16,424 and its total 24,726. The enrolment in the 14 mission provinces of the Church was 98,599 and its grand total in all countries was 138,903, besides 70,000 members of the state churches of Europe, ministered to by Moravian home missionaries.

J. M. LEVERING,
Bishop of the Moravian Church.

Moravian Seminary, at Bethlehem, Pa., founded almost at the beginning of the Moravian settlement of Bethlehem (1741), it is the second oldest girls' boarding school in the United States, the Ursuline Academy, New Orleans (7 Aug. 1727), being the first. "Colonial Hall," built in 1748, is the oldest structure in the group of buildings owned by the Seminary. From the roof of this building it was customary in pre-Revolution days to play the trombone on festal occasions or to announce the death of members. Tradition says that on one occasion during the French and Indian War, a band of Indians had planned to attack the settlement, and at sunset as they lay waiting on Calypso Island, for the darkness, they heard a strange melody floating down from the sky. They had never heard anything like it before, and thinking it must be the voice of the Great Spirit warning them, they held a hurried council, and silently stole away in the darkness. In 1776-8, "Colonial Hall" served as a military hospital for the Continental troops. After the Battle of Brandywine the place was crowded with wounded. On the slope of the hill, just west of Monocacy Creek, are the graves of over 500 of unknown dead. Many of the distinguished women of the nation have graduated at this institution. A preparatory school, music, art, and science departments are connected with the seminary. The average attendance is about 100, the number of teachers 20. (See BETHLEHEM, Pa.) Consult Longfellow's poem, 'Hymn of the Moravian Nuns.'

Moravians. See MORAVIAN CHURCH.

Moray, mŭr'ā, Earl of. See STUART, JAMES, EARL OF MURRAY OF MORAY.

Moray Firth, Scotland, a large bay on the northeast coast, containing at its widest extent the sea enclosed by a line running from Duncansby Head in Caithness-shire to Kinnaird Head in Aberdeenshire. It thus comprises the Dornoch Firth and the inner Moray Firth, the entrance to which lies between Tarbet Ness in Cromarty and Burghhead in Elginshire, and which gives off Cromarty Firth and Beaully Firth and Loch. The opening of the outer firth to the North Sea is 80 miles in width. The rivers which enter the firth include the Deveron, Spey, Findhorn, Ness, Beaully, Oykel, etc.

Mo'rays, eel-like fishes of the family *Muraenidae*. These, says Jordan, may be distinguished by the small round gill openings and the absence of pectoral fins. The skin is thick and tough, the narrow jaws are armed with knife-like or else molar teeth, and the lower one is moved by muscles of extraordinary size and power. They are carnivorous and pugnacious fishes, and some of them, which reach a length of five or six feet, may be dangerous to bathers and fishermen. They abound in the tropics, lurking in the crevices of rocks, coral-reefs, and similar places, and most of them are colored in striking patterns, as fine marblings of black on lustrous green, or varied spottings. Several genera and more than 100 species are known, of which a celebrated type is the murena (*Murana bellina*) of the Mediterranean Sea, which was extensively cultivated by the Romans, in the classic period, for the sake of its flesh. Two or three species are well-known as food-fishes on both coasts of tropical America, and one usually called "conger," is similarly utilized in Southern California.

Morazan, Francisco, frān-sēs'kō mō-rā-sān', Central American soldier and politician: b. Tegucigalpa, Honduras, October 1792; d. San José, Costa Rica, 15 Sept. 1842. He early entered political life and in 1824 was secretary-general of Honduras; when Honduras and Salvador revolted against President Arce of Central America Morazan came rapidly to the front as a military leader and in 1830, after a series of brilliant military exploits, was elected president of Central America. Though a wise ruler his administration was interrupted by several revolts and at the close of his second term it was found that no provision had been made for electing his successor and in spite of his efforts the union of the states of Central America was dissolved and Morazan was compelled to find refuge in Peru. In 1842 he landed in Costa Rica, proclaimed the federation of the states and after defeating Carillo assumed the presidency at San José. A revolution followed and he was captured and shot. Consult Bancroft, 'History of Central America,' Vol. III. (1887).

Mordant, in dyeing, a substance which is capable of penetrating the fibres of the substance that is to be colored, or of forming an insoluble deposit upon them, and which also forms an insoluble compound with the dye that is to be used. Mordants vary greatly in character, according to the nature of the dye and of the fabric. They may be classified, however, as

MORDANTS — MORE

"acid" and "basic"; an acid mordant being required to fix a basic dye, and a basic mordant to fix an acid dye. Tannic acid is a typical example of an acid mordant. Cotton may be mordanted with this substance by soaking it in a solution of tannic acid, and then passing the fabric through a solution of a salt of antimony, tin, or some other suitable base, by which the tannic acid is fixed upon the fibre in the form of an insoluble tannate, with which the dye subsequently combines. The acetates and sulphates of aluminum and of iron may be cited as examples of basic mordants. Wool may be mordanted, for example, by boiling it in a dilute solution of such a salt (usually with the addition of certain other substances such as cream of tartar or oxalic acid), the wool causing the mordant to partially dissociate, so that a more basic compound is deposited upon and within its fibres, while a more acid one remains in solution. Wool, when treated in this way, will fix dyes (such as alizarin) that are of a phenolic character. The precise phenomena that occur in mordanting are not thoroughly understood in all cases. See DYING.

Mordecai, mōr'dē-kī, **Alfred**, American engineer: b. Warrenton, N. C., 3 Jan. 1804; d. Philadelphia 23 Oct. 1887. Graduating at the head of his class from West Point in 1819, he became 2d lieutenant of engineers, and after work as instructor at West Point and assistant engineer was appointed captain of ordnance corps 30 May 1832. He was assistant to the chief of ordnance at Washington 1838-42 and member of the ordnance board 1839-60. Brevetted major (1848) for meritorious conduct in the Mexican War, he was sent to the Crimea (1855-67), his observations on military organization and ordnance being published by order of Congress in 1860. He resigned from the service in 1861, settling in Philadelphia, where, after acting as assistant engineer of the Mexican & Pacific Railroad (1863-6), he became (1867-1887) treasurer and secretary of canal and coal companies controlled by the Pennsylvania Railroad. Among his works are: 'Digest on Military Laws' (1833); 'Reports of Experiments on Gunpowder' (1845-9); 'Artillery for the U. S. Land Service,' as devised and arranged by the Ordnance Board with Plates (1849); 'Ordnance Manual for the Use of Officers of the U. S. Army' (1841 and 1850).

Mordecai, **Alfred**, American engineer, son of the preceding: b. Philadelphia 30 June 1840. On graduating from West Point (1859) he was brevetted 2d lieutenant of topographical engineers. After service on the field (June-August 1861) he taught at West Point for nearly a year, and then was promoted until he became chief of ordnance, Department of the South (1863-4). From May to September 1864 he was chief of ordnance, army of the James, later holding similar office in the army of Ohio, army of the Cumberland and military division of the Tennessee. Brevetted lieutenant-colonel for services in the war (13 March 1865), he was made instructor of ordnance and gunnery at West Point in 1865, serving there until 1869 and again from 1874 to 1881. Since 1899 he has been commander, with rank of colonel, of the Benicia (Cal.) Arsenal.

Mordenite, a native hydrous silicate of aluminum, potassium, sodium and calcium, occurring in small monoclinic crystals, or in small hemispherical concretions with a fibrous structure. It is white, or nearly so, with a vitreous lustre. Mordenite occurs at Morden, N. S., and in western Wyoming.

Mordvins, mōrd'vīnz, a race of people inhabiting European Russia, and belonging to the Bulgaric or Volgaic group. Their chief sources of livelihood are cattle-rearing, hunting, fishing, and bee-keeping. Since the time of the Empress Anna they have been gradually converted to Christianity. Their numbers are estimated at 480,000.

More, mōr, **Hannah**, English moralist: b. Stapleton, near Bristol, 2 Feb. 1745; d. Clifton, near Bristol, 7 Sept. 1833. She was educated in the Seminary in Bristol kept by her elder sisters, and her talents early made her acquainted with Johnson, Burke, Garrick, and other literary men of the period. Her first success was as a dramatic writer. 'The Inflexible Captive'; 'Percy'; and 'The Fatal Captive' were successfully brought out through the patronage of Garrick and her other friends. After the production of the last in 1779 she gave up play writing from religious motives, and devoted herself to writing works of a moral and religious tendency, the diffusion of tracts, and other philanthropic labors. In this new course her talents commanded an extraordinary measure of success. A series of tracts called the 'Cheap Repository,' commenced at Bath in 1795, is said during the first year to have had a circulation between 1,000,000 and 2,000,000 copies. Her 'Strictures on the Modern System of Female Education' appeared in 1799, followed by 'Hints Towards Forming the Character of a Young Princess' (1805); 'Celebs in Search of a Wife' (1809); 'Practical Piety' (1811); 'Christian Morals' (1812); 'Character and Writings of St. Paul' (1815); 'Moral Sketches of the Prevailing Opinions and Manners, Foreign and Domestic, with Reflections on Prayer.' Consult: Roberts, 'Life of Hannah More'; Thompson, 'Life of Hannah More' (1838); 'Correspondence of Hannah More with Zachary Macaulay' (1860); C. M. Yonge, 'Hannah More' (1888); Marion Harland, 'Literary Hearthstones: Hannah More' (1900).

More, **Nicholas**, English colonist: b. England; d. Philadelphia, Pa., 1689. He was a physician and left a promising career in England to come with William Penn to America in 1682. He was from the first prominent in the affairs of the colony, was president of the first assembly in 1682, and in that year presiding judge of the courts of Philadelphia. In 1683 he was clerk of the provincial council and the next year was speaker of the assembly. He was appointed first chief justice of the supreme court of the province in 1684, and in this position incurred the disapproval of the colony and was impeached for having wielded "an unlimited and arbitrary power." He retained the confidence of Penn, however, who appointed him in 1686 one of the five commissioners in control of the government.

More, **Paul Elmer**, American author: b. St. Louis, Mo., 12 Dec. 1864. He was gradu-

ated at Washington University in his native city in 1887, studied later at Harvard and was instructor in Sanskrit there for a year and subsequently at Bryn Mawr for two years. He has published 'The Great Refusal'; 'A Century of Indian Epigrams: chiefly from the Sanskrit of Bhartrihari' (1898); 'The Judgment of Socrates'; 'Life of Benjamin Franklin'; 'Translation of the Prometheus Bound of Æschylus'; etc.

More, Sir Thomas, English statesman and author: b. London 7 Feb. 1478; d. there 6 July 1535. In 1492-4 he studied at Canterbury College, now Christ Church, Oxford, and in 1494 was a student in Lincoln's Inn. At 21 he obtained a seat in Parliament, and distinguished himself with spirit in opposition to a subsidy demanded by Henry VII. After being admitted to the bar he enjoyed great reputation as a pleader. In 1516 he accompanied the commissioners sent to renew the alliance between Henry VIII. and Charles, then archduke of Austria, and showed much ability. In 1518 he published his celebrated political romance 'Utopia.' Cardinal Wolsey pressed him to receive a pension, which he refused as inconsistent with his official duties; but he was induced to accept the place of master of requests. He was shortly after knighted, and taken into the privy-council. In 1520 he was appointed treasurer of the exchequer, and in 1523, at the instance of Wolsey, was elected speaker of the House of Commons. He was joined with Wolsey in a mission to France in 1527 and on his return made chancellor of the duchy of Lancaster. In 1530 he succeeded the cardinal as lord high-chancellor, which office he filled for three years with scrupulous integrity. Unable to acquiesce in the king's wishes respecting his divorce from Catharine of Aragon, he obtained permission to resign the seals. The affront rankled in the mind of Henry, and was further inflamed by his refusal to attend the coronation of Anne Boleyn. An attempt made to implicate him in the practices of Elizabeth Barton altogether failed; and he also perfectly cleared himself of the charge of inducing the king to publish the book against Luther, in which the Pope's authority was held forth—a doctrine now found inconsistent with the intended attack on the Roman See. At length the oath of supremacy being required by act of Parliament Sir Thomas More was cited before the council to take it; and in spite of all attempts of Crammer and others to induce him to compliance, he persisted in a refusal to act in opposition to the dictates of his conscience, was consequently committed to the Tower, and was indicted for treason. After an imprisonment of 12 months, he was brought to trial, and despite his eloquent defense condemned and sentenced to be hanged and quartered. The king altered the sentence from hanging and quartering to beheading, and this act of grace More received with his usual vein of humor. At his execution he deported himself with a great degree of good humor. The news of his death startled Catholic Europe, and British ambassadors were instructed to explain that all was done by due legal process. More's learning was various and extensive; his wit abundant, and his elocution ready and agreeable. He wrote elegant Latin prose and

verse, and a terse and simple English. He is regarded as among the noblest characters of history. The second degree of beatification, that of Blessed, has been conferred on More by the Roman Catholic Church. His English works were published collectively, by order of Queen Mary, in 1557, and his Latin in 1567. Consult: the biographies by Roper (1626, reprinted 1716); Stapleton, 'Tres Thomæ' (1588); Mackintosh, 'Life' (1830-44); Pridgett, 'Life of Blessed Thomas More' (1891); Campbell, 'Lives of the Chancellors' (1845-8).

More'a. See PELOPONNESUS.

Moreau, mô-rô, Gustave, French painter: b. Paris 1826; d. there 19 April 1898. He began his career under the influence of Delacroix, but on going to Rome he chose as his especial subjects of study the fantastic architectural effects of Mantegna and the dramatic composition and sometimes violent poses of Luca Signorelli. His works show the characteristics of these masters and are eminently original both in design and coloring, though little known until the latter days of his life, as he seldom exhibited until he was past forty, or offered his works for sale. On his death he left upward of 800 canvases to the municipality of Paris to form the Musée Moreau. In 1892 he was appointed professor in the Ecole des Beaux-Arts and held the position till his death. His most notable pictures are 'Death and the Young Man' (1865); 'Orpheus' (1867) in the Luxembourg; 'Prometheus' (1869); 'Hesiod and the Muses' and 'The Apparition' the last two in the Luxembourg also.

Moreau, Jean Victor, zhôn vêk-tôr, French general: b. Morlaix Finistère, 11 Aug. 1763; d. Laun, Bohemia, 2 Sept. 1813. His father was a lawyer and the son, apparently against his will, studied law and held a post in the judiciary at Rennes. But at the beginning of the Revolution he entered politics, formed a company of the National Guard and in 1791 was elected lieutenant-colonel of a volunteer battalion which joined Dumouriez in the field. He rose rapidly, replaced Pichegru in 1795 as commander of the Army of the North, and in 1796 was put at the head of the Army of the Rhine and Moselle. His retreat before a superior force after Jourdin's defeat at Würzburg, and his swift movement to the attack again before the truce of Leoben proved him a masterly strategist. Momentarily retired for failure to reveal Pichegru's royalist plot he was recalled in 1799; served under Scherer in Italy and largely recouped his superior officer's losses; succeeded Joubert after that general's death; was Bonaparte's confidant in the *coup d'état* of Brumaire; passed the Danube and the Rhine; defeated the Austrians in a series of brilliant engagements culminating in Hohenlinden; and then with the backing of the royalists attempted to oust Bonaparte. He was found guilty of plotting against Napoleon and was exiled from France for two years, which he spent on a farm in Pennsylvania. He was recalled to Europe by the Allies, served against France in 1813, and was killed at the battle of Dresden.

Morecambe, môr'kâm, England, a Lancashire seaside resort on Morecambe Bay, 4 miles by rail northwest of Lancaster. Its principal

MOREEN — MORETON BAY

features are the promenade pier, observation tower, winter garden, etc., and the fine beach of Morecambe Bay, this inlet of the Irish Sea being about 17 miles long and 10 miles broad. Pop. (1901) 11,798.

Moreen'. See **MOIRE**.

Morel. See **FUNGIL**.

Moreland, William Hall, American Protestant Episcopal bishop: b. Charlestown, S. C., 9 April 1861. He was graduated from the University of the South in 1881 and was assistant rector at Christ Church, Hartford, Conn., in 1884-5. In 1885-93 he was rector at the Church of the Good Shepherd, Nashua, N. H., and in 1893-9 rector of St. Luke's, San Francisco. He was consecrated bishop of Sacramento in 1899. He has published: 'What is Christianity?' (1887); 'The Church or the Churches: Which?' (1894); etc.

Morelia, mō-rā'lē-ā, or **Valladolid**, val-yā-dō-lēd', Mexico, the capital of the state of Michoacan, 125 miles direct, 234 miles by rail, northwest of Mexico City. It is situated at an altitude of 6,400 feet above sea-level, in a valley surrounded by high mountains. The cathedral completed in 1745, the capitol, the Colegio San Nicolas de Hidalgo, and the fine aqueduct dating from 1788 for the supply of water, are among its principal features. It is the centre of one of the chief sugar growing districts in Mexico. The city was founded as Valladolid in 1541; in 1828 it was renamed Morelia in memory of General Morelos, a native and one of the soldiers of the independence. Pop. (1895) 33,890.

Morell, mō-rēl', **George Webb**, American soldier: b. Cooperstown, N. Y., 8 Jan. 1815; d. Scarborough, N. Y., 12 Feb. 1883. He was graduated from West Point in 1835 and served in the engineering corps until 1837 when he resigned and was engaged in railroad construction for three years in the South and West. In 1840 he returned to New York, studied law and was admitted to the bar. He was commissioner of the United States circuit court of southern New York from 1854 until the outbreak of the Civil War when he entered the army and assisted in the organization of volunteer regiments, acting as chief of staff to General Edward S. Sanford, and in Aug. 1861 was given command of a brigade under General Porter in the Army of the Potomac with the rank of brigadier-general. Upon General Porter's promotion Morell was placed in charge of his division; he was engaged in the battles of Malvern Hill, Mechanicsville, Hanover Court-house and Gaines' Mills, and was in command of the forces guarding the upper Potomac in 1862. He had charge of the drafting at Indianapolis in 1863-4, and in the latter year was mustered out of service because of ill-health.

Morelos y Pavon, José Maria, hō-sā' mā-rē-ā mō-rā'lōs ē pā-vōn', Mexican patriot: b. near Apatzingan, Michoacan, 30 Sept. 1765; d. near City of Mexico 22 Dec. 1815. He worked for many years as a muleteer; at 32 entered the college of Valladolid; was ordained to the priesthood three years afterward; and from 1801 to 1810 was in charge of the parishes of Caracuario and Nucupetaro. In 1810 he joined the standard of rebellion raised by Miguel Hi-

dalgo, who had been rector of the college of Valladolid during Morelos' student days, and after Hidalgo's death kept the cause alive in the North by his own vigorous movements in the South. Having defeated several Spanish armies he advanced upon the City of Mexico, defeated Porlier 22 Jan. 1812, successfully held Chautla for 62 days against the famous siege by the viceroy, and captured Oaxaca (October 1812) and Acapulco (August 1813). He was made captain-general in November 1813 by the Congress convened at Chilpancingo, and the declaration of Mexican independence soon followed. He attempted to capture Valladolid, was defeated by Iturbide, was captured, and was shot from the rear as a traitor at San Cristobal Ecatepec. He was an able general and is a popular hero in Mexico, where one state and several districts bear his name.

Morelos, mō-rā'lōs, Mexico, a central state immediately south of the highest volcanic region of the Anahuac plateau, bounded by the states of Mexico, Puebla, and Guerrero; area, 2,774 miles. The country is broken and covered with forests, and is drained by the Mexcala River. Agriculture is in an advanced condition, sugarcane, rice, wheat, maize, and coffee being among the principal products, and fruit being largely exported. The state is traversed by the Inter-oceanic railway. Capital, Cuernavaca. Pop. (1895) 8,747. Pop. of state (1900) 161,697.

Moreno, Alfredo Baquorizo, āl-frā'dō bā-kwō-rē'sō mō-rā'nō, Ecuadorian diplomatist and novelist: b. Guayaquil, Ecuador, 29 Sept. 1859. He was graduated in law from the University of Quito and began the practice of his profession in 1884. From 1897 to 1901 he was a member of the Superior Court of Guayaquil, was minister of foreign relations 1901-2, was elected vice president of Ecuador in January 1903, and is now minister from Ecuador to the United States. He is the author of 'Poetas' (1882); and the novels 'Titania' (1892); 'El Señor Penco' (1892); 'Una Sonata en Prosa' (1894); 'Evangeline' (1895); 'Luz' (1901).

More'pork, a large Australian frog-mouth (*Podargus cuciferi*) which derives its name from its loud two-syllabled call, heard chiefly in the dusk, though the birds are not so nocturnal as are most of their relatives, the night-jars. They are mottled gray in plumage, and have a curious protective habit, when alarmed, of assuming and stiffly keeping attitudes which make them look like mere projections of the dead logs and fence-rails on which they usually sit. These and other habits are fully described by recent writers on the natural history of Australia, especially Saville-Kent. This bird occurs also in Tasmania; but not in New Zealand where the so-called "more-pork" is a small gray owl.

Moreton (mōr'tōn) Bay, Australia, on the east coast of Queensland, formed inside the islands of Moreton and Stradbroke, is 40 miles long by 17 broad; its south half is dotted with islands and sandbanks. It receives the six considerable streams, Nerang, Pimpama, Logan, Pine, Caboolture, and Brisbane, with the important city of Brisbane at its outlet. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between

MORETTO DA BRESCIA — MORGAN

Moreton and Stradbroke Islands is narrow and less safe.

Moretto da Brescia, mō-rēt'tō dā brā'chē-ā, (his proper name was ALESSANDRO BONVICINO), Italian painter: b. Brescia 1498; d. there 1555. He took Titian as his model, imitating also Palma Vecchio and Romanino, whose styles he developed on independent lines of his own. He was already famous as an artist at 18, and reckoned a master of pictorial expression uniting in his coloring tenderness and freshness of flesh tones with a brilliant power of chiaroscuro. His pictures are particularly noted for their bright background, from which his figures stand off with life-like clearness. His numerous religious paintings are full of devotional feeling. Most of these are at his native town of Brescia. In St. Clement's Church in that place is a vast altar piece of his containing a Madonna and Child surrounded by singing angels and the Saints Clement, Dominick, Florian, Catharine, and the Magdalen. He painted an 'Assumption' in the Church of San Mazarò. His masterpiece 'The Virgin Appearing to a Shepherd' is in the church at Paitone, province of Brescia. There are some fine paintings of his in the galleries at Berlin and Frankfurt, and in the Brera at Milan; and examples are to be found also in the public galleries of Vienna, St. Petersburg, and Paris. The portraits by this master are equally excellent in conception and power of coloring.

Morey, mō'ri, Samuel, American inventor: b. Hebron, Conn., 23 Oct. 1762; d. Fairlee, Vt., 17 April 1843. He early evinced a talent for mechanics and engineering and at the time of the opening of the Connecticut River to navigation designed and built the locks at Bellows Falls. On his large estates he built chutes with which to bring his pine logs to the mills years before Napoleon's accomplishment of the feat in the Alps. When but 18 he began his experiments with steam and in 1790 had conceived the idea of propelling boats by means of an improved steam-engine. In 1793 he succeeded in building a boat which attained a speed of four miles an hour and later he improved it and exhibited it in New York with a speed of five miles an hour. Morey was often in consultation with Professor Silliman of Yale College as to the value of his inventions and when Chancellor Robert R. Livingston offered him \$7,000 for the patent allowing him to run the boat from North River to Amboy Morey declined. He continued his experiments, encouraged by an offer of \$100,000 for an eight-hour steamboat which Livingston was said to have made and several patents were issued to Morey indicating that he considered the object almost within his reach. In 1797 he exhibited a greatly improved boat at Philadelphia and became famous throughout the Middle and New England States. His object seemed practically achieved and arrangements were made for the operation of the steamboats when misfortune overtook the capitalists who were to promote the enterprise and it failed of operation. Morey is believed to have been the real inventor of the steamboat by many authorities, as Robert Fulton visited him before the exhibition of his own invention.

Morey Letter, The, in American political history the forgery of a letter during the Garfield-Hancock campaign of 1880. The letter which favored Chinese immigration purported to have been written by Gen. Garfield and to be addressed to H. L. Morey, Lynn, Mass., and was made public in the *New York Truth*, 20 Oct. 1880. James A. Garfield, Republican candidate for President, denounced the letter as a forgery, but Democrats made liberal use of the document and many votes, it is said, were lost to the Republicans through the publication of the letter.

Morgagni, Giovanni Battista, jō-vā'n'ē bāt-tēs'ta mōr-gā'n'yē, Italian anatomist: b. Forlì, 25 Feb. 1682; d. Padua 6 Dec. 1771. After taking his degree of M.D. at Bologna, he went to Venice and ultimately to Padua, where in 1712 he became professor of the theory of physics; and in 1715, as successor of Molinetti, was appointed to the principal anatomical chair in the same institution, which he continued to occupy till his death. He was the first to show the importance of anatomy as being the basis of all other medical studies, and is regarded as the founder of pathological anatomy. His most celebrated works are: 'Adversaria Anatomica' (1719), afterward enlarged and published under the title of 'Adversaria Omnia' (6 vols., 1741); and particularly his 'De Sedi-bus et Causis Morborum per Anatomen Indagatis' (1761; 6 vols., Leipsic, 1827), which has been translated into various European languages.

Morgan, Daniel, American soldier: b. Hunterdon County, N. J., 1736; d. Winchester, Va., 6 July 1802. His early life was passed in obscurity and in 1753 he removed to Virginia where in 1755 he served under Braddock as a teamster. He was afterward engaged in Indian warfare and served in Pontiac's war and in Lord Dunmore's war. In 1775 he entered the army of the colonists and commanded a company of riflemen under Washington. He accompanied Arnold at Quebec in 1775 and rendered gallant service there but was captured by the British and not exchanged until nearly a year afterward. He was then given command of a Virginia regiment with the rank of colonel, and in the campaign against Burgoyne took a prominent part, but his services not being recognized by Congress he resigned. In 1780 he returned to the service as brigadier-general under Gates and under General Greene who succeeded Gates. Morgan won a brilliant victory over Tarleton, which was recognized by a gold medal from Congress. His subsequent movements were of serious annoyance to Cornwallis, but in 1781 he resigned from the army owing to ill health. In 1794 he returned to it as major-general and helped to crush the whiskey insurrection and in 1795-9 was a member of Congress. Consult: Graham, 'Life of General Daniel Morgan of the Virginia Line' (1856); McConkey, 'The Hero of Cowpens' 2d ed. (1885).

Morgan, Edwin Dennison, American politician: b. Washington, Mass., 8 Feb. 1811; d. New York 14 Feb. 1883. He was educated in the public schools, at 17 entered the store of his uncle in Hartford, Conn., and three years later was made a partner in the business. In

MORGAN

1836 he removed to New York and engaged in the grocery business. Elected to the State senate in 1850 continued in that office until 1858 when he was elected governor of the State and served until 1862, his administration during those trying times being marked by great sagacity and patriotism and New York's firm attitude during the war may be traced in a large measure to Governor Morgan's influence. In 1862 he was elected to the United States senate but in 1865 declined the secretaryship of the treasury offered him by President Lincoln. He served in the Senate until 1869 and though still taking an active interest in politics held no further political office excepting that of chairman of the Republican committee which conducted the presidential campaign of General Grant in 1872. He was connected with numerous great financial enterprises during the last years of his life and was a generous benefactor of various colleges, etc.

Morgan, Sir George Osborne, English politician: b. Gothenburg, Sweden, 8 May 1820; d. 1897. He was graduated at Oxford in 1848, and was admitted to the bar in 1853. In 1868 he became a member of the House of Commons and was a staunch supporter of various reform movements, particularly those concerning the English land laws, religion and education. He was appointed judge-advocate in Gladstone's cabinet in 1880 and in 1886 was under secretary for the Colonies. He was made a baronet in 1892 and was leader of the Welsh party in the House of Commons until his death.

Morgan, George Washbourne, American organist: b. Gloucester, England, 9 April 1822; d. Tacoma, Wash., 10 July 1892. When he was 8 he played the entire service at St. Nicholas' Church in Gloucester and at 12 became assistant organist at the cathedral there. He removed in 1853 to New York, where he was organist in several leading churches, and gave recitals in different cities of the United States with marked success. He conducted an annual Lenten service in Chickering Hall, New York after 1880 and was the author of an Episcopal service, and numerous other compositions.

Morgan, George Washington, American soldier: b. Washington County, Pa., 20 Sept. 1820; d. Fortress Monroe, Va., 27 July 1893. He left college in 1836 to enlist in the Texas army and fought for the independence of that country as lieutenant and then as captain when he resigned and in 1841 entered West Point. In 1843 he left the academy to study law and established a law practice at Mount Vernon, Ohio, in 1845. When the Mexican War broke out he became colonel and served under General Scott with distinction, becoming brigadier-general. He returned to his law practice and in 1856 was sent as United States consul to Marseilles; in 1858 he went from there to Portugal as minister where he remained until 1861. He entered the army immediately upon his return to United States and as brigadier-general was given a command under General Buell. In 1862 he took command of a division of the Army of Ohio and later was with Sherman at Vicksburg. He was compelled to resign in 1863 on account of failing health. He

afterward entered political life and was elected to Congress in 1866 and in 1870.

Morgan, Sir Henry John, Welsh buccaneer, lieutenant-governor of Jamaica: b. Llanrhynny, Glamorganshire, about 1635; d. Jamaica 1688. While a boy he was kidnapped at Bristol and sold at Barbados. Just when he joined the Jamaica buccaneers is uncertain, as there were several Morgans in the Marine at Jamaica at the time, but he may have commanded his own ship as early as 1663; a Captain Morgan who sailed from Jamaica in that year taking part in the sack of Vildemos, Truxillo, and Granada (1665-6). In 1666 Morgan sailed under Mansfield to capture Curaçao and was chosen admiral after Mansfield's death at the hands of the Spanish. In 1668 he captured Puerto Principe to get information of Spanish plans for an attack on Jamaica; then took Porto Bello, Panama, after a sharp siege during which the buccaneers planted scaling ladders under the cover of captured priests and nuns, sacked the city, and tortured and maltreated its inhabitants; and in the end of the summer again ravaged Cuba. The next year, 1669, saw Morgan's attack on Maracaibo in March, followed by fresh outrages. The arrival of three Spanish warships did not check Morgan's success, for he set fire to one ship, captured another, and forced the Spaniards to beach and burn the third; he killed almost all his prisoners, recovered 15,000 pieces of eight from the sunken ship, got a ransom for the city from the Spanish forces in the fort, and by a clever maneuver made his escape. Returning to Jamaica he was first reproved for exceeding his powers, and then made commander-in-chief of the entire naval force of Jamaica, so that in 1671 with a stronger force under him than before he approached the city of Panama, which he captured after a thrilling battle, in which the Spanish cavalry was broken by riding into a swamp, and further execution was done by a herd of cattle which the Spaniards intended should break the English ranks but which stampeded the Spanish. This attack and capture of Panama was some time later than the signature of peace between England and Spain, so that Morgan was ordered to England for trial in 1672. Nothing serious came of this, however, possibly because Morgan made free use of his wealth in England, and in November 1674 he was commissioned lieutenant-governor of Jamaica, where his after life was uneventful and his administration apparently excellent. He can hardly be called a pirate; his cruel, brutal methods were those of his enemies and England's enemies. The primary source for Morgan's life is Exquemeling, 'Buccaneers of America' (1648), the work of one of Morgan's followers. Professor J. K. Laughton in the 'Dictionary of National Biography,' Vol. XXXIX. (1894), first set straight the chronology of Morgan's life. Popular accounts are Hutcheson, 'Sir Henry Morgan' (1890); Pyle, 'Buccaneers of America' (1891); Stockton, 'Buccaneers and Pirates of Our Coast' (1898); and Brady, 'Sir Henry Morgan,' a romance (1902).

Morgan, James Appleton, American lawyer and author: b. Portland, Maine, 2 Oct. 1850. He was graduated at Racine College, Wisconsin, in 1867, and at the Columbia Law

JOHN TYLER MORGAN.
U. S. SENATOR FROM ALABAMA.

MORGAN

School in 1869, and in 1871 began the practice of law in New York city, becoming professionally associated with railroad interests. In 1885 he founded the Shakespeare Society of New York, of which from the first he has been president. Its publication, the 'Bankside Edition of Shakespeare' (20 vols., 1888-92), was edited by him. In this and in various other works he maintained a theory, based upon collation of the oldest texts, of the composite character of the Shakespeare plays, and of their development under many hands after Shakespeare's original presentation of them. His writings include: 'Macaronic Poetry' (1870); 'The Law of Literature' (1874); 'Legal Maxims' (1877); 'The Shakespearean Myth' (1880); 'Shakespeare in Fact and Criticism' (1884); 'Some Shakespearean Commentators' (1885); 'Digesta Shakespeareana' (1887); 'The People and the Railways' (1888); and 'The Society and the Fad' (1890).

Morgan, John Hunt, Confederate general: b. Huntsville, Ala., 1 June 1826; d. Greenville, Tenn., 4 Sept. 1864. He removed with his parents to Lexington, Ky., in boyhood. He was a 1st lieutenant of cavalry in the Mexican War; afterward a manufacturer in Lexington. In the Civil War he became a major-general in 1862, and the next winter commanded a cavalry force under Bragg which harassed Rosecrans' communications. Leaving the regular service, he organized a guerrilla band which inflicted enormous damage in Kentucky. In June 1863 he began a gigantic raid through Kentucky, Indiana, and Ohio, but was brought to bay and routed, finally captured, and imprisoned in the Ohio Penitentiary. He escaped, and headed a fresh raid in Tennessee; but was betrayed at a farm-house, surrounded in the night, and killed while attempting to escape. Consult: Duke, 'History of Morgan's Cavalry' (1867); Johnson and Buel (editors), 'The Battles and Leaders of the Civil War' (1887). See MORGAN'S RAID INTO INDIANA AND OHIO.

Morgan, John Pierpont, American financier: b. Hartford, Conn., 17 April 1837. He is the son of J. S. Morgan (q.v.). He was educated at the English High School in Boston, and at the University of Gottingen, Germany. He began his business career in the banking house of Duncan, Sherman & Co., New York city; in 1860 he became agent and attorney in the United States for George Peabody & Co. of London; in 1864 junior member of the banking firm of Dabney, Morgan & Co., and later member of the firm of Drexel, Morgan & Co., of which his father was also a partner. By the death of the older members of the firm he became the head of the latter house, and the firm name was changed to J. P. Morgan & Co. He also controls the firm of J. S. Morgan & Co. of London, and has a partnership interest in Drexel & Co. of Philadelphia. For many years his chief interest lay in railroad negotiations and combinations, and he has gradually gained control of the New York Central system, the New York, New Haven and Hartford, the Reading, the Erie, the Lehigh Valley, the Southern, the Northern Pacific, the Big Four, and the Chesapeake and Ohio. Shortly after this great railroad consolidation was completed (1901), he succeeded in organizing the "United States Steel Com-

pany," uniting the Carnegie Steel Works and other large concerns with a capitalization of \$1,100,000,000, and dominating the steel industry of the United States. In the same year he bought up a large English shipping line with the evident design of organizing a trust for the control of transatlantic shipping; but has not succeeded in completing the consolidation. He is the head of both the anthracite and the soft coal trusts, and has several times been prominent in the settlement of miners' strikes. In 1895 he organized the syndicate which floated the United States bond issue of \$62,000,000, for the increase of the gold reserve; and in 1901 secured American subscriptions of \$50,000,000 to the British war loan. Probably no other American capitalist is so well known and so thoroughly trusted in Europe as Mr. Morgan; particularly is this true as regards England, and a large majority of English investments in American securities are made through his house; everywhere he is recognized, not merely as a man of vast wealth, but also as a man of unusual organizing and constructive ability. He has given largely to many charities and institutions, particularly to hospitals, churches, and the Trade School in New York, and to Harvard University. He is an enthusiastic yachtsman, was for two years commodore of the New York Yacht Club, and built the yacht Columbia which defeated Sir Thomas Lipton's Shamrock in the international yacht races.

Morgan, John Tyler, American lawyer and politician: b. Athens, Tenn., 20 June 1864. He went to Alabama when nine years old, received his education there, was admitted to the bar in 1845, and commenced the practice of his profession. He rapidly gained a high reputation as a lawyer and speaker; was presidential elector in 1860, voting for Breckinridge; and in 1861 was a delegate to the Alabama Convention which declared for secession. He enlisted in the Confederate army as a private in 1861; in 1862 raised a regiment in his State, of which he was made colonel; and in 1863 was commissioned brigadier-general and commanded a division under General Johnston. After the war he resumed the practice of law at Selma, Ala., was presidential elector on the Democratic ticket in 1876; and in 1877 was elected to the United States Senate. He has been four times re-elected in 1882, 1888, 1894, and 1900; in the latter year there was no opposing candidate and he received the unanimous vote of the Alabama senate and house. He has long been recognized as one of the ablest leaders of the Democrats in the Senate, has been a member of the Senate committee on foreign relations, and for some years its chairman; in his last term he was chairman of the committee on interoceanic canals; and favored the Nicaragua canal route instead of the Panama, so that November 1903 he was removed from that post. He was an earnest and able advocate of recognition of Cuban independence and won popularity in all parts of the country by his eloquent speeches in behalf of Cuba. In 1892 he was appointed by President Harrison one of the board of arbitration on the Bering Sea Fisheries; and in 1898 was one of the commission appointed by President McKinley to prepare a system of laws and organize the government for the Hawaiian Islands.

MORGAN — MORGAN CITY

Morgan, Junius Spencer, American financier: b. West Springfield (now Holyoke), Mass., 14 April 1813; d. Monte Carlo, Monaco, 8 April 1890. He entered a dry-goods store when a boy and remained there until he came of age when he was engaged for 18 months in banking in New York. He returned to the dry-goods business in Hartford, Conn., where he was junior partner in a leading firm and rapidly advanced until he formed a partnership under the name of J. M. Beebe, Morgan & Co., which became one of the largest dry-goods establishments in the United States. In 1854 he was a member of the banking house of George Peabody & Co., in London, which subsequently became J. S. Morgan and Co., and was ranked among the world's greatest banking houses. He was a generous benefactor of various public and private institutions, among them being Trinity College, Hartford, and the Hartford Orphan Asylum. He established a public library in Hartford, and made valuable donations to the Metropolitan Museum of Art, Yale College, etc.

Morgan, Lewis Henry, American archaeologist and anthropologist: b. Aurora, N. Y., 21 Nov. 1818; d. Rochester, N. Y., 17 Dec. 1881. He was graduated at Union College in 1840; practised law at Rochester in 1844-64; and served in the State assembly (1861) and senate (1868-9). His earliest work, 'The League of the Iroquois' (1851), was the first scientific account of the organization and government of an Indian tribe; but even more valuable are his 'Systems of Consanguinity and Affinity of the Human Family' (1869), and his treatise on 'Ancient Society' (1877), each based on the same material, the former being a collection of facts, the latter a philosophical treatise. He also published 'The American Beaver' (1868), and 'Houses and House-life of the American Aborigines' (1881). In 1875 he was elected to the National Academy of Sciences, and 1879 was president of the American Association for the Advancement of Science.

Morgan, Matthew Somerville, American artist: b. London 27 April 1839; d. New York 2 June 1890. He studied scene painting, but soon abandoned it to become correspondent and illustrator for the London 'News,' afterward studying in Paris, Italy, and Spain, and in 1858 penetrated the interior of Africa on a sketching tour. Returning to London he became joint editor and proprietor of the 'Tomahawk' and his cartoons which audaciously attacked the aristocracy and royalty brought him into disfavor. He assisted in the establishment of the London 'Fun' and in 1870 removed to United States where he was engaged with Frank Leslie. He managed several theatres in New York, managed the Strobridge Lithograph Company of Cincinnati in 1878-85 and founded in that city the Matt Morgan Pottery Company and the Art Students' League.

Morgan, Sydney Owenson, LADY, Irish novelist: b. Dublin, Ireland, about 1780; d. London, 14 April 1859. Her father was an actor on the Dublin stage, of the name of Mac Owen, afterward changed to Owenson. Her first literary effort was a volume of poems (1801), followed by a collection of Irish songs, and two novels, 'St. Clair,' and the 'Novice of St. Dominick.' In 1806 appeared her 'Wild

Irish Girl,' a novel which became immediately popular, and secured for her a high position in fashionable and literary life. She had by this time removed from Dublin to London, and in 1812 was married to Sir Charles Morgan, an eminent physician. Among other writings by Lady Morgan are the novels 'O'Donnell,' 'Florence Macarthy,' and 'The O'Briens and The O'Flahertys'; the 'Life and Times of Salvator Rosa'; 'Woman and her Master'; and 'Passages from my Autobiography.' Consult Fitzpatrick, 'Lady Morgan' (1860).

Morgan, Thomas J., American lawyer and Socialist leader: b. Birmingham, England, 27 Oct. 1847. He worked at the machinist's trade for 37 years, and has been active in the labor movement since 1875; in 1895 he was graduated from the Chicago Law College, and has since practised law. He was one of the committee appointed to secure the location of the World's Fair at Chicago; and also represented the labor organizations before a Congressional committee, requesting that the Fair be open on Sunday. He was for several years a member of the Socialist Labor Party, and in 1891 that party's nominee for mayor of Chicago. At the time of the formation of the Social Democratic Party (later re-organized as the Socialist Party) he was active in the work of organization, and has since been a prominent member of the party, being secretary of their national campaign committee in 1900, candidate for State's attorney in Cook County, Ill., in 1900, delegate to the national convention at Indianapolis in 1901, and candidate for city attorney in Chicago in 1903. He was also one of a committee of 100 selected by the Civic Federation to recommend reforms in Chicago public schools; and presented the Socialists' view of the trust before the Trust Conference held at Chicago.

Morgan, William, American Freemason, whose death was the immediate cause of the formation of the Anti-Masonic party: b. Culpeper County, Va., about 1775; d. possibly near Niagara in 1826. He fought in the defense of New Orleans in 1815; removed to York, Canada, in 1821, where he became a brewer, and whence soon after he moved to Batavia, N. Y., and in August 1826 disappeared soon after a rumor had been spread that he was to reveal the secrets of the Masonic Order. He was supposed to have been abducted by fellow Masons and drowned in Lake Ontario, but his death was never proved. A corpse found near the mouth of Niagara River was stated to be his; much political capital was made of this "proof"; and Thurlow Weed, a leader in the anti-Masonic movement (see ANTI-MASONS), cynically said that it was "a good enough Morgan till after election," a remark that has become proverbial of campaign deceit. Morgan's book 'Illustrations of Freemasonry, by One of the Fraternity Who Has Devoted Thirty Years to the Subject' (1826) roused much less excitement than the story of his death. Consult: Greene, 'The Broken Seal' (1870); Morris, 'History of the Morgan Affair' (1852); O'Reilly, 'American Political Anti-Masonry' (1879).

Morgan, Fort. See FORT MORGAN.

Morgan City, La., city, port of entry, in Saint Mary's Parish; on the Atchafalaya

MORGAN THE FAY — MORGAN'S RAID

Bayou, and on the Southern Pacific Railroad; about 70 miles west by south of New Orleans, and 20 miles from the Gulf of Mexico. The place was formerly known as Brashear City. The Atchafalaya Bayou is navigable for steamers of light draught, and as it connects Grand Lake and the Gulf, Morgan City has steamer connections inland for some distance and with the principal Gulf ports. Considerable sugarcane is cultivated in the country around Morgan City. The chief industrial interests are connected with the cultivation of sugarcane, rice, and with market gardening, fish, and oysters. It has Onconta Park in which are botanical gardens and a fine zoological collection. On 23 June 1863 a Confederate force of 3,000 soldiers under Richard Taylor captured the Federal garrison of about 1,000 soldiers. The Confederates secured property to amount to \$2,000,000; but they soon abandoned the city, and the Federals again took possession. Pop. (1890) 2,291; (1900) 2,332.

Morgan The Fay, in Celtic tradition and in the Arthurian legend, the sister of King Arthur, to whom by a magic draught she revealed the perfidy of Lancelot. In the legend of Ogier the Dane (Holgar Danske), she bestows eternal youth on Ogier. She appeared also in Italian poetry as one gifted with magical powers; and thence is derived the name Fata Morgana (q.v.) as applied to the phenomenon visible in the Straits of Messina. Consult: Rhys, 'The Arthurian Legend' (1887); Paton, 'Studies in the Fairy Mythology of Arthurian Romance' (1903); William Morris, 'Ogier the Dane' in 'The Earthly Paradise.'

Morganatic Marriage. See MARRIAGE and DIVORCE.

Morganfield, Ky., city, county-seat of Union County; on the Illinois Central Railroad; about 30 miles southwest of Evansville, Ind. It is in an agricultural region, in which tobacco is an important product. The principal industrial establishments are tobacco factories, flour mills, carriage factories, brick yards, and lumber mills. It is the seat of Saint Vincent's Academy (R. C.). The city owns and operates the waterworks. Pop. (1890) 1,094; (1900) 2,046.

Morgan's Raid into Indiana and Ohio. In the middle of June 1863 Gen. Bragg ordered Gen. John H. Morgan, with 2,000 picked mounted infantry and four guns, to move from Tennessee into Kentucky, break up the railroad upon which Gen. Rosecrans depended for supplies, capture Louisville, destroy the public works, and return to Tennessee as quickly as possible. Morgan determined to exceed his orders and make a raid north of the Ohio. On 2 July, with 2,460 men and four guns, he set out from Burkesville, crossed the Kentucky River in the face of Union troops guarding it, and marched northward, followed by all the Union detachments within immediate call. He passed through Columbia, after a sharp skirmish with about 300 of Wolford's Kentucky cavalry, in which he lost about 40 in killed and wounded, and on the 4th reached Green River at Tebb's Bend, and demanded the surrender of Col. O. H. Moore, who, with about 300 men of the 25th Michigan, was guarding the bridge at that

point. Moore replied that the Fourth of July was not a good day to surrender, and was instantly attacked with artillery and musketry. After a hard fight of three hours, in which Moore had 6 killed and 23 wounded, Morgan was repulsed, with a loss of 36 killed and 46 wounded, and drew off, crossing the river below the bridge. On the 5th he defeated and captured the small garrison of Lebanon and marched by Bardstown to Brandenburg, on the Ohio, where he arrived on the morning of the 8th, and seizing two steamboats began crossing his command. His passage was disputed by a gunboat and by militia with a field-piece on the Indiana shore, but by the morning of the 9th his whole command was in Indiana. Twenty-four hours later Gen. Hobson, with 2,500 cavalry and mounted infantry and four guns, crossed the river in pursuit, and for 17 days hung upon Morgan's heels. Indiana and Ohio were aroused and turned out their militia by thousands. After crossing the Ohio Morgan rode north through Corydon, where he was resisted by militia, who were soon overpowered. He then pushed on to Salem, where he captured nearly 400 militia, then through Lexington and Paris to Vernon, near which place on the evening of the 11th he encountered a stiff resistance from about 1,200 militia under Col. Love. Under cover of darkness he withdrew from Love's front, and pressing on through Dupont and Sumansville, crossed the Indiana line on the 13th to Harrison, Ohio, and concentrated his command preparatory to making his way across the Ohio into Kentucky, detaching parties to burn bridges and confuse the pursuit, and impressing fresh horses. Under cover of a feint on Hamilton he marched by night a few miles north of Cincinnati, moving directly east, closely pursued next day by Hobson, who was marching 40 miles a day, and threatened from all directions by the militia. Turning toward Berlin, where the government had a large number of animals, he was confronted by a small body of militia, under Col. Runkle, lost much precious time in threatening an attack, drew off, closely followed by Runkle, and after dark of the 18th reached the banks of the Ohio, a short distance above Pomeroy, near Buffington Bar and Blennerhassett's Island, where from the first he had planned to escape. His pursuers were closing in on him from every direction. On the west Hobson was hanging on his rear; Gen. Judah, who had been withdrawn from Kentucky, had landed his division at Portsmouth, and was marching up from the southwest; regiments were coming down the river from Parkersburg; and gunboats patrolled the river and watched the fords. Early in the morning of the 19th Morgan endeavored to cross the river, but was speedily checked. He was attacked in rear by the head of Hobson's column, Judah's cavalry struck him in flank, and two gunboats opened upon his front. A severe engagement cost him about 120 killed and wounded, and more than 700 of his officers and men surrendered, Morgan with the remainder escaping up the river, where he attempted to cross to Belleville by swimming his horses. Three hundred men, under Col. Johnson, had crossed when a gunboat stopped the remainder of the column, Morgan himself returning to the Ohio shore and with about 800 men retreating inland. He had lost all his artillery and trains. He pressed on

MORGANTOWN—MORI ARINORI

northeast through Athens and Washington, marching 35 miles a day, burning bridges behind him, with Gen. Shackelford and 500 men close upon his rear and skirmishing with it. Near Salineville on the 26th Shackelford's advance captured 250 men, and later in the day he was intercepted near New Lisbon and Beaver Creek, and surrendered with 364 officers and men. The Union loss in the campaign July 2-26 was 19 killed, 47 wounded, and 8 missing. Consult: 'Official Records, Vol. XXIII.; Duke, 'History of Morgan's Cavalry'; Senour, 'Morgan and His Captors'; The Century Company's 'Battles and Leaders of the Civil War,' Vols. III. and IV.

E. A. CARMAN.

Mor'gantown, N. C., town, county-seat of Burke County; on the Southern Railroad; about 80 miles west of Salisbury. In the vicinity are gold deposits. It has lumber and cotton mills, flour mills, machine-shops, and tanneries. It is the seat of the North Carolina School for the Deaf and Dumb and of the State Hospital for the Insane. It is a favorite health resort for people threatened with pulmonary diseases. Pop. (1890) 1,557; (1900) 1,938.

Morgantown, W. Va., city, county-seat of Monongalia County; on the Monongahela River, and on the Baltimore & Ohio and Morgantown & Kingwood R.R.'s; 100 miles south of Pittsburgh, near the northern boundary of the State, eight miles south of Mason & Dixon's line; lat. 39° 38' N.; lon. 2° 39' W. of Washington.

The first settlement was made in 1806 by Nicholas Decker; soon followed by the Morgan family, from whom it takes its name. It was incorporated in 1838 and chartered as a city in 1901. It is in a region noted for its extensive coal fields, and good water-power, which is used for manufacturing. In the vicinity are large forests, oil fields, glass-sand deposits, and limestone. The chief industrial establishments are, factories (1903), window glass, which employ 500 persons; tumbler glass, 700 employees; wire glass, 200; pressed prism glass, 100; a mirror factory, 75; foundry works, 20; publishing company, 30; utility works, 100; brick works, 40; and other small manufactories. There is considerable trade in coal, coke, oil, live-stock, manufactured articles, and agricultural products. The five banks have a combined capital of \$510,000, and deposits amounting to \$1,500,000. It is the seat of the State University, which in 1903 had 800 students, and of the Military and Agricultural Colleges in connection with the State University. There are good public schools, secondary and elementary, 1,100 pupils in attendance. There are a number of good church buildings, the finest is the Methodist Episcopal, a stone building which cost \$100,000.

The government is vested in a mayor, recorder, council of 11 members (the mayor and recorder are included in the council), elected by the people of the four wards. The population includes the following nationalities: American, white, 8,000, colored, 200; German, 400; French, 125; Belgian, 75; Italian, Slav, and others, 250. Pop. (1890) 1,011; (1900) 1,895; (1903) 9,050.

J. FRANK NELSON,
Editor 'Morgantown News.'

Morgarten, mör-gär'tën, Switzerland, a hill two miles west of Rothenthurm, on the margin of the lake of Egeri, on the confines of the canton of Zug, memorable as the scene of the battle of 15 Nov. 1315, in which a small body of Swiss mountaineers from Schwytz, Uri, and Unterwalden, ill armed and undisciplined, totally vanquished an Austrian army of 20,000 under the archduke Leopold, sent by Frederick the Fair to avenge the seizure of the Abbey of Einsiedeln the previous year. This was the first victory achieved by the Swiss in their struggle for freedom. A chapel stands at the foot of the hill, in which service is performed annually on the anniversary of the battle.

Morghen, Raffaello, rä-fä-él'lō mör'gën, Italian engraver: b. Florence 19 June 1758; d. there 8 April 1833. He received his early instruction in his art from his father Filippo and his uncle Giovanni Elia, and was afterward placed as a pupil under the celebrated Volpato, whom he assisted in engraving the pictures of Raphael in the Vatican. The print which represents the miracle of Bolsena is inscribed with his name. He settled in Florence about 1793 as professor of copper-plate engraving in the academy of art. Here the grand-duke employed him to engrave Leonardo da Vinci's 'Last Supper,' which is painted on the wall of the refectory in the Dominican convent at Milan. This picture is faded and effaced, and the drawing which was made from it for Morghen was by no means worthy of the original; so that, though the engraver has given to the world an admirable print, he has failed in giving a correct idea of the work of Leonardo. In 1803 he was chosen an associate of the French Institute; and in 1812 was invited to Paris by Napoleon, who treated him with flattering kindness. Among the most remarkable of the other numerous works of Morghen may be noticed the 'Transfiguration' from Raphael; a 'Magdalen' from Murillo; a 'Head of the Savior' from Da Vinci; the 'Car of Aurora' from Guido; the 'Hours' from Poussin; the 'Prize of Diana' from Domenichino; the 'Monument of Clement XIII.' from Canova; 'Theseus vanquishing the Minotaur'; portraits of Dante, Petrarch, Ariosto, Tasso, etc.

Morgiana, mör-gi-ā'na, a female slave figuring in 'Ali Baba and the Forty Thieves,' a story in the 'Arabian Nights Entertainment' (q.v.).

Morgue, mōrg, a place or building in large cities where the bodies of unknown persons who have perished by accident, murder, or suicide are exposed, that they may be recognized by their friends. If not claimed after remaining three days they are buried.

Mori Arinori, mō-rē ā-rē-nō-rē, Japanese statesman: b. Satsuma 1848; d. 11 Feb. 1889. He was educated in England; as *chargé d'affaires* in Washington arranged the postal convention between Japan and the United States; served as plenipotentiary in Peking and in London; and was minister of education from 1885 to his death. He was an extremely cultured man, with progressive educational ideas. On the day of the proclamation of the Japanese constitution he was assassinated by a Shinto

MORIAH—MORLAND

fanatic for violating a shrine at Ise by lifting the curtain with his walking stick.

Moriah, mō-rī'a, Palestine, the hill on which the temple of Jerusalem was built (2 Chron. iii. 1), and by many authorities believed to be the mount on which Abraham was commanded to sacrifice his son Isaac (Gen. xxii. 2).

Morichi, a palm. See **MURICHI**.

Morillo, mō-rēl'yō, **Pablo**, Spanish general: b. Fuente de Malva, Spain, 1777; d. Madrid, Spain, 27 July 1838. He enlisted in the navy in 1797 and was engaged at Trafalgar in 1805, but when the French invaded Spain left the navy to enter the army and rose to the rank of major-general in 1814. In 1815 he was sent to South America to subdue the revolution in Venezuela and Colombia and after varying fortunes, during which he made for himself a name as a cruel and tyrannous general, perceiving defeat to be inevitable, he asked to be relieved but was compelled to sign a truce with the victorious Bolívar before sailing for Spain. He was appointed to command the garrison at Madrid and in 1822 became captain-general of Galicia which he surrendered to the French. He retired in disgrace to Rochefort, France, but returned to Spain in 1832. During his exile in France he published his 'Mémoires' (1826).

Morin, Arthur Jules, ār-tūr zhūl mō-rān, French mathematician and engineer: b. Paris 19 Oct. 1795; d. there 7 Dec. 1880. He was educated at the Ecole Polytechnique in Paris and at the Ecole d'Application at Metz, and was for a time professor of mechanics in the latter institution. In 1819 he became lieutenant in a battalion of engineers and later accepted a professorship at the Conservatoire des Arts et Métiers in Paris of which he became director in 1847. He held the rank of general in the army and was a member of various military boards, and his researches and inventions were of great scientific value. He published: 'Aide-Mémoire de Mécanique pratique' (1838); 'Salubrité des Habitations' (1874); etc.

Morioka, mō-rē-ō'kā, Japan, a town in the island of Honshū, 40 miles from the coast, and connected by rail with Tokyo. It is the capital of the Prefecture of Iwate, in the northerly province of Rikuchin, has manufactures of silk, copper and other ware, and a trade in fruit, vegetables, etc. Pop. (1898) 32,089.

Morison, George Shattuck, American civil engineer: b. Bedford, Mass., 19 Dec. 1842; d. New York 1 July 1903. He was graduated from Harvard in 1863 and was admitted to the bar of New York in 1865. In 1867-73 he was engaged in engineering in Kansas, Michigan, and Indiana, and then returned to New York which he thereafter made his headquarters. He was an expert on railroad conditions and made himself famous as a bridge builder; constructing five bridges across the Missouri and ten over the Mississippi, the greatest of these being the bridge at Memphis, Tenn., which has a single truss span of 790 feet and is surpassed by only two bridges in the world. He was a valuable member of the Isthmian Canal commission appointed by President McKinley in 1898.

Morison, James Augustus Cotter, English biographer and essayist: b. London 1832; d. 26 Feb. 1888. He was educated at Oxford, was

a Positivist in philosophy, and one of the founders of the 'Fortnightly Review.' He wrote 'Life and Times of St. Bernard' (3d ed. 1877); 'Lives of Gibbon, Macaulay, and Madame de Maintenon'; 'The Service of Man: An Essay toward the Religion of the Future' (2d ed. 1887); etc.

Morison, Robert, Scottish botanist: b. Aberdeen, Scotland, 1620; d. London 10 Nov. 1683. He was graduated from the University of Aberdeen in 1638 but having borne arms as a royalist in the civil war, was obliged to take refuge in France when the cause of Parliament triumphed, and took the degree of doctor at Angers in 1648. From 1650 to 1660 he was superintendent of the garden formed at Blois by Gaston, duke of Orleans. After the Restoration he was appointed by Charles II. one of his physicians and botanist royal, and in 1669 became professor of botany at Oxford. His strong point as a botanist was in classification. His chief work is 'Oxford Universal History of Plants' (1680). Consult: Pulteney, 'Sketches of the Progress of Botany' (1790); Tournefort, 'Eléments de Botanique' (1797).

Morland, mōr'lānd, **George**, English painter: b. London 26 June 1763; d. there 29 Oct. 1804. His father, himself a painter, gave the boy a severe early training in art, and his proficiency was such that his productions found ready purchasers, while at 16 he exhibited in the Royal Academy and became famous as a copyist of Dutch interiors. Soon after he rebelled against the strict discipline of his father's house, and entered upon a career of dissipation, supporting himself, meanwhile, by the pictures which he painted with amazing facility. In 1786 he took up his residence at Kensal Green, where he changed his mode of life and married the sister of James Ward, the animal painter, and William Ward, the engraver. Here he worked hard, and the moral subjects, after the manner of Hogarth, which he favored at this period, were engraved, and became very popular. Soon again, however, he drifted back into his old habits, and, as his pictures were eagerly sought by the dealers, he was able for some time to carry on his reckless career. At length, in 1799, he was arrested for debt, but "obtained the rules of the Bench," took a house within the bounds, and continued to practise his art up to his release in 1802. The art of Morland is characterized by a picturesque representation of rural life in its homelier aspects, his rustic story being always happily conceived and skilfully told. He is one of the first genre and animal painters of the English school. Six of his best paintings are in the Kensington Museum, and the 'Farmhouse Stable' in the National Gallery is sometimes considered his masterpiece. The New York Historical Society possesses his 'Old English Sportsman' and 'Dogs Fighting' and the Metropolitan Museum the 'Midday Meal' and 'Weary Wayfarers.' Consult Dawe, 'Life of Morland' (1807).

Morland, Sir Samuel, English inventor and diplomat: b. Sullhamstead-Banister, Berks, 1625; d. Hammersmith 30 Dec. 1695. He studied at Winchester School and at Magdalen College, Cambridge; was a tutor at Cambridge in Pepys' day; and about 1650 devoted himself to diplomacy. Cromwell sent him to Sweden in

MORLEY — MORMONS

1653; and in 1655 to the Duke of Savoy, to protest against the persecution of the Waldensians, in whose history he became deeply but none too intelligently interested, his 'History of the Evangelical Churches of the Valley of Piedmont' (1658) being full of exaggeration and misinformation. He was close in the secrets of Cromwell, and upon learning of Sir Richard Willis' plot against Charles revealed it to that prince; and was rewarded after the Restoration with a baronetcy. He then withdrew from public life, devoted himself to mechanical experiments, improved the fire pump or fire engine, the lineal predecessor of the steam engine, and invented a speaking trumpet and other nautical instruments. He wrote on cryptography, mathematics, and mechanics.

Morley, mór'li, Edward Williams, American chemist: b. Newark, N. J., 1838. He was graduated from Williams College, Williamstown, Mass., in 1860. He was elected to the chair of chemistry in Western Reserve College, Hudson, Ohio (later Adelbert College, Cleveland), in 1869 and has retained the office. He was also professor of chemistry at Cleveland Medical College in 1873-88 and he has been connected with various scientific societies. He is the inventor of an improved apparatus for gas analysis and has published: 'Atomic Weight of Oxygen' (1895).

Morley, Henry, English author: b. Hatton Garden, London, 15 Sept. 1822; d. Carisbrooke, Isle of Wight, 14 May 1894. Educated at King's College (London), he practised medicine in Somerset and Shropshire; taught at Manchester; was editorially connected with Dickens' periodicals, 'Household Words' and 'All the Year Round'; was for a time editor-in-chief of the *Examiner*; and in 1865 was appointed professor of literature in University College, London. In 1878 he received a similar chair at Queen's College, London; and in 1882-90 was principal of University Hall, London. As a popular lecturer on literature he was much in demand. He edited 'Morley's Universal Library' (1883-8); 'Cassell's National Library' (1886-90); and the 'Carisbrooke Library' (1889-91); published biographies of Palissy (1852), Jerome Cardan (1854) and 'Cornelius Agrippa' (1856); and wrote 'English Writers' (1887 et seq.), and a smaller work on the same subject, 'First Sketch of English Literature' (1873), a much-used manual.

Morley, John, English writer and statesman: b. Blackburn, Lancashire, 24 Dec. 1838. He studied at Cheltenham College and at Oxford in Lincoln College; was called to the bar in 1859; wrote for the 'Saturday Review'; edited the 'Literary Review' (later the 'Parthenon'); was editor of the 'Fortnightly Review' (1867-82); of the *Pall Mall Gazette* (1880-3), and of 'Macmillan's Magazine' (1883-5). He contested Blackburn unsuccessfully in 1869 and Westminster in 1880, but at a by-election in 1883 was chosen to the House of Commons largely because of his Irish policy (which favored a colonial type of government for Ireland), and was re-elected in 1886, in 1892 (in spite of the powerful opposition of a Labor candidate backed by Keir Hardie), in 1896 (having been defeated in 1895), and in 1901. He was chief-secretary for Ireland in Gladstone's brief

ministry of 1886, and in the Gladstone-Rosebery cabinet of 1892-5, his administration being sane and popular. Since 1894 Morley has been a trustee of the British Museum. He did much for the reunion of the Liberal party in 1887, being one of the famous Committee of Five. An able parliamentarian, he is better known as editor, biographer, essayist and former leader of the English positivists, and has written: 'Edmund Burke' (1867); 'Critical Miscellanies,' two series (1871-7); 'Voltaire' (1871); 'Rousseau' (1873); 'The Struggle for National Education' (1873); 'Diderot and the Encyclopædists' (1878); 'Burke' (1879); 'Richard Cobden' (1881); 'Studies in Literature' (1891); 'Oliver Cromwell' (1900); and the able and authoritative 'Life of W. E. Gladstone' (1903).

Morley, Margaret Warner, American educator and author: b. Montrose, Iowa, 17 Feb. 1858. She was graduated from the Normal College of New York in 1878 and has since taught in the Oswego Normal School, N. Y., and in the normal school at Milwaukee, Wis. She was for a time engaged in Armour Institute as teacher of biology and has lectured in Boston. She has published: 'A Song of Life' (1891); 'The Bee People' (1899); 'Wasps and Their Ways' (1901); 'The Insect Talk' (1903); and other works intended to familiarize young people with science.

Morley, Samuel, English philanthropist: b. Homerton, England, 15 Oct. 1809; d. near Tunbridge, Kent, England, 5 Sept. 1886. He engaged in mercantile business and amassed a large fortune, which he used in philanthropic enterprises. He represented Bristol in Parliament in 1868-85 and upon his retirement was offered a peerage which he declined. In Parliament he supported various religious and social reforms and was opposed to capital punishment. He was a generous contributor to different public benefactions and labored earnestly to improve the moral and social conditions of the poorer classes, in behalf of whom he spent large sums.

Morley, Thomas, English composer: b. 1557; d. London about 1604. He may have been trained as a choir boy in St. Paul's; was a pupil of Byrd; studied music at Oxford; from 1591 to 1592 was organist of St. Paul's; and in 1592 was appointed gentleman of the Chapel Royal. He is best known by his 'Book of Aires' (1600), which contains the page's song in Shakespeare's 'As You Like It' with the original music. Morley's 'Plaine and Easie Introduction to Practicall Musick' (1597), in dialogue form, is the earliest regular treatise on music published in England.

Mormon Crickets, western names for two species of migratory grasshoppers (*Anabrus simplex*, and *A. purpurascens*), which are especially destructive at times in Montana and Idaho. See GRASSHOPPER.

Mormons, or The Church of Latter-Day Saints, an American religious sect founded by Joseph Smith, Jr., at Fayette, Seneca County, N. Y., in 1830. In 1823, alleging that he was led by the inspiration of an angel who had appeared to him, he said that he discovered golden plates on which the records of Mormon were inscribed. These, though found in 1823, he was not allowed by the angel to take up till 1827. They were inscribed with

RIGHT HON. JOHN MORLEY.

MORMONS

characters which were said to be reformed Egyptian, but which he was unable to read. There was, however, in the box where they were found, so he declared, a marvelous instrument called Urim and Thummim, by which he was enabled to read the mysterious letters and translate them into English. In 1830 Smith published an English translation of the plates under the title 'The Book of Mormon,' together with certificates of 11 men who claimed to have seen the plates. This book tells how at the time of King Zedekiah of Jerusalem, a pious Israelite by the name of Lehi, together with his family, migrated from Palestine to America and described on these plates the account of his marvelous adventures as well as the revelations which God vouchsafed to him. Many of his sons, like Laman, went out into the wilderness and became the ancestors and chiefs of the North American Indians. The descendants of his son Nephi became good Christians, many centuries before Christ, and among them were preserved the dignity of the priesthood and their sacred plates. To the descendants of this family also appeared the Christ when He rose from the dead, and He chose from the family 12 apostles, who within a brief time converted the whole country to Christianity; but when at the beginning of the 4th century the Church, in consequence of wars, became disintegrated, Mormon, a mighty hero and pious Christian, rose and drove out the Lamanites who had in the meantime become red and fallen into barbarism. Nevertheless they returned about the year 400 and the Nephites perished before them. Mormon's son, Moroni, finished the history of his people in 420. The book was published in 1830, and it was at one time claimed that it was a plagiarism on a novel written by a clergyman named Solomon Spaulding several years before; but this manuscript has been discovered and compared with that of the Book of Mormon, and it is found that they are entirely different. Spaulding's manuscript is now in the Oberlin College, Ohio.

The new prophet immediately began to collect followers about him, and by 6 April 1830 he had organized a church at Fayette, N. Y. The next year the sect numbered several hundred members and moved to Kirtland, Ohio, where they increased in numbers and wealth through the efforts of missionaries who were sent out by the prophet. In 1831 they began to locate in Jackson County, Mo., but in 1833 they were driven out of the county, partly on account of their faith and partly on the charge of being abolitionists. They then took refuge in Clay County and the surrounding regions. In 1838 Governor Boggs of Missouri issued an exterminating order against the Latter-Day Saints and they were driven out of that State. They went to Illinois, where by 1840, on the site of a previous settlement called Commerce, Hancock County, they had founded the city of Nauvoo, over which Smith had extraordinary civil and military authority. The city flourished, soon numbering more than 2,100 houses and having a beautiful temple built according to plans which Smith claimed he had received in a vision. In 1844 a discontented member of the Church issued a newspaper at Nauvoo assailing the prophet and threatening to expose various alleged immoralities and mis-

deeds. The city council of Nauvoo passed an ordinance declaring the printing-office a nuisance. It was destroyed by the officers of the law. Smith was blamed for this and a warrant was issued for his arrest. Before civil war actually broke out, the governor of the State induced Smith to surrender and go to Carthage. On 27 June 1844, a mob attacked the jail, overpowered the guard, killed Smith and his brother Hyrum and wounded others of the prophet's party.

This did not put an end to Mormonism. Smith was succeeded by Brigham Young (see YOUNG, BRIGHAM), who early in 1846 left Nauvoo with others for the West. In the spring of 1847 a company of 143 started through the wilderness, and on 24 July arrived at the valley of Salt Lake, which he declared was the promised land. It looked far from being the promised land when they got there. Irrigation was absolutely necessary. The first crop they planted was small and the second nearly destroyed by crickets, but they pushed out into the valley, extending their agricultural operations, and made the wilderness blossom like the rose. They made Salt Lake their place of settlement and Young returned to Council Bluffs, where they had set up temporary headquarters, to bring the rest of the saints to Utah. Their new city became an important place on account of its position on the route of wagon trains to and from California, and owing to the wonderful discipline and management of the Mormons and to their system of irrigation, the wilderness, the soil of which was very fertile and needed only cultivation and water, began to prove most productive, and the city to flourish. Brigham Young, on account of his great influence, was appointed governor of the Territory, and Congress granted him \$20,000 for the erection of public buildings and \$5,000 for a library. In 1854 the government appointed Col. Steptoe as governor. But the Colonel declined the appointment, and Young was reappointed and continued to hold office until 1857, when A. Cumming was appointed in Young's place and was sent with 2,500 men to Utah. The expedition met with difficulties on account of the late season of the year and opposition on the part of the Mormons to having an army sent against them in time of peace, as they claimed that they had committed no hostile act against the United States government. A peace commission was sent to Utah in 1858, and the people who had already commenced to move away from their homes (which they had prepared to burn on the entrance of the army) were induced to return. Young, although deposed from his position as governor of territory by the appointment of Cumming, continued to possess great influence in the commonwealth. Many missionaries were sent out and the number of Mormons increased with great rapidity. Young died in 1877 and 1880 John Taylor was elected president. He had been with Joseph Smith in Nauvoo and was shot and wounded when Smith was killed. He died in 1887, and in the same year was succeeded by Wilford Woodruff, who was 80 years old; a most remarkable man, who preserved his faculties without impairment even beyond the age of 90. In 1890 he issued his famous manifesto forbidding polygamy. In 1896 Utah became a State and in the following year the 50th anni-

MORMYRUS—MORNINGSIDE COLLEGE

versary of the entering of the saints into that region, was celebrated. In 1898 President Woodruff died, and Apostle Lorenzo Snow succeeded to the presidency of the Church. He also was a very old man, more than 85 years old, a friend of Joseph Smith, and an apostle since 1849. President Snow died 10 Oct. 1901, and was succeeded by Joseph Fielding Smith, a nephew of Joseph the founder.

The membership of the Mormon Church is about 300,000 and there are flourishing communities in other countries besides the United States. Mormons express their belief in the Trinity, that men will be punished for their sins, that through the atonement of Christ mankind may be saved by faith, in repentance, in baptism, in the laying on of hands for the gift of the Holy Ghost. They believe in a church organization comprising apostles, prophets, pastors, teachers and evangelists, in the apostolic gifts of tongues, prophecy, visions, in the power of healing, in the Bible as the word of God, and in the book of Mormon as the further word of God. They believe in the literal gathering of Israel and the restoration of the 10 tribes, who will build Zion on the American continent, and that Christ will come himself to reign. Supreme authority is vested in the president, who is designated as "prophet, seer and revelator," and in two counsellors chosen by the body of the Church. There are 12 apostles and a hierarchy consisting of the patriarchs, seventies, high priests, elders, bishops, priests, teachers and deacons, the whole forming a pure theocracy. They believe in continuous divine revelation, but that the only authoritative communications from the Lord for the Church come through the prophet president. One of the characteristics of the Mormons has been a plurality of wives, which was regarded as a means of grace, the number of a man's wives and children increasing the man's chances of honor and glory in the world to come. They hold this doctrine to be wholly Biblical. It is maintained that the revelation sanctioning polygamy was received by the prophet as early as 1831, but was withheld from the body of the Church in general and from the world till after they had been settled in Utah. After 1852 polygamy was preached and practised openly, and the leading men generally were polygamists. In 1862 the Federal government enacted a law against the practice, but little attention was paid to it, and not till 20 years later were severer statutes passed against it. In 1884 the constitutionality of the law was established by the Supreme Court of the United States and more than 1,000 men were convicted and sent to the penitentiary, while many of the leading polygamists fled or went into hiding. In 1887 the Mormon Church was disincorporated by Congress, and its immense property was confiscated with the exception of \$50,000. Finally in September 1890, after the vast property holdings of the Church had been lost, President Woodruff issued his famous proclamation against polygamous marriages. In 1898 Brigham Henry Roberts was nominated for Congress by the Democratic party of the State, but owing to a charge made against him that he was still living in polygamous relations, his case was submitted to a special committee which recommended that he be not allowed to take his seat in Congress.

Salt Lake City, which is still the principal city of Mormons, is remarkable for its tabernacle, a building completed in 1867, 250 feet long, 150 feet wide, 80 feet high, without any supporting pillars, with a total seating capacity of 7,000. Its great organ and choral services, which are given there regularly by a choir of 600 voices, are among the most remarkable features of the Mormon service. Another wonderful building in Salt Lake City is the Temple, which was begun in 1853 and dedicated in 1893. See also **LATTER DAY SAINTS, THE REORGANIZED CHURCH OF.**

Revised by JOSEPH F. SMITH,
Of the Presidency of the Church of Latter-Day Saints.

Mormyrus, a fish of the Nile (*Mormyrus Petersi*), regarded as excellent for the table, and caught with line and hook. Its lower jaw is extended into a fleshy appendage, and its characteristic form is depicted on ancient Egyptian wall-paintings and carvings. It represents a group of malacopterous nocturnal North African river-fishes allied to the pikes.

Mornay, Philippe de, fê-lêp dè môr-nâ, SEIGNEUR DU PLESSIS-MARLY, French statesman: b. Buhy, Normandy, 5 Nov. 1549; d. La Forêt-sur-Sevre 11 Nov. 1623. He was brought up a Huguenot, entered Coligny's service; escaped to England at the time of the Massacre of St. Bartholomew; returned to France in 1573; and in 1576 joined the army of Henry of Navarre, who used not only his sword but his pen and his diplomatic gifts, made him a member of his council, and appointed him governor of Saumur. After Henry became Henry IV. of France and a Catholic, Mornay was the sole Huguenot leader and was even styled the "Huguenot pope" by his enemies. He retired to Saumur soon after the Edict of Nantes. Mornay wrote, among other controversial works aimed now at pagans or atheists, now at the Roman Catholic Church, '*De l'Eucharistie*,' urging the Calvinistic view of the Lord's Supper as opposed to transubstantiation (1598). His '*Mémoires pour servir à l'Histoire de la Réformation en France*,' re-edited in 1824, is a valuable source for the history of the period. His wife's memoirs (1824) detail his life down to 1606. Consult also Ambert, '*Duplessis-Mornay*' (1847).

Morning-glory, an annual twining or trailing vine (*Ipomœa purpurea*) or some related species, popular as a garden ornament all over the world, and often found escaped to the fields and roadsides. The vine is sometimes 10 feet tall, with large roundish heart-shaped leaves and large delicate ephemeral flowers of very various forms and colors. The seed may be sown in any garden soil well exposed to the sun, where the plants may be expected to grow the following year. They self-sow readily. If the soil is very rich they increase so fast as to make an excellent screen for a low porch by midsummer. See CONVOLVULACEÆ; IPOMÆA.

Morningside College, in Sioux City, Ia.; coeducational; founded in 1890 under the auspices of the Methodist Episcopal Church. In 1902 the school had 35 professors and instructors, and about 500 students. There were 4,000 volumes in the library; the grounds, building, and apparatus were valued at \$157,000;

the income was \$14,000, and the benefactions \$30,000. The collegiate courses lead to the degrees of A.B., B.S., and Ph.B.

Morny, Charles Auguste Louis Joseph, shārl ō-güst loo-ē zhō-zēf mōr-nē, Duc de, French politician; b. Paris 23 Oct. 1811; d. there 10 March 1865. He was said to have been a half-brother of Louis Napoleon, being a natural son of Queen Hortense and Count Flahault. He was for a time in the army, then tried commercial speculation, and finally politics. He took a prominent part on the side of Napoleon III. in the *coup d'état* of 1851, and was a conspicuous figure under the Second Empire, during which he was minister of the interior (1851-2), president of the Corps Législatif (1854-65), and ambassador to St. Petersburg (1856-7). Possessed of a certain sort of ability, he employed it with perfect unscrupulousness for the advancement of his personal interest.

Morocco, mō-rōk'ō, or **Marocco**, a sultanate or empire of northwest Africa, known to its inhabitants only by its Arabic name Moghrebel-Aksa, "The Extreme West." It is bounded on the west by the Atlantic Ocean, north by the Mediterranean Sea, northeast by Algeria, and east and south by the Sahara, the boundary in the southwest being formed by the Wady Draa, while elsewhere there is no definite line of demarcation between the French Sahara and Morocco; area, about 300,000 square miles. The rulers of Morocco exercised sovereignty at one time over Twat, or Touat, and several other oases in the heart of the desert; they even carried their victorious arms across the desert to Timbuktu. Now, however, they have little or no power south of Atlas, the great chain which traverses the country diagonally northeast to southwest throughout its whole extent. Morocco has three capitals or imperial residences, at one of which the Sultan and his army reside at uncertain intervals and for indeterminate periods. These are Fez (pop. 140,000), Makinas or Mequinez (56,000), and Marrakesh, better known as the City of Morocco (50,000). Besides these the principal coast towns are Tangier; Tetnan, a little way up the Martil River; Larache (El-Arish); Rabat and Sallee, on opposite sides of the Bu-Ragreb River; Casablanca, or Dar-al-Baida; Mazagan; Saffi; and Mogador. The empire is divided into districts named from the occupying tribes; another division is into provinces or districts, fluctuating and very unequal in number, sometimes confined to a single town, sometimes embracing an extensive territory, administered each by a *kaid*, whose chief duty it is to collect the imposts.

Topography.—Physically considered, Morocco falls naturally into four regions: 1. The great range of Atlas, from southwest to northeast, composed of two or more parallel chains. (See *ATLAS*.) 2. Er-Rif or the northern maritime district, comprising the chains of mountains which rise at no great distance from the Mediterranean Sea. 3. The wide belt of fertile plain, intermixed with gentle hill and valley, which lies between the two preceding regions. 4. The plains and valleys southeast of Atlas. The most remarkable natural feature is the great mountain system extending from northeast to southwest. This system—the Atlas—composed of several parallel chains, contains the most elevated points known in North Africa. Miltain, a peak distant

about 30 miles southeast from the city of Morocco, has a height of 11,400 feet, while another peak, Jebel Ayashin, is estimated at 14,600. Adjoining the central chain are several table-lands of great extent, consisting of irregular plains; and at a little distance from it north extends the maritime chain now called Er-Rif, and formerly the Atlas Minor. Its general height is from 2,500 feet to 3,500 feet.

Hydrography.—The rivers flowing from the north side of the Atlas have generally the shorter course, but are well supplied with water; those running south, however far they may extend, are dry in summer, at least in their lower courses. The Muluya, rising in a principal knot of the Atlas, flows in a northeasterly direction to the Mediterranean with a course of 350 miles, and receives many tributaries. Of the rivers which run into the desert, the most easterly, the Ghir, has a course southeast, occasionally traceable for 300 or 400 miles. The Ziz, which, with its numerous affluents, waters a very fertile and populous country, is wholly spent before it attains half that length. The Draa, which rises in the central and most elevated portion of the range of Atlas (lat. 31° to 32° N.), first runs south for nearly 200 miles, forms Lake Ed-Debaya, and then, turning west, enters the ocean in lat. 28° 18' N., after a course of 700 miles. The lower portion of its bed, however, is periodically quite dry. Lake Ed-Debaya, formed by the floods of the Draa, is reported to be very large; but it disappears annually, and gives way to richly cultivated fields. The fresh-water lake of Jebel el Akhdar (Green Mount) lies about 30 miles north of Morocco. The coast offers few good harbors; of these Tangier and Mogador, or Sweira, are the best; the rest are but open roadsteads at the mouths of rivers.

Natural Resources, etc.—The extent of the mineral wealth possessed by Morocco is not known with any accuracy. Copper, iron, and lead are obtained in larger or smaller quantities. The flora of Morocco includes the esculent oak and cork oak; in the higher regions of the Atlas the cedar and Aleppo pine, with many varieties of oxycedrus and juniper yielding fragrant gums; also the date-palm and the dwarf-palm east and south of the Atlas; and near the coast the *Elcodendron argan*, which yields an excellent oil. Among the wild animals are lions, panthers, ounces, wild boars, gazelles, and several species of large antelope, especially the bubalus. The locust makes its appearance in May, when it lays its eggs. The young brood come forth a month later in countless multitudes, and in another month they take wing, consuming all vegetation in their progress, and spreading desolation over the fields. They are gathered and eaten in large quantities. The ostrich is found on the south frontiers of Morocco.

Climate.—The climate west of Atlas is much more temperate than might be expected under such low latitudes. This is due to the circumstance that a lofty chain of mountains, covered in some parts with perpetual snow, intercepts the hot winds from the deserts of the interior, so that the equable and refreshing sea-breezes prevail throughout the year. Hence the extremes of temperature lie within moderate limits; the thermometer rarely falling below 40° F.

MOROCCO

in the winter, while it does not rise above 95° in summer. In the region east of the mountains intense cold is felt in winter; while in summer the heat of the plains is insufferable.

Agriculture.—The agriculture of Morocco is in the lowest possible condition, and the annual production is calculated barely to supply the wants of the country; though with proper cultivation and under an enlightened government Morocco might be one of the most productive countries in the world. Unfortunately, owing to oppression and extortion, there is nothing but discouragement for anyone attempting to reap advantage from these resources. The cereal crops are wheat, barley, and maize; but durrh or millet (*Sorghum vulgare*) constitutes the chief support of the population, though beans, the esculent arum, and even canary seed are much eaten by the poorer classes. The vine is cultivated only near towns for the sake of the fresh grapes and for the raisins. All the fruits of the south of Europe are cultivated to some extent. Large numbers of the inhabitants lead a pastoral life, subsisting wholly on the produce of their herds and flocks, or else on game and the wild fruits of the forest. The chief wealth of the tribes scattered over Morocco consists in their herds and flocks. The spirited small horses, for which the country was famous in ancient times, are still numerous, particularly in the southern provinces. Horned cattle are numerous, particularly in the north districts. The bulls are generally tractable, and are employed in the labors of the field—bullocks being little known. The sheep are supposed to number at least 45,000,000; while the goats are estimated at 10,000,000 or 12,000,000, and goat-skins constitute one of the principal articles of export.

Manufactures and Commerce.—In general, among the rural population, each family supplies all its own wants. In the towns, however, some manufactures are carried on. Fez makes and exports great quantities of the cloth caps which bear the name of that city. The tanners of Mequinez and other places have a great reputation, and Morocco carpets are much esteemed in Europe. The commerce is partly carried on with the adjacent countries, partly with European states. From the Sudan are obtained ivory, gold-dust, ostrich feathers, asafetida, gums, Guinea pepper, and slaves. Of the whole of the commerce with Christian states nearly half is carried on with Great Britain. The exports consist of beans, peas, almonds, goat-skins, eggs, wool, wax, etc.; the imports, of cottons and other goods. There are no made roads, railways, or canals. Morocco is connected with Spain by telegraph, and the telephone is in use in Tangier, Casablanca, and other coast towns. The posts are under the control of the Moorish, British, French, and German governments.

Money, Weights, and Measures.—Spanish dollars and pesetas, as well as Moorish coins minted for the Government in France are current, but of fluctuating value. The common currency consists of flocs (2½ cents) the blan-keel or muzoona of six flocs equaling approximately 16 cents; the okia or ounce of four blan-keels, about 64 cents, and the miktal of 10 ounces equaling 76 cents. The kintar of 100 rotals for native produce is equal to about 168

pounds; the kintar for imported articles about 112 pounds. The drak of eight tomms is equal to about 22 inches. The mudd dry measure by which grain is sold equals 1 17/60 bushel; the kula of 28 rotals, by which oil is sold wholesale, equals 47 pounds in weight, or 53 pints by measure.

Government.—The sovereign or Sultan of Morocco, styled by Europeans emperor, bears the title of Emir el Múmenin, or Lord of the True Believers. He is ordinarily called by his subjects simply *Seid-na*—our Lord. He is absolute in the strictest sense; the lives and properties of his subjects are at his disposal; from him alone proceed the laws, which he makes and unmakes at his pleasure. The imperial revenues are derived from arbitrary imposts on property, from duties on imports and exports, from monopolies, and from fines or confiscations. They amount to about \$2,500,000 per annum, which the Sultan receives and disposes of, uncontrolled. Every office is directly or indirectly purchased, small salaries or none are paid, the holders recouping themselves by plunder and oppression, tempered by the fact that at any moment they may be forced to disgorge to the Sultan, or in default be left to rot in the loathsome Moroccan dungeons, or be beaten or tortured to death. All justice is bought and sold. Yet, owing to the religious fanaticism of the people, and the mutual jealousies of the European powers, especially France, Great Britain, Italy and Spain, whose representatives reside at Tangier, these unsatisfactory conditions are preserved. The only European nation which at present has any territory in Morocco is Spain, which maintains a fortress at Ceuta, and four convict settlements, and a fishing station at Ifni. The military force maintained by the Sultan is said to amount to about 100,000 men, of whom a large portion are blacks and Bedawi from the southern desert. About 10,000 are drilled and equipped somewhat like European troops.

Population.—For an estimate of the population of Morocco there are no certain data. One of the most recent calculations estimates it at from 6,000,000 to 6,500,000. An important element of weakness in the social and political constitution is to be found in the several distinct races, which, so far from uniting, repel one another. The Berbers are the oldest inhabitants of the country, and they devote themselves to agriculture rather than to pastoral pursuits. The Arabs form the bulk of the rural population in the plains; some of them are cultivators, and some are Bedawi. In the towns along the coast are found the Moors, a people now physically distinct, whose origin as a distinct race cannot be satisfactorily explained. Their chief physical characteristic is their corpulence, and they are more indolent and much less social than the Arabs. A considerable number of Jews is to be found in all the commercial towns of Morocco, where, in spite of the oppressions to which they are subjected, they often accumulate wealth, being the sole dealers in bullion and holders of capital. To these various ingredients of a checkered population must be added the negroes and their posterity of every shade, who are particularly numerous in the southern provinces. The civilization of Morocco has sunk to a low condition. The educa-

MOROCCO

tion given at the schools in the chief towns, and completed at the University of Fez, does not go beyond the theology of the Koran. The public libraries, once famous, are now dispersed; true science is unknown, and whatever monuments of art are to be found in the kingdom point to the time when literature and art flourished under the Arabian dynasties in Spain. Music is the only art for which the Moors are said to manifest a decided taste, but they have not as yet arrived at any proficiency in it.

History.—In the Mauri of ancient writers it is easy to recognize the Moors of modern times. These people were supposed to have come from Asia, and particularly from Palestine, but their origin is doubtful. The Berbers are believed to be the representatives of the race that inhabited the country in the earliest historical times. After being for more than four centuries a part of the Roman empire, and in the latter period of its sway venerated with a corrupt Christianity, "Mauritania Tingitana" fell (429 A.D.) into the hands of the Vandals, who introduced the piratical habits which afterwards became so characteristic of the coasts of Barbary and Morocco. They held it till 533, when Belisarius having defeated them, it became subject once more to the Eastern empire. But in the latter part of the 7th century the Arabs spread over North Africa, and having taken possession of Mauritania, penetrated to the borders of the desert. About this time the Jews were expelled from Spain by decree of the Council of Toledo (694 A.D.), and sought refuge in great numbers on the shores of Africa. Near the close of the 8th century a Sherif or descendant of Mohammed named Edris obtained such an ascendancy over the Berber tribes that they made him their sovereign, with the title of Imâm. His son and successor founded in 807 the city of Fez. In 1035 the warlike sect of the Morabites rose into existence on the borders of the desert. In 1055 their chief was proclaimed sovereign of Moghreb-el-aksa. His grandson and successor reached the mountains, and in 1072 laid the foundations of the city of Morocco, which thus arose with the remarkable dynasty of the Morabites. The expulsion of the Moors and Jews from Spain (1480-1501 A.D.) added 800,000 souls, it is said, to the population of Moghreb-el-aksa. In the middle of the 16th century a new dynasty commenced with the descendants of the Sherif Hosein. The fifth of this family, commonly called Iamed Sherif el-Mansûr (1579-1603), made himself master of the whole of Moghreb-el-aksa, and pushed his conquests through the desert as far as Timbuktu and Kaghô. His reign is regarded as the golden age in the history of Morocco. The ninth and last Moroccan dynasty is that founded in 1648, by Mulai Sherif el-Mileli, or King of Tafilet. In 1814 the slavery of Christians was abolished, and piracy was prohibited in 1817. Several complications arose with France, caused by the plundering of French vessels by pirates, but in each instance the emperor gave compensation. In 1859-60 there was a war with Spain, owing to attacks made by some of the wild tribes upon the Spanish territory; it resulted in a cession of land and an indemnity of \$20,000,000 to Spain.

The present Sultan Abdul Aziz IV. succeeded his father El Hasan III., in 1894, when he was 14 years of age. For seven years the

government was in the hands of the grand vizier Si Ahmed Ben Misa who ruled despotically and kept the country well under control. At his death in May 1900, the Sultan virtually commenced his reign, and well-educated, of a liberal frame of mind, attempted to introduce reforms of a European character, which aroused the antagonism of his subjects, and a rebellion resulted under the leadership of Omar Zaraburi his elder brother. The royal troops were defeated, the Sultan and his capital invested, and the insurrection is (1903) still unchecked.

Consult Amicis, 'Morocco and its People' (1879); Bonsal, 'Morocco as it is' (1892); Hay, 'Morocco and the Moors' (1896); Meakin, 'The Land of the Moors' (1901).

Morocco, or Marrakesh, the second capital of the sultanate of Morocco (q.v.), on the north side of an extensive and fertile plain, 1,500 feet above sea-level, about 96 miles from Mogador, its port on the Atlantic, and 230 miles southwest of Fez, the chief capital of the empire. It has an excellent situation in sight of the Atlas mountains, from which cool streams are always flowing, and is noted for its genial and healthful climate. It commands the trade routes across the mountains, but the city has long been hastening to decay, chiefly the result of war, plague, and wretched government. It is encircled by a lime and earth wall nearly six miles in circuit, between 20 and 30 feet high, with square towers every 50 paces, and pierced by nine gates, but all in a ruinous condition. A large portion of the immense space within the walls is occupied by ill-kept gardens, open areas, and "soks," or market-places; the eight large cemeteries are outside the walls. In the bazaar and merchants' quarter a considerable local trade is carried on with the country people, the mountaineers from the neighboring Atlas, and with Sus, Tafilet, Mazagan, Saffi, and Mogador. Morocco possesses many mosques, one of which, the Kutubia, has a tower after the model of the Hassan in Rabat and the Giralda in Seville, 320 feet high. On the south of the city stands the palace, comprising a space of about 1,500 yards long by 600 yards wide, and near it is the Jews' quarter (El-Millah), a walled enclosure of about one and one half miles in circuit, one half of it nearly in ruins, thronged to suffocation, and excessively filthy.

There are several tanning and leather-dyeing establishments of considerable extent, though of late years European goods have been gradually displacing native manufactures. The population varies according to the presence or absence of the Sultan, his court, and army. Morocco was founded in 1072 by the Emir Yusef ben Tachefyn, and reached the summit of its prosperity in the 13th century. In those days it is affirmed to have contained more than 700,000 inhabitants. During several centuries it suffered from civil wars, and was sacked by the rebellious Berbers more than once. Pop. estimated at from 50,000 to 60,000.

Morocco, or Maroquin, a fine kind of leather, prepared from the skin of the goat, originally brought from the Levant and the Barbary States, but now manufactured in most other countries. The colors most commonly communicated to it are red (by cochineal) and yel-

low (by the Avignon or yellow berries). See also LEATHER.

Morong, Thomas, American botanist: b. Cahaba, Ala., 1827; d. 1894. He went in boyhood to Massachusetts, and was graduated at Amherst College in 1848. After studying law he pursued a course in theology at Andover, leaving the seminary in 1853. He had early developed an interest in botany, and in 1888 began a voyage which led to valuable explorations and botanical collections made in Argentina, Chile, and Paraguay. Returning in 1890, he became curator of the Columbia College herbarium. With N. L. Britton (q.v.) he published 'An Enumeration of the Plants Collected by Dr. Thomas Morong in Paraguay, 1888-90.'

Mórong, mō'rōng, Philippines, a pueblo of the province of Rizal, Luzon, situated on the Bay Lagoon (Laguna de Bay), 19 miles southeast of Manila. It was formerly the capital of the province of Mórong. Pop. 9,430.

Moroni, Giovanni Battista, jō-vān'nē bāt-tēs'tā mō-rō'nē, Italian painter: b. Bonda, near Albino, 1525; d. Bergamo 5 Feb. 1578. He painted many altarpieces and historical compositions, some of which are to be found in the Brera Library at Milan, others in villages of the province of Bergamo. He was, however, most especially celebrated for his portraits which are lifelike and arrest the attention by their startling projection and lucid color tone. Many of them are to be met with in Italy. There are three examples in the Berlin Museum and five in the London National Gallery, amongst which is 'The Tailor,' a masterpiece. One picture of this master is in the Pinakothek at Munich.

Moros, mō'rōz, people of the Malay race inhabiting the southwestern part of the Philippines, chiefly the Sulu Archipelago and the islands of Palawan and Mindanao; various subdivisions include the Ilanos, Samales, Joloanos, Maguendanaos, etc. Mohammedanism was propagated among the Moros in the 14th century by Malays from the island of Borneo, and is the prevailing religion. The Moro alphabet, which is still retained in writing, shows distinct traces of Arabic origin introduced by Arabic teachers of the doctrines of Islam. The Moros are governed by their local chiefs, dattos or sultans, under a form of primitive feudalism.

They have no system of laws as such. The penal passages of the Koran, taken in connection with local customs, are referred to as the *Titab*; the local customs being mainly interpretations or even evasions of the Koran. Land is held in common, the dattos claiming sections as their own; in some localities, a "Master of the Field" allots plots of ground to individuals for permanent or temporary occupancy. Such real estate may not be alienated without permission having first been obtained from the authority granting residence thereon. Slavery and polygamy prevail among them; and they have for many years engaged in piracy and predatory expeditions against the neighboring Filipinos. Their religion and peculiar customs, as well as their spirit of independence have made the government of their country one of the greatest problems of the United States occupation of the Philippines. The Sulu Archipelago in 1901 was placed under military supervision and government in accordance with a treaty made by the United States repre-

sentative and the Sultan of Sulu, whose power, however, is diminishing among his people (see SULU). In 1903 a law was passed by the Philippine Commission providing government for the Moro country of Mindanao and adjacent islands; this act provides that the civil governor of the Philippine Islands shall appoint for the Moro Province a governor, attorney, secretary, treasurer, superintendent of schools and an engineer; these officials also constitute a legislative council of which the governor is presiding officer. The provincial governor and engineer may be officers of the army detailed on request of the Philippine Commission by the commanding general of the division of the Philippines to perform the civil duties of such office.

It is further provided that the legislative council shall enact laws for the organization of a school system; for the creation of local governments among the Moros and other non-Christian tribes, also laws investing district governors with the power of adjusting under the supervision of the provincial governor, all differences between sultans, dattos and any independent local authorities; shall collect and codify the laws of the Moros and make them consistent with the laws of Congress; provide courts; and enact laws providing for the abolition of slavery and the suppression of all slave hunting and slave trade. The lessening of the evils of slavery has received particular attention from the American authorities from the first. The Moros were informed in 1900 that slaves who sought the protection of the United States garrison would be considered free and their freedom enforced. The datto at Zamboanga in 1901 abolished slavery among his followers. In 1903 the legislative council of the Moro province passed a law prohibiting slave hunting in all the province, which law was immediately confirmed by the Philippine Commission.

Morosau'rus, a genus of sauripodous dinosaurs (q.v.), with an extremely long and flexible neck, and small body; found fossil in the Upper Jura beds of Wyoming and Colorado. It was related to *Brontosaurus* (q.v.).

Morosini, Andrea, ān-drā'fā mō-rō-sē'nē, Venetian historian: b. Venice 13 Feb. 1558; d. there 29 June 1618. He was educated in belles-lettres at Padua, and from 1583 was in the service of the state. In 1600 he entered the senate, later was three times elected to the Council of Ten, and in 1598 was made official historiographer of the republic to continue the work of Paolo Paruta. He was given access to the state papers as far as 1594. His history, 'Historia Veneta ab Anno 1521 ad Annum 1615,' appeared in 1623 (2d ed. 1719), and has been esteemed for its accuracy and elegant Latinity.

Morosini, Francesco (called the PELOPONNESIAC), Venetian soldier: b. Venice 1618; d. Napoli di Romagna 6 Jan. 1694. He was a leading military commander of his day, and four times made generalissimo of Venetian forces. His career was almost a continuous struggle with the Turks. In 1656 he became governor of Candia, but in 1669 was compelled to surrender the island to Mehmet Koprilî. His sobriquet was gained by later victories in the Morea. From 1688 he was doge of Venice. Daru ('Histoire de la République de Venise' 1819; 4th ed. 1853) calls him "the last of the Venetians."

Morpheus, mör'fūs, in classical mythology, a minister of the god Somnus, sometimes called the god of sleep. He is generally represented as a slumbering child, of great corpulence, wearing wings, and holding a vase in one hand, and in the other some poppies.

Morphine, an alkaloid occurring in opium, and having the chemical formula $C_{17}H_{19}NO_3 + H_2O$. In preparing it, the opium is extracted with water at $100^\circ F.$, calcium carbonate is added, and the solution is evaporated to a small bulk. Calcium chloride is then added, to precipitate the meconic acid that the extract contains, and after filtration the solution is evaporated. Calcium meconate separates out first, after which crystals of the hydrochlorides of morphine and codeine are deposited. The latter crystals are re-dissolved in water and treated with ammonia, the morphine being thereby precipitated while the codeine remains in solution. Morphine dissolves in 1,000 parts of cold water, and in 500 parts of boiling water. It is also readily soluble in hot alcohol, but is insoluble in ether. It is bitter and very poisonous, and crystallizes in small trimetric prisms. Morphine acts as a base toward acids, and numerous salts of the alkaloid are known. In medicine, morphine is usually administered in the form of the sulphate or some other salt. When morphine is heated with hydrochloric acid for two or three hours at a temperature of about $290^\circ F.$ (sufficient pressure being exerted upon the solution to make this possible), it becomes converted into another alkaloid which has the formula $C_{17}H_{17}NO_3$, and is known as "apomorphine." Apomorphine is also poisonous, and its salts, when administered in small doses, cause vomiting. Special attention has been paid, by chemists, to the positive identification of morphine, owing to the frequent importance of such identification in medical jurisprudence. The subject is full of technical difficulties, especially when (as is commonly the case) morphine, if present, is mingled with large quantities of animal tissue, from which it must be separated before the tests are applied. Many such tests are known, of which the following are the most familiar: (1) A neutral solution of a ferric salt, when added to a neutral solution of a morphine salt, gives a blue color which is destroyed by heat, by alcohol, and by acids. (2) If iodic acid and starch are added to a weak solution of a morphine salt, and a weak solution of ammonia is floated upon the mixture, a brown ring below a blue ring will be formed at the bounding surface that separates the liquids from each other.

Morphology, the division of biological science which deals with the structure and form of animals and plants, from Gr. *morphē*, form, and *logos*, doctrine, the term being equivalent to "science of form." The investigation of the structure of living organisms is the only true method by which we may become acquainted with their relations to each other, singly or in groups. Morphology thus lies at the foundation of physiology, and all true systems of classification and explanations of serial development. Goethe was the inventor of the term, and was the first to direct attention to relations in structure presented by living beings, although the terms as employed by Goethe had reference rather to the unvarying phenomena of animal

and vegetable life than to the more specific sense in which modern biologists use the name. The modern morphologist must consider not only comparative anatomy but embryology, and include in his science an investigation of the past history and development changes of each subject—its phylogeny as well as ontogeny. The science, in truth, is now a study of the facts of phylogeny. The results of this science form the substance of text-book knowledge, and the terms, which are the names of the parts of animals, are defined in all good dictionaries. For a general outline of the morphology or structure of animals or plants see respectively ANATOMY, COMPARATIVE, or ANATOMY OF PLANTS.

Morphy, mör'fi, Paul Charles, American chess-player: b. New Orleans, La., 22 June 1837; d. there 10 July 1884. He showed his fondness for chess at a very early age, and at 12 had defeated many of the local amateurs. At the College of South Carolina he studied law for several years, occasionally playing a game. In 1857, at the first American chess congress held in New York he had no difficulty in defeating his strongest opponents. During the next year, in England, he successfully met such players as Bird, Boden, and Löwenthal, and astonished the world of chess by playing as many as eight games simultaneously and without the board. His playing in Paris, where he won five games out of eight against Harrwitz, and exhibited his blindfold skill, was equally surprising. In 1859 he returned to the United States and here met the famous German player Anderssen, winning 7 out of 11 games. Being now admitted to the bar, Morphy began to practise law in his native city: but his mental powers had been so impaired by the strain of his blindfold chess-playing that he not only gave that up, but relinquished chess entirely, and a little later abandoned all intellectual work. Morphy's skill at chess appeared to partake of the quality of genius. His brilliant achievements were not the result of long or deep deliberation, yet displayed all the elements usually observed when mental strength and quickness are sustained by profound study. Consult Löwenthal, 'Morphy's Games of Chess' (1860).

Morrell, Imogene Robinson, American artist: b. Attleboro, Mass. She was married to Abram Morrell in 1869. After studying art in the United States she proceeded to Europe, and became a pupil of Adolf Schroder at Düsseldorf, and of Couture at Paris (1864). In 1874 she returned to America where she opened a studio at Washington as a portrait and historical painter, and there established and became first president of the Washington National Academy of Fine Arts 1879. Twelve medals have been awarded to her paintings, among which some of the most notable are: 'The First Battle of the Puritans'; 'Washington Welcoming the Puritan Trains at Newburgh, N. Y.'; 'Portrait of General John A. Dix.'

Morrill, mör'il, Anson Peaslee, American politician: b. Belgrade, Maine, 10 June 1803; d. Augusta, Maine, 4 July 1887. He at first engaged in business in his native town, then in 1833 was sent to the State legislature, and in 1839 received the appointment of sheriff of Somerset County. This position he held till 1840. In 1850 he was appointed land agent. In

MORRILL—MORRIS

1853 he was an unsuccessful candidate for governor on the Prohibition and Free-Soil tickets, but the following year he was elected as the first Republican governor of Maine, and later was a delegate to the convention which nominated Frémont. In 1860 he was elected to Congress, but declined a re-election.

Morrill, Justin Smith, American senator: b. Strafford, Vt., 14 April 1810; d. Washington, D. C., 28 Dec. 1898. He received a good primary and secondary education, was a merchant and then a farmer; was elected to the House of Representatives in 1854, and was re-elected five times; in 1867 was transferred to the Senate, in which he was long chairman of the committee of finance. With his 12 years in the lower house and 31 in the upper he was more closely connected with Congress than any other man of his time, and was styled "The Father of the Senate." He introduced the war revenue tariff of 1861, commonly called the Morrill tariff, and during his later years consistently opposed the remonetization of silver. Senator Morrill wrote 'The Self-Consciousness of Noted Persons' (1886).

Morrill, Lot Myrick, American politician: b. Belgrade, Maine, 3 May 1813; d. Augusta, Maine, 10 Jan. 1883. He was educated at Waterville College (now Colby University), studied law and was admitted to the bar in 1839 when he went to Augusta and established a law practice. He took an active part in politics, in 1854 was elected to the legislature and in 1856 was chosen president of the senate. He was governor of his State 1858-60 and in the latter year was elected to the United States Senate where he proved himself an indefatigable worker. He favored the resumption of specie payment and was an authority on financial, naval, and Indian affairs. In 1876 he retired from the Senate to become secretary of the treasury under President Grant and during his administration of that office constantly urged the return to specie payment. He declined an appointment to a foreign mission under President Hayes and in 1887 became collector of customs at Portland, Maine, in which office he died.

Morris, Benjamin Wistar, American Protestant Episcopal bishop: b. Wellsborough, Pa., 30 May 1819. He was graduated from the General Theological Seminary in 1846, took priest's orders in the Episcopal Church in 1847 and held successive rectorates in Sunbury, Manayunk, and Germantown, Pa. He was consecrated missionary bishop of Oregon and Washington in December, 1868, and on the division of the diocese in 1880, became bishop of Oregon. He has published 'Presbyterian, Baptist and Methodist Testimony to Confirmation.'

Morris, Charles, English song writer: b. 1745; d. near Dorking, Surrey 11 July 1838. In 1764 he entered the 17th foot, with which he served in America, later exchanged into the Irish Dragoons and the 2d life-guards, in 1785 was made bard of the Beefsteak Society, and before its gatherings sang many of his wittiest efforts. His humor and vivacity led Curran to say, "Die when you will, Charles, you will die in your youth." He wrote hundreds of songs, many being political ditties for the Whigs; and a posthumous volume, 'Lyra Urbanica' (1840) collected them. His 'A Reason Fair to Fill my

Glass' was praised by Moore and set to music by Charles Dibdin.

Morris, Charles, American naval officer: b. Woodstock, Conn., 1784; d. 1856. Entering the navy in 1799, he participated in the war with Tripoli, was an actor in the recapture of the Philadelphia, in the harbor of Tripoli (1804), being the first to gain her deck when she was boarded. At the outbreak of the War of 1812 he was serving as executive officer of the Constitution; he was wounded in the engagement of "Old Ironsides" with the Guerrière; and afterward successfully commanded the John Adams until, being blockaded by a British squadron in Penobscot River, he was compelled to destroy his ship to save her from being taken by the enemy. In the war with Algiers he commanded the Congress, and it was he who, in the Brandywine, carried Lafayette home to France. After serving for some years as naval commissioner, and as supervisor of the United States Naval Academy, he became chief of the bureau of ordnance and hydrography, which position he held till the time of his death. Consult his 'Autobiography' (1880).

Morris, Charles, American author: b. Chester, Pa., 1 Oct. 1833. He was educated in Chester, and became professor in the Academy of Ancient and Modern Languages, Philadelphia; afterward engaged in business; and since 1878 has devoted himself to literary work, giving special attention to historical and scientific subjects. His publications include: 'A Manual of Classical Literature'; 'The Aryan Race'; 'Tales from the Dramatists'; 'The War with Spain'; 'Our Nation's Navy'; 'Famous Men and Great Events of the 19th Century,' etc. He has also edited 'Half Hours with the Best American Authors,' 'The Encyclopedia Dictionary,' and other works.

Morris, Clara, American actress: b. Toronto, Canada, 1849. In 1869 she became the leading lady in Wood's Theatre, Cincinnati, Ohio, and in the winter of 1869-70 joined Augustin Daly's Fifth Avenue Company, New York. She at once achieved success in emotional roles, and afterward made many tours throughout the United States. Her leading roles include 'Camille'; 'Alix' in the 'Countess de Sommerive'; 'Mercy Merrick'; 'Miss Multon'; 'Lady Macbeth'; 'Leah the Forsaken'; and 'Cora' in 'L'Article 47.' She wrote much for periodicals, and published in book-form: 'A Silent Singer' (1899); 'My Little Jim Crow' (1900); 'A Pastebord Crown,' a work of fiction (1902); and 'Stage Confidences' (1902). She was married to F. C. Harriott in 1874.

Morris, Daniel, British colonial expert: b. Loughor, Glamorgan, 26 May 1844. He was educated at Cheltenham, at the South Kensington Royal College of Science, and at Trinity College, Dublin, where he received high honors. He was assistant director of the Royal Botanic Gardens of Ceylon in 1877; investigated and checked the coffee-leaf disease; became director of the Botanic Department of Jamaica in 1879, assistant director of the Royal Gardens at Kew in 1886, treasurer of the Royal Horticultural Society in 1896, and Commissioner in the West Indian Imperial Department in 1898. Among his publications are: 'Cacao: How to Grow and How to Cure it' (1882); 'Agricultural Re-

MORRIS

sources of St. Helena' (1884); 'The Vegetable Resources of the West Indies' (1888); 'Sisal Industry of the Bahamas' (1896); and 'Cantor Lectures on Plants yielding Indiarubber' (1898).

Morris, Edward Joy, American author; b. Philadelphia, Pa., 16 July 1815; d. there 31 Dec. 1881. He was graduated from Harvard in 1836 and was admitted to the bar in 1842. He was a member of the Pennsylvania legislature in 1841-3 and of Congress in 1843-5 and in 1850 was appointed to a mission in Naples where he remained four years. He was again in Congress in 1858-61 and was then appointed minister to Turkey by President Lincoln and continued in office until 1870. He published: 'Notes of a Tour through Turkey' (1842) and numerous translations.

Morris, Edward Parmelee, American Latinist, best known as a Plautine scholar; b. Auburn, N. Y., 1853. He was graduated at Yale in 1874, studied at Leipsic and Jena, was professor of Latin at Williams 1885-91, and since the latter date at Yale, and edited the following plays of Plautus: 'Mostellaria,' 'Pseudolus' (1890), and 'Captives and Trinummus' (1898).

Morris, George Perry, American journalist; b. Montclair, N. J., 18 Feb. 1864. He was educated at Rutgers College and Johns Hopkins University, and in 1891 was associate editor of the Boston 'Congregationalist.' In 1898-1900 he was editor of the New York *Mail and Express*. He has published: 'The Norwegian Company System' (1894); 'Historic Towns of New England' (1898); etc.

Morris, George Pope, American journalist and poet; b. Philadelphia 10 Oct. 1802; d. New York 6 July 1864. With Samuel Woodworth (q.v.), in 1823, he founded the New York 'Mirror,' a weekly journal of literature, afterward published as the 'New Mirror' and the 'Evening Mirror,' in which many of the early writings of Bryant, Poe, Halleck, Willis, and other American authors first appeared. In 1845 Morris established the 'National Press,' which in the following year became the 'Home Journal,' and which, with the assistance of N. P. Willis (q.v.), he continued to edit almost to the end of his life. He wrote 'Briarcliff,' a popular drama (1825), and edited 'American Melodics' and (with Willis) 'The Prose and Poetry of America' (1845). His 'Poems' (final collection, 1860) included 'Woodman, Spare that Tree'; 'A Long Time Ago'; 'My Mother's Bible'; and other well-known pieces.

Morris, George Upham, American naval officer; b. Massachusetts 3 June 1830; d. Jordan Alum Springs, Va., 15 Aug. 1875. He was appointed midshipman in the navy in 1846 and received steady promotion. In 1862 he was made lieutenant-commander and assigned to the Cumberland and was in temporary command of her when she was attacked by the Merrimac in Hampton Roads. The gallant seamanship displayed by Morris on this occasion elicited the admiration of the country. He refused to leave the ship and stood at his post as she went down but was rescued by some of his men. He afterward had command of the gunboat Port Royal and was engaged on the James River, at Fort Darling, and later at Fort Powell and at Grant's Pass. He was promoted commander in 1866 and retired from active service in 1874.

Morris, Gouverneur, American statesman; b. Morrisania, N. Y., 31 Jan. 1752; d. there 6 Nov. 1816. He was graduated in 1768 from King's College (now Columbia University); after study of the law was licensed in 1771 to practice as an attorney; did excellently well at the bar; and during the earlier difficulties between Great Britain and the American colonies maintained a conservative attitude and was eager to effect a compromise. He finally, however, identified himself with the patriot cause, and was elected from Westchester County to the provincial congress of New York, 70 of whose 81 delegates met on 22 May 1775 at New York. In this assembly he became the leader of the patriotic party, and made an able speech favoring the adoption of the recommendation of the Continental Congress that the colonies establish new governments. A delegate to the constitutional convention of New York, he was chosen to the committees for drafting a plan for the constitution—in which Livingston and Jay were also prominent—and for establishing a State fund. In 1777-80 he was a member of the Continental Congress, and almost immediately upon taking his seat was appointed one of a committee of five to visit Valley Forge and examine the condition of the troops. Early in 1779 he was made chairman of the important committee for receiving communications from our ministers abroad, and from the envoy of France. In this capacity he drew up the draft of instructions to the ministers which was adopted by Congress and formed the basis of the treaty of peace with Great Britain. In February, 1780 he began the publication in the 'Pennsylvania Packet' of a series of essays on American finances, in which he endeavored to show the wisdom of the colonists submitting to a reasonable taxation and outlined a scheme for such assessment. These essays influenced his appointment in 1781 as assistant financier, a post he successfully filled until 1785. He was really the founder of the national coinage, though his plan was later modified by Jefferson and Hamilton; he introduced the decimal notation and devised the word "cent" to indicate one of the lesser coins. In 1787 he was a delegate to the constitutional convention, and there he advocated a strongly centralized government, and finally revised the draft of the instrument. He was in France in 1788-91 for the transaction of private business, and in 1791 was appointed by Washington a confidential agent to treat with Great Britain regarding certain unfulfilled articles of the treaty of peace. In 1792-4 he was minister to France, and in 1800-3 was United States Senator, filling a vacancy. He supported the Louisiana Purchase, but opposed the abolition of direct taxes and of the judiciary system. In 1810-13 he was chairman of the Erie canal commission; in the entire plan for this waterway, which he wished to make large enough for ships, he was a leader. He was keen in intellect, an excellent orator, and rendered notable services to America. During the War of 1812 his ultra-Federalist views led him into positions that were extravagant and unwise. He pronounced funeral orations on Washington, Hamilton, and Clinton; published pamphlets and addresses; and latterly contributed to newspapers political satires in both prose and verse. Consult: Sparks, 'Life' (1832); Roosevelt, 'Life' (1888); 'American

MORRIS

Statesmen' series); Morris (A. C.), 'Diary and Letters of Gouverneur Morris' (1888).

Morris, Gouverneur, American novelist, great-grandson of the preceding: b. New York 7 Feb. 1876. He was graduated from Yale in 1898 and has published 'A Bunch of Grapes' (1897); 'Tom Beauling' (1901); 'Aladdin O'Brien' (1902).

Morris, Harrison Smith, American author: b. Philadelphia 4 Oct. 1856. He was educated in the public schools, and early began to do literary work. Since January 1899 he has been editor of 'Lippincott's Magazine.' He is versed in the history of art, and is managing director of the Pennsylvania Academy of Fine Arts, in Philadelphia. He has written: 'A Duet in Lyrics,' poems, with J. A. Henry (1883); 'Tales from Ten Poets' (1893); 'Madonna and Other Poems' (1894); a continuation of Lamb's 'Tales from Shakespeare' (1893); and has edited 'In the Yule Log Glow' (1892) and 'Where Meadows Meet the Sea' (1892).

Morris, Henry W., American naval officer: b. New York 1806; d. there 14 Aug. 1803. He entered the navy in 1819 and in 1828 was made lieutenant. He was on duty in New York and various other stations from 1839 until 1855 when he was fleet-captain in the Mediterranean under Commodore Stringham. In 1861 he superintended the completion of the Pensacola and in 1862 took command of her, successfully passed the Confederate fortifications on the Potomac and took a distinguished part in the battles at Fort Jackson, Fort St. Philip and Chalmette. He guarded New Orleans after its capture but failing health necessitated his return to the North where he soon after died. He was promoted commodore in 1862.

Morris, John Gottlieb, American Lutheran clergyman: b. New York 14 Nov. 1803; d. Lutherville, Md., 10 Oct. 1895. He was graduated from Dickinson College in 1823 and studied theology at the Princeton and Gettysburg Seminaries, receiving his license to preach in 1826. He founded the 1st English Lutheran Church of Baltimore and was in charge of it in 1827-60 after which he held various important charges. He was chiefly instrumental in the founding of the College for Women in Lutherville and of the town. From 1834 until his death he was lecturer at Pennsylvania College and he also lectured in the Smithsonian Institution at Washington. He was prominently connected with scientific and religious societies and founded the 'Lutheran Observer' in 1831 which he edited until 1833. Among his many publications are: 'Catechumen's and Communicant's Companion' (1831); 'Life of John Arndt' (1853); 'Fifty Years in the Lutheran Ministry' (1878); 'Memoirs of the Stork Family' (1886); etc.

Morris, Lewis, American statesman: b. New York 1671; d. Kingsbury, N. J., 21 May 1746. He practised law in New York, was judge of the superior court of New York and New Jersey in 1692, became one of the governor's council and a member of the assembly, and drew up and presented to Queen Anne the complaint against Governor Cornbury formulated by the assembly. In 1710-38 he was chief-justice of New York and New Jersey, in 1731 was acting governor of New Jersey, in 1738 was prominent

in effecting the separation of New Jersey from New York, and from 1738 until his death was governor of New Jersey.

Morris, Lewis, American patriot, one of the signers of the Declaration of Independence: b. Morrisania, Westchester County, N. Y., 1726; d. there 22 Jan. 1798. After being graduated at Yale College in 1746, he engaged in farming on a very extensive scale on his paternal estate at Morrisania. He took strong ground against the act of Parliament compelling the inhabitants of the province of New York to furnish with supplies the foreign troops quartered upon them. He was elected to the Congress of 1775, was a member of the committee to devise means for supplying the colonies with munitions of war, and after the close of the session was sent west to detach the Indians from the British. In 1776 he resumed his seat in Congress, and signed the Declaration of Independence, although his estate was at that time in the hands of the enemy. As a consequence his manor was laid waste, and his family expelled. In 1777 he was succeeded in Congress by Gouverneur Morris, his half brother, but afterward served in the State legislature. The latter part of his life was spent at Morrisania. He was one of the boldest and most zealous promoters of the Revolution.

Morris, Sir Lewis, Welsh poet: b. Carmarthen, Wales, 1834. He was educated at Oxford, studied law and was admitted to the bar of Lincoln's Inn in 1861, practising his profession until 1881. He has been deputy chancellor of the University of Wales and prominently associated with the cause of education in Wales. In 1895 he was knighted. His verse is fluent, but deficient in strength, and has been very popular, his 'Epic of Hades' (1876-7) going through many editions. Other volumes of his verse are: 'Songs of Two Worlds' (1872-5); 'Gwen: a Drama in Monologue' (1879); 'The Ode of Life' (1880); 'Songs Unsung' (1883); 'A Vision of Saints' (1890); 'Harvest Tide' (1901); etc.

Morris, Mary Philipse, American Tory: b. Philipse Manor, New York, 1730; d. York, England. She was one of the famous Philipse family, daughter of the second lord of the Manor, Frederick Philipse. A beautiful brunette, she is the original of Cooper's heroine in 'The Spy,' and was long said to be one of George Washington's loves; but the story that she rejected him is untrue. Two years after meeting Washington she married George Morris (1758), with whom she lived in what was afterward Washington's headquarters and the Jumel house. Her property was confiscated at the opening of the Revolution, and she went to England. Her surviving children, being free from attaint according to the ruling of the English attorney-general, sold their rights to John Jacob Astor for £20,000; and the British government paid them £17,000 more for their losses.

Morris, Robert, American financier and statesman, a signer of the Declaration of Independence: b. Liverpool, England, 31 Jan. 1734; d. Philadelphia 8 May 1806. He came to the colonies about 1747 and entered at Philadelphia the counting-room of Charles Willing, merchant; in 1754 formed a partnership with Thomas Willing maintained until 1793; acquired a very considerable fortune for America of that

MORRIS

time; and despite a strong English loyalty opposed the stamp act and signed the non-importation agreement of 1765. In October 1775 he was elected to the provincial assembly, and in 1776-8 was a member of the Continental Congress. On 2 July 1776 he voted against the Declaration of Independence, and on 4 July absented himself; but on 2 August, he was one of the signers. When hostilities began his services became of increasing value. When Congress fled from Philadelphia to Baltimore on 12 Dec. 1776, Morris was left in charge of its affairs, and when it reassembled at Baltimore on 20 December was made with George Clymer of Pennsylvania and George Walton of Georgia a committee for the execution of Continental business. Morris did all that was done. Most of the business of the colonies during December and January was transacted by him; he prepared American ships for sea, assumed charge of incoming freights, and supplied Washington with money. On 20 Feb. 1781 he was elected superintendent of finance. He found the treasury in a disordered state; presented to Congress a plan for the organization of the Bank of North America, accepted 28 May; and himself subscribed for \$39,200 worth of shares. The bank was incorporated 31 Dec. 1781 and began operation 7 Jan. 1782. Morris resigned January 1783, but on request did not retire until 1 Nov. 1784. He was a member of the Pennsylvania assembly in 1776-8, 1778-9, 1780-1, 1785-7. In 1787 he was a member of the convention that framed the United States Constitution. He declined the secretaryship of the treasury, and was United States Senator from Pennsylvania in 1789-95. With James Greenleaf and against Washington's advice, he entered land speculation, purchasing in the new city of Washington 6,000 lots at \$80 each, and agreeing to build yearly 20 brick houses. He was compelled to make an assignment, and was imprisoned for debt at Philadelphia from 19 Feb. 1798 to 26 Aug. 1801. The influence of his credit, his ability in raising loans, and his financial skill were of the utmost importance to the struggling cause of the Revolution; and it is generally admitted that he was also a momentous force in Washington's administration. Consult: Sparks, 'Diplomatical Correspondence of the Revolution' (1829-30); the 'Life' by Sumner (1892) in the 'Makers of America' series; and Oberholtzer, 'Robert Morris: Patriot and Financier' (1903).

Morris, Thomas, American statesman: b. Augusta County, Va., 3 Jan. 1776; d. Bethel, Ohio, 7 Dec. 1844. He removed in 1795 to Columbia, Ohio, and was employed by the Rev. John Smith, the first senator from Ohio. He fixed his residence in 1800 in Clermont County, studied law, was admitted to the bar, was a member of the State legislature from 1806 to 1830, was a judge of the State supreme court (1815-21), and in 1832 was elected to the United States Senate, where he distinguished himself as an opponent of slavery, and was engaged in important debates with Calhoun and Clay in defense of the right of petition and of the duty of the general government to discourage slavery. His anti-slavery sentiments rendered him distasteful to the Democratic party, by which he had been elected, and he permanently retired in March 1839. In 1844 he was nominated for vice-president by the Buffalo convention of the

Liberty party, on the ticket with J. G. Birney (q.v.) for president.

Morris, William, English poet and artist: b. Walthamstow, Essex, 24 March 1834; d. Hammersmith, London, 3 Oct. 1896. He was educated at Marlborough College and Oxford University, and was for some nine months a pupil in the office of the noted architect, George Edmund Street. In 1856 he founded 'The Oxford and Cambridge Magazine,' to which he contributed often, and which he published at his own expense for the year it was issued. Two years later (1858) appeared 'The Defense of Guinevere and Other Poems,' in the pages of which the temper of the Middle Ages may be said to find its most accurate modern interpretation. In 1867 he published the 'Life and Death of Jason,' an epic of 17 cantos in heroic couplets, which showed him to be a teller of stories *par excellence*. By this time he had definitely entered upon his career of weaver anew of old tales from classic or mediæval sources, and the next year (1868) appeared the first volume of 'The Earthly Paradise,' a series of stories retold from classical and mediæval originals, but with a mediæval setting. A second and third volume followed in 1869 and 1870, the entire work comprising 24 tales with the addition of interludes and preludes and 12 lyrics of the months. In 'The Earthly Paradise,' as in the 'Jason,' Morris took Chaucer for his master as well in the structure of his verse as in what may be termed the processional nature of his descriptive passages. Three verse forms are employed by him, the seven-lined decasyllabic stanza known as the Chaucerian heptastich, the four-foot couplet and the heroic couplet. 'The Earthly Paradise' includes some 40,000 lines, but when once the reader has fallen under the poet's sway his leisurely manner will not be found wearisome. In 'The Lovers of Gudrun,' one of the tales of 'The Earthly Paradise,' Morris had already turned to Iceland for a theme and in 'The Story of Sigurd the Volsung and the Fall of the Niblungs' (1876) he returned to Icelandic myth for his subject. The poet regarded this poem as his masterpiece and in the opinion of not a few critics it ranks as almost the greatest, if not the greatest epic of the 19th century. In his hands the ancient myth becomes alive and throbs with all the intensity of primeval passion. Beside these works Morris published also in verse 'Love is Enough, or the Freeing of Pharamond' (1873); 'The Æneids of Virgil done into English verse' (1875), in which the metre adopted is that of Chapman's Homer; 'The Odyssey of Homer done into English verse' (1887); 'The Dream of John Ball' (1888); and 'Poems by the Way' (1892). In 1863 Morris began the manufacture of wall paper, stained glass, and artistic furniture, and to his labors in this particular is traceable much of the reform which English and American trade has experienced in household art during the last generation. In 1890 he established the Kelmscott Press at Hammersmith, and there published exquisitely printed editions of Chaucer, Beowulf and other works, as well as of his own writings. Still another side of his nature was shown in the trend of his human sympathies. He had long been known as poet and craftsman, but from 1885 he was active as a social reformer, lecturing frequently to workmen in halls or in the open air, and

helping to support the 'Commonwealth,' a socialist journal. It is not wholly easy to understand this side of his nature, for intensely democratic as he became, in theory at least, he was an equally intense lover of that very beauty which a social upheaval would destroy. The ugliness of much of modern life led him to socialism but he was thoroughly sincere in his attitude, illogical as it may seem to many. However difficult it may be to adjust satisfactorily to our minds the attitude of the poet-socialist with the character of his work as a craftsman, which was offered to the world at prices practically prohibitory for the majority of persons, it is an unquestionable fact that the world is a pleasanter, wholesomer world for his having lived in it. He helped his generation to perceive that there is no necessary alliance between utility and ugliness; he raised the standard of household taste, and as a poet he was one of the most melodious of his time. In his later years he essayed a form of composition in mingled prose and verse greatly enjoyed by many, though perhaps not wholly to the taste of those who liked him best as the author of 'The Earthly Paradise' and 'Sigurd'—a series of romances beginning with 'The Tale of the House of the Wolfings' (1880) and succeeded by 'The Roots of the Mountains' (1890); 'News from Nowhere' (1891); 'The Story of the Glittering Plain' (1891); 'The Wood beyond the World' (1894); 'The Well at the World's End' (1896); 'The Water of the Wondrous Isles' (1897). With Erikir Magnusson, the Icelandic scholar, he published 'The Story of Grettir the Strong' (1869); 'Volsunga Saga' (1870); and 'Three Northern Love Stories and Other Tales' (1875). Still other works by him are 'The Decorative Art' (1878); 'Hopes and Fears for Art' (1882); 'Signs of Change' seven lectures (1888); with Belfast Bax, 'Socialism: its Growth and Outcome' (1893); 'Architecture, Industry and Wealth' (1903). Morris' socialistic theories prevented his receiving the offer of the laureateship on the death of Tennyson, but that he would have accepted it is quite unlikely. He was a devoted admirer of mediæval architecture and his account in the 'Earthly Paradise' of the front of Peterborough cathedral is one of the finest descriptions of an architectural feature to be found in English literature. He wrote the excellent monograph on 'Mural Painting' in the ninth edition of the 'Encyclopædia Britannica.' Consult: Vallance, 'William Morris: his Art, etc.' (1897); Mackail, 'The Life of William Morris' (1899); Cary, 'William Morris, Poet, Craftsman and Socialist' (1902); Riegel, 'Die Quellen von William Morris's Dichtung, "The Earthly Paradise," in Erlanger Beiträge zur englischen Philologie' (1890).

Morris, William O'Connor, Irish jurist and author. He was educated at Oxford, was admitted to the Irish bar in 1854 and has been a county court judge from 1872. He is the author of 'Great Commanders of Modern Times'; 'Napoleon'; 'Moltke'; 'Irish History'; 'Hannibal'; 'Ireland: 1798-1898'; 'Present Irish Questions'; etc.

Morris, an island at the entrance to Charleston Harbor, S. C., south of the main channel. It is east of James Island, nearly a

mile south of Fort Sumter and about a mile and a half from Fort Moultrie. At Cummings Point, on the north end of the island, three small batteries took part in the bombardment of Fort Sumter, 12-13 April 1861. Later Battery Wagner was constructed on the south end of the island and the batteries on the north end were strengthened and called Battery Gregg. Attempts were made, in 1863, by the Union forces under Admiral Du Pont and General Hunter, to secure possession of the island, and later by Admiral Dahlgren and General Gilmore. A landing was made on 10 July and on the 11th and 18th an encounter took place, and a regular siege began. See **FORT SUMTER**.

Morris, Ill., city, county-seat of Grundy County; on the Illinois River, the Illinois and Michigan Canal, and on the Chicago, R. I. & P. railroad; about 60 miles southwest of Chicago. The first settlement was made in 1834, and in 1857 the town was incorporated. The surrounding country is a fertile agricultural region in which there are large bituminous coalfields. The principal manufactures are brick, tile, paper car-wheels, oatmeal, flour, and leather. The city has considerable trade in coal, live-stock, and grain. It is the seat of Saint Angela's Academy and has good public and parish schools. Pop. (1890) 3,653; (1900) 4,273.

Morris, Minn., village, county-seat of Stevens County; on the Great N. and Northern P. R.R.'s; about 160 miles west by north of Saint Paul. Good water is obtained from the Pomme de Terre River which is near. The chief product of the surrounding agricultural region is wheat. The principal manufactures of the village are flour and dairy products. There are several grain elevators, stock yards, and lumber and brick yards. The village has a good school and a public library. Pop. (1890) 1,266; (1900) 1,934.

Morris Brown College, in Atlanta, Ga.; a coeducational institution founded in 1880 under the auspices of the Methodist Episcopal Church. In 1902 there were in connection with the school 20 professors and instructors, and nearly 600 pupils. There were in the library 2,000 volumes. The grounds and buildings were valued at \$125,000 and the income about \$20,000.

Morris Dance, or **Moorish Dance**, supposed to have been derived from the Moriscos in Spain, was formerly danced at puppet-shows, etc. It was introduced into England in the reign of Edward III., when John of Gaunt returned from Spain. In the May-games of Robin Hood, morris-dancers formed an important part. In the reign of Henry VIII. the morris-dancers were dressed in gilt leather and silver paper, and sometimes in coats of white and spangled fustian.

Morris Park. See **HORSE-RACING**.

Mor'ison, Arthur, English author: b. 1863. He was for a number of years secretary to a charity-trust in London's East End, and there made the studies utilized in his 'Tales of Mean Streets' (1895); and 'The Child of Jago' (1896). He wrote also: 'Martin Hewitt, Investigator' (1896), detective stories; 'The Dorrington Deed-Box' (1897); 'To London Town' (1899); and other volumes.

MORRISON—MORRISTOWN

Morrison, Henry Clay, American Methodist (South) bishop: b. Montgomery County, Tenn., 30 May 1842. He was educated in the public schools and after teaching for several years entered the ministry in 1865. He has held important charges in Louisville, Ky., and Atlanta and was missionary secretary in 1890-8 when he raised \$140,000 for the Board of Missions. He was appointed bishop in 1898.

Morrison, James Dow, American Protestant Episcopal bishop: b. Waddington, N. Y., 1844. He was graduated from McGill University, Montreal, in 1865, took orders in the Episcopal ministry and after holding rectorates at Herkimer and Ogdensburg, N. Y., was consecrated first missionary bishop of the diocese of Duluth in 1897. He has published 'Fundamental Church Principles' (1899).

Morrison, John Tracy, American lawyer and politician: b. Jefferson County, Pa., 25 Dec. 1860. He was graduated from the University of Wooster, Ohio, in 1887, and from the law department of Cornell University in 1890. In the latter year he moved to Caldwell, Idaho, where he established his law practice. In the campaign of 1896 he was secretary of the Republican State Committee, and in 1896 and 1900 Republican candidate for Congress, but was not elected. From 1897 to 1900 he was chairman of the State committee, and in 1902 was candidate for governor of Idaho, and was elected for a two years' term.

Morrison, Robert, English missionary and Orientalist: b. Morpeth, Northumberland 5 Jan. 1782; d. Canton, China, 1 Aug. 1834. In 1807 he embarked as a missionary for Canton, in 1808 was appointed translator to the East India Company's factory at Canton, and in 1810 began to print the New Testament in Chinese from a text which he had carefully revised. In 1811 he completed a 'Chinese Grammar,' published in 1815. In 1814 he completed the New Testament, and with the assistance of Dr. Milne, who had joined him in 1813, the translation of the Old Testament. This was completed in 1818. In 1815 he completed a 'Chinese Dictionary,' published in 1821, at the expense of the East India Company. Dr. Morrison and his colleagues superintended very extensive printing operations for the diffusion of tracts and Scripture portions among the Chinese. Besides the works mentioned he wrote 'Horæ Sinicæ, or Translations from the Popular Literature of the Chinese' (1812); 'Dialogues translated from Chinese into English' (1816); 'A View of China for Philological Purposes,' (1817); and several educational works in English and Chinese. Consult his 'Mémoir' (1839); Townsend, 'Robert Morrison' (1888).

Morrison, Theodore Nevin, American Protestant Episcopal bishop: b. Ottawa, Iowa, 18 Feb. 1850. He was graduated from Illinois College, Jacksonville, Ill., in 1870, studied for the ministry at the General Theological Seminary, and took priest's orders in the Episcopal Church in 1874. After being rector of St. Paul's Church, Pekin, Ill., 1874-6; and of the Church of the Epiphany in Chicago, 1876-99, he was consecrated bishop of Iowa in February 1890.

Morrison, William Ralls, American lawyer: b. Monroe County, Ill., 14 Sept. 1824. He

was educated at McKendree College, Lebanon, Ill., and served as a private in the Mexican War. In 1852-4 he was clerk of the circuit court of Monroe County and in 1854 was elected to the State legislature. His admission to the bar came in 1855 and he continued in the legislature until 1859, holding the speakership in the latter year. He served in the Civil War 1861-3 receiving the rank of colonel and was member of Congress in 1863-5 and in 1873-87. He introduced the Morrison tariff measure and several other bills and in 1887-97 served as member of the interstate commerce commission of which he was chairman after 1891.

Morrison, Ill., city, county-seat of Whiteside County; on the Chicago and Northwestern railroad; about 120 miles west of Chicago. It is situated in an agricultural and stock-raising region. The industrial establishments are furniture and carriage factories, school furniture and refrigerator factories, flour mills, and creameries. It has considerable trade in dairy products, live-stock, and manufactures. The city has a public library and a museum. Pop. (1890) 2,088; (1900) 2,308.

Morriso'nians. See EVANGELICAL UNION.

Morristown, N. J., city, county-seat of Morris County; on the Delaware, L. & W., the Whippany R., and the Rockaway V. R.R.'s; about 16 miles west of Newark. It is situated in an agricultural region in which market gardening and fruit growing receive considerable attention. It was settled in 1709-10 and was called West Hanover. In 1740 the name was changed to Morristown in honor of Lewis Morris (q.v.) then colonial governor of New Jersey. It was incorporated in 1865. It is about 700 feet above sea-level and overlooks a beautiful section of country. The place figured prominently in the Revolution; in 1777, from January to May, and from December 1779 to June 1780, Morristown was Washington's headquarters. The old Ford mansion, which he occupied, is now owned by the "Washington Association" who preserve here numerous mementoes of Revolutionary and pre-Revolutionary times. It was here that Samuel F. B. Morse (q.v.) and his associate, Alfred Vail, worked on the electric telegraph experiments about 1837. The shaft of the Savannah, the first steamboat to cross the Atlantic, was cast at the old Speedwell Iron Works.

Morristown is largely a residential city; its climate, scenery, and easy access to the cities of New York, Jersey City, and Newark make it a most desirable location for the homes of city business men. It has considerable trade and ships considerable quantities of flowers, fruit, and vegetables. Some of the prominent buildings are the Young Men's Christian Association and the Young Men's Catholic Association buildings, and All Soul's and the Memorial hospitals. There is a beautiful and well-kept park, in which a soldiers' monument has been erected. A monument marks the site of Fort Mifflin, erected by Washington. The city has public and parish schools, and a public library and lyceum. At Morris Plains, about four miles northeast of the city, is a State hospital for the insane, which has accommodation for about 1,500 patients, and which cost about \$3,000,000. Pop. (1890) 8,150; (1900) 11,267.

MORRISTOWN — MORSE

Consult: Tuttle, 'History of Morristown'; Colles, 'Authors and Writers Associated with Morristown' (1893).

Morristown, Tenn., city and county-seat of Hamblen County, about 40 miles northeast of Knoxville; on the Southern and the Morristown & C. R.R.'s; situated in a fertile agricultural region, of which it is the business centre. It has manufactures of tobacco, flour, wagons, agricultural implements, stoves, lumber, etc. It is also a large stock-market, and the iron and lead mines and marble quarries in the vicinity add to the importance of its industrial interests. It is the seat of the Morristown Normal College for negroes. Pop. (1890) 1,999; (1900) 2,973.

During the Civil War Morristown was the scene of two engagements. On 10 Dec. 1863 Col. Garrard's Union cavalry brigade attacked Gen. W. E. Jones' cavalry brigade in works here, and drove it out of them and from the town. Four days later Col. W. J. Palmer, commanding the Anderson (Pa.) cavalry, had a skirmish near the town with a part of Gen. Martin's cavalry brigade of five regiments, and withdrew leaving Martin in possession of the place. On 28 Oct. 1864 the town was held by Gen. John C. Vaughn's brigade of Confederate cavalry. Vaughn was attacked that day by Gen. A. C. Gillem, with a brigade of Union Tennessee cavalry. Vaughn was falling back to a more favorable position, when Gillem charged his right and centre and stampeded the entire brigade, which fell back in disorder to Russellville. Gillem took 224 prisoners, including 19 officers, four guns and caissons, part of the ammunition train, and about 300 stand of small arms. The Union loss was 8 killed and 18 wounded. E. A. CARMAN.

Morro (môr'rô) **Castle**, a former Spanish fort at the entrance to the harbor of Havana, Cuba; also the name of an imposing fortification on the cliffs overlooking Santiago Bay. It was in sight of this fort and under fire of its guns that Lieutenant Hobson and seven men of the United States navy, on 3 June 1898, sank the Merrimac at the entrance to the harbor to prevent the Spanish fleet from escaping. See CUBA; HAVANA; SPANISH-AMERICAN WAR.

Mors, or **Morsøe**, Denmark, the principal island of the Limfjord in the northwest of Jutland, 23 miles long, 11 miles broad, and with an area of 140 square miles. Capital, Nykjøbing on the east coast. The island reaches a maximum altitude of 250 feet and its shores are marked by precipitous cliffs. It is of great fertility, affording a strong contrast with the adjacent mainland. Pop. (1901) 22,237.

Morse, môrs, **Edmund Sylvester**, American naturalist and Orientalist: b. Portland, Maine, 18 June 1838. He was educated at the Lawrence Scientific School, Harvard University; taught zoology and comparative anatomy at Bowdoin College 1871-4, and at the Imperial University of Tokio, Japan, 1877-80; and in this way added to his reputation as a zoologist a remarkable intimacy with Chinese and Japanese art, especially ceramics, and with the folklore and early archaeology of the two countries. His collection of Japanese pottery is now in the Boston Museum of Fine Arts; it keeps his name and he is its curator. In 1881 Morse became director of the Peabody Academy of Sciences, of

which he was one of the founders. He wrote: 'Early Stages of Terebratulina' (1870); 'Embryology of Terebratulina' (1872), and other studies showing the non-molluscan character of the brachiopods; 'First Book in Zoology' (1875, and in German and Japanese versions); 'Early Races of Man in Japan' (1879); 'Japanese Homes and their Surroundings' (1886); 'Older Forms of Terra-Cotta Roofing Tiles' (1892); an illustrated 'Catalogue of the Morse Collection' (1901); and 'Glimpse of China and Chinese Homes' (1902).

Morse, Jedidiah, American Congregationalist clergyman and geographer: b. Woodstock, Conn., 23 Aug. 1761; d. New Haven 9 June 1826. He was graduated from Yale in 1783; studied theology under Jonathan Edwards; was licensed to preach in 1785, but spent more time in teaching and in geographical studies than in preaching until 1787; was pastor at Charlestown, Mass., from 1789 to 1820; and spent his last years in New Haven. He was intensely orthodox; established in 1805 the 'Panoplist', a religious journal combating Universalist views; took a prominent part in Christian work among the New England Indians; and was an able and successful teacher. He wrote: 'A Compendious History of New England,' with Elijah Harris (1804); 'Annals of the American Revolution' (1824), and a series of excellent geographies, including 'Geography Made Easy' (1784); 'American Gazetteer' (1789); and 'Elements of Geography' (1797).

Morse, John Torrey, American historian: b. Boston 9 Jan. 1840. He was graduated from Harvard in 1860, and was lecturer on history there from 1876 to 1879. For two years he was associated with Henry Cabot Lodge in the editorship of the 'International Review.' He also studied and practised law in Boston for a time. His literary work has been chiefly in historical biography, and he has edited the 'American Statesman' series, which is ranked among the best biographical works for the interpretation of American history. For this series he has written: 'Abraham Lincoln' (1893); 'Benjamin Franklin' (1889); 'John Adams' (1884); 'John Quincy Adams' (1883); and 'Thomas Jefferson' (1883); his other works include: 'Treatise on Law Relating to Banks and Banking' (1870); 'Law of Arbitration and Award' (1872); 'Famous Trials' (1874); 'Life of Alexander Hamilton' (1876); and 'Life and Letters of Oliver Wendell Holmes' (1896).

Morse, Leopold, American merchant and politician: b. Wachenheim, Bavaria, 15 Aug. 1831. In early life he emigrated to the United States and identified himself with Boston's progress, attaining a high degree of popularity by his public spirit and personal energy. He was elected as a Democrat to the 45th, 46th, 47th, 48th, and 50th Congresses from Massachusetts.

Morse, Samuel Finley Breese, American inventor and artist: b. Charlestown, Mass., 27 April 1791; d. 2 April 1872. He was the eldest son of the Rev. Jedidiah Morse (q.v.). After graduating at Yale in 1810, he visited England with Washington Allston (q.v.) to study painting. In 1813 his first attempt at sculpture, a 'Dying Hercules,' won for him the gold medal of the Adelpi Society, and he received the

MORSE

same from the hands of the Duke of York. He returned to New York in 1815, and in 1824-5 organized an association which became the present National Academy of Design. He was its first president and continued in office for 16 years. He again spent three years in study in Europe, and then returned to New York to take the professorship in the University of the City of New York.

Morse had always been fond of the study of chemistry and natural philosophy, and it became at last a dominant pursuit with him. In consequence of his intimacy with Prof. J. Freeman Dana, who was lecturing in the same institution on the electro-magnet, Morse became interested in electrical matters, and in 1832, while returning home from Havre on the packet ship Sully, he first conceived the idea of the telegraph. But though thus early devised, yet circumstances prevented the complete construction of the first recording apparatus in New York until 1835, when he exhibited it at the New York University building. In 1837 he made another and more perfect exhibition, and filed his caveat at Washington. He now considered his apparatus sufficiently perfected for commercial introduction, and in 1838 he asked Congress to construct an experimental line from Washington to Baltimore to show its practicability. From the skepticism of many and the ridicule of others, Morse's request was not acted upon by Congress, and, disappointed and almost disheartened, he repaired to England in hopes of getting some foreign government to aid him. The result of this visit was a refusal to grant him letters patent in England, and the obtaining of a useless *brevet d'invention* in France. For four years he struggled and put up with many privations, and, as if it were designed to try him up to the last moment, no recognition of the matter was taken till the last night of the Congressional session. He retired to bed disheartened and discouraged before the session was closed. But in the morning—the morning of 4 March 1843—he was startled with the announcement that the desired aid of Congress had been obtained in the midnight hour of the expiring session, and \$30,000 placed at his disposal for his experiment between Washington and Baltimore. In 1844 the work was completed, and demonstrated to the world the practicability and the utility of the Morse system of the electro-magnetic telegraph. The first message, "What hath God wrought?" was sent from the United States Supreme Court room in the Capitol at Washington to Baltimore, 24 May 1844. From that day the telegraph was a success.

Honors were showered upon him by European sovereigns and governments. Probably no American has ever received so many marks of distinction. In 1848 Yale College conferred on him the complimentary degree of LL.D., and in the same year he received the decoration of the *Nishan Iftichar* in diamonds from the sultan of Turkey. Gold medals of scientific merit were awarded him by the king of Prussia (set in a massive gold snuff box), the king of Württemberg, and the emperor of Austria. From the emperor of the French he received in 1856 the cross of chevalier of the legion of honor; in 1857 from the king of Denmark the cross of knight of the Dannebrog; and in 1858 from the queen of Spain the cross of

knight commander of the Order of Isabella the Catholic. The sum of 200,000 francs was presented to him jointly by the principal governments of Europe. It has been said that much of this money was spent in the ceaseless litigation and law suits in which he was involved in the defense of his patent rights.

Prof. Morse also had the distinction of laying the first submarine telegraph line, which was done in New York harbor in 1842. He likewise set up the first daguerreotype apparatus and was associated with John W. Draper in taking the first daguerreotypes in America. A letter from Prof. Morse to the secretary of the treasury in 1843 seems to contain the earliest suggestion of the possibilities of an Atlantic cable. His last public act was the unveiling of the statue of Benjamin Franklin, in Printing House Square, New York. Consult Prime, 'Life of S. F. B. Morse' (1875).

Morse, Sidney Edwards, American journalist and inventor, son of Jedidiah Morse (q.v.), and brother of S. F. B. Morse (q.v.): b. Charlestown, Mass., 7 Feb. 1794; d. New York 24 Dec. 1871. He was graduated at Yale in 1811; studied law; established the 'Boston Recorder' in 1815 and the 'New York Observer' in 1823, the pioneers of American religious journalism; invented a flexible piston-pump in 1817 and the cerographic method of printing maps in 1839; improved a bathometer for deep-sea soundings; and, like his father, was an able and successful geographer. He published several popular atlases and school geographies.

Morse, Sidney H., American sculptor and editor: b. Rochester, N. Y., October 1832; d. San Mateo, Fla., 18 Feb. 1903. In youth he worked at marble-cutting, and acquired a taste for sculpture. Later he studied at Antioch College, and afterward began to preach in Unitarian pulpits in the West; still later made further preparation for the ministry at Harvard, and for some time was settled in Haverhill, Mass. In 1865 he became editor of the 'Radical,' published in Boston as "a medium for the freest expression of thought on all religious and social topics," and conducted it with eminent ability until 1872. The 'Radical' was a worthy successor, after a long interval, of the famous 'Dial' (q.v.), and Morse counted among his friends and contributors Emerson, A. B. Alcott, Samuel Johnson, Samuel Longfellow, and many others prominent in literature and reform, leaders in the progressive movements of the time. A man of genius and of winsome personality, he devoted himself through his magazine, with heroic self-sacrifice, to a task which appreciably furthered the aims of America's foremost thinkers and workers. When he discontinued the 'Radical' he turned with enthusiasm to sculpture, and produced many notable works. He made a bust of Emerson, which is in the Second Church, Boston, the present edifice of the society to which Emerson ministered (1829-32), and another of the same subject, accepted by Emerson's friends as the best extant. His other subjects include Channing, Parker, James Martineau, Walt Whitman, Carlyle, Thomas Paine, Lincoln, Holmes, and many besides. During President Cleveland's first term he gave sittings to Morse for a statuette. In addition to his art

MORSÖE—MORTAR

work Morse wrote much for periodicals. One of his poems, 'Sundered,' is to be found in Emerson's 'Parnassus,' and a later writer says that if Emerson had known Morse as some knew him "he would have niched him in his gallery of heroes." Morse was also a welcome lecturer on many platforms, being equally gifted with voice and hand to instruct and entertain.

Morsöe, mörs-é-ë. See MORS.

Mortality, a term applied to that branch of investigation which determines the proportion of the number of persons who die in any assigned period of life or interval of age, out of a given number who enter upon the same interval, and consequently the proportion of those who survive. Tables showing how many out of a certain number of infants, or persons of a given age, will die successively in each year till the whole become extinct, are generally called tables of mortality. There is no fixed number of lives upon which such tables are based, but the observation of a large number is indispensable to accuracy, and the larger the number that can be duly observed the greater will be the degree of accuracy attained. It must always be borne in mind, however, that a strict observation of a moderate number will yield truer results than a looser induction from a larger number. The basis of such calculations must be an accurate register of the number of births and deaths, and in the case of the latter, at what ages, in a given district or extent of country.

In Great Britain the bills of mortality, or abstracts from parish registers, were long the only means of arriving at these results; but being found very imperfect and unsatisfactory, they were supplanted in 1836 by a general registration. The results furnished by such tables are very various, and of great interest. The registers, if kept with sufficient accuracy and minuteness, enable us to determine the proportion of deaths, not only at different ages and in different regions, but at different seasons, in persons of different occupations and habits, in towns, or the country; and thus afford valuable materials for the science of political economy. Although much more attention has been paid to this subject in recent times, yet the observations have not been so extensive nor so accurate as is desirable.

Although the collection of regular statistics of mortality is of recent origin, the subject has always excited much interest, and many general facts have been collected regarding it. The tendency of mortality to diminish with the progress of civilization has been satisfactorily established by statistics. The average rate of mortality is affected by regular or constant causes, such as race, climate, age, sex, profession, social position, density of population, political institutions, habits, etc., and by such irregular or occasional causes as war, famine, pestilence, etc., but notwithstanding the interruption of these occasional causes a constant tendency to a mean has been found to exist in any given state of society. The fact that the tendency of population to increase or diminish is quite independent of the rate of mortality was first established by Malthus, who showed that the increase of population depended on the facility of procuring the means of subsistence and not on the duration of life. The mortality in the United

States, for example, is greater than in England, yet the population of the United States doubles itself in 25 years, and that of England in 43 years, while in various European countries which have a lower mortality than the United States, the population will not double in a century.

Some statisticians have attached considerable importance to the effects of race on population. It is extremely difficult, however, to establish anything in regard to race independently of circumstances and social habits. It has been shown, for example, that the average mortality among the Jews in Prussia is less than among the Christians, that the mortality varies greatly among the various races who inhabit the Austrian Empire, being least among the Germans, and that a similar difference prevails in the departments peopled by various races in France, but all such evidence is open to the most obvious exceptions. The influence of climate on mortality is inseparably associated with that of migration. It cannot be established that any climate, except perhaps the extremes of heat or cold, moisture or dryness, is in itself exceptionally favorable or unfavorable to human life, but change of climate is frequently adverse to it.

The most remarkable fact in respect to age is the great mortality which commonly takes place among children under five years of age. This is especially remarkable in large towns, but is not wholly confined to them. Although the diseases to which infancy is liable may naturally account for part of this excessive mortality, the greater part of it must be attributed to ignorance and want of due care in the training of children, partly arising from the unfavorable circumstances in which, through the too rapid increase of population, they are brought into the world. This is both directly and indirectly a considerable cause of the extra mortality of large towns and other dense centres of population. The question whether city or country life is most conducive to a low rate of mortality is still undecided. Direct statistics prove nothing, as the death-rate of towns is raised by immigration from the country and other causes. In regard to sex it is established that women live longer than men, and that among men the married live longer than the single. The condition of life in respect of poverty or wealth is known to have a considerable influence on mortality. Dividing France into two classes, rich and poor, the annual mortality was found to be 1 in 46 in the former, and 1 in 33 in the latter. This gave to the rich an average duration of life of 57 and to the poor one of 37 years. See **LONGEVITY**; **VITAL STATISTICS**.

Mortar, a calcareous cement used in building. It differs in its characteristics according to the nature, proportions, or treatment of its constituents. The proportions vary from 1½ to 4 or 5 of sand to 1 of lime. Hydraulic mortar is made from certain limestones which include in their composition so large a proportion of iron and clay as to enable them to form cements which have the property of hardening under water, and are called hydraulic limestones. The proportions of clay vary in different quarries, and often in the same from 8 to 25 per cent. See **CEMENT**; **LIME**.

MORTAR—MORTMAIN

Mortar, or **Morter**, a vessel of iron, porcelain or stone used by pharmacists and others in preparing powders and other medicines. Also a piece of ordnance. See **ORDNANCE**.

Mortara, môr-tä'rá, **Edgar**, Jewish boy whose forcible removal from his parents by the orders of the Archbishop of Bologna in 1858 aroused great excitement in Europe. The plea made in justification of the act was that Mortara had been early baptized into Christianity by a Roman Catholic maid-servant. The Roman Catholic authorities, however, declined to return him; and despite the many protests in the matter, he remained, of his own choice, with the Church and entered the Augustinian order.

Morte d'Arthur, môrt dâr'thër. See **ARTHURIAN LEGENDS**.

Morten-Müller, môr'tën-mûl'lër, Norwegian painter: b. Holmestrand, Christianiafiord, 29 Feb. 1828. He began to study art in Dusseldorf (1847) first under Tidemand and Eude, and later as a pupil in the Academy under J. W. Schirmer. He removed to Stockholm in 1850, but in 1866 opened an art school in Christiania under government patronage. He returned to Dusseldorf in 1871 and devoted himself to setting forth the wild scenery of his native country in a series of vast canvases. Fiord, valley, and mountain height are represented with fine imaginative yet truthful line and color. The most noteworthy of his landscapes are: 'Norwegian Landscape' and 'Entrance to Hlardangerfiord' (both in the National Gallery of Christiania); 'A Fir Forest' (in the Gallery at Hamburg); 'Romsdalfiord,' with historical figures put in by Tidemand (1876); 'Start of the Fishing-boats by Night'; 'Waterfall and Pine Forest' (1879); 'Fisherman's Cot in Christianiafiord' (1880); 'Woodland Lake by Moonlight' (1892). His works combine romantic picturesqueness with color power of startling realism. In 1874 he was appointed court painter and member of the Stockholm Academy.

Mortgage, môr'gāj, in law, the conveyance of property as security for the payment of a debt on the condition that if the debt be duly paid the conveyance shall be void. The term is applied: (1) To the act of making such a conveyance; (2) to the deed by which such conveyance is made; (3) to the rights thereby conferred on the mortgagee. He who makes the mortgage is the mortgagor; he for whose benefit it is made is the mortgagee. Whatever may be sold may be mortgaged. Mortgages may therefore cover chattels or real estate. Mortgages must be in writing, either in one single instrument containing the whole case, or in two, one containing the conveyance, the other the condition of the conveyance, this last document being the "defeasance." A deposit of title-deeds, with a verbal agreement, creates an equitable mortgage in some States which recognize this proceeding as a mode of securing a debt. The different States regulate the time in which mortgages are to be recorded, in order to protect innocent purchasers, but an unrecorded mortgage is good as against the mortgagor, or any purchaser knowing of its existence at the time of his purchase. In those States which recognize chattel mortgages (or mortgages of personal property), a record of

the same within a specified time is required, to render them valid as against other claimants. See also **FORECLOSURE**.

Mortgage Banks, were originally planned to furnish credit funds on houses, lands, mines and other property. These mortgage loans are for periods of from 10 to 75 years. Such banks are found in most European countries. Those of France are perhaps best known, among them being the *Crédit Foncier*. There are no banks of this character in the United States, loans being mostly made through individual bankers or brokers.

Mortification. See **GANGRENE**.

Mortimer, môr'ti-mër, **John Hamilton**, English artist: b. Eastbourne, Sussex, 1741; d. 1779. After studying under Sir Joshua Reynolds he carried off the first prize of the Society of Arts, London (1763). He was elected R. A. in 1779. A bold and vigorous draughtsman, and a good colorist, he was fond of dramatic scenes in which there was an element of the terrible. His style and manner are well exemplified in the pictures 'Battle of Agincourt'; 'Vultigern and Rowena'; 'Hercules Slaying the Hydra'; now in the South Kensington Museum. He was very successful as an etcher and designed stained glass for Salisbury Cathedral and Brazenose College, Oxford.

Mortimer, **Roger**, Baron of Wigmore, earl of March; English noble: b. about 1287; d. Smithfield, 29 Nov. 1330. He had been convicted of treason in the reign of Edward II. and pardoned; but notwithstanding the king's clemency took part in the rebellion of the earl of Lancaster, and was made prisoner in 1322. Having escaped from the Tower, where he was confined, he went to France and at Paris in 1325 met Queen Isabella, who had been sent thither by Edward to negotiate a treaty. Fascinated by his pleasing address, the queen was soon known to be living in guilty intimacy with the exile, and, having secured the person of her young son, began to mature plans with Mortimer and the other leaders of the barons for getting possession of the kingdom. Mortimer went with her to England in 1326; the king was deposed, and his son Edward III. proclaimed in his stead, and for some years Isabella and her paramour governed the realm in the name of the young prince. Mortimer procured the death of the dethroned monarch in his prison, but he was denounced from the pulpit; the nobles wearied of his arrogance, and Edward resolved to take the sceptre into his own hands. While the queen and Mortimer were in Nottingham castle during the session of parliament at that town, the king and Lord Montacute with attendants entered by night through a subterranean passage, and carried off the earl. The king summoned a new parliament to meet him at Westminster, and on 26 Nov. Mortimer was condemned by this parliament and executed three days later.

Mortmain, môrt'mân, in English law, lands held by a corporation were said to be held in mortmain (*mortua manu*, by dead hand), because they were then not alienable. The expression has particular reference to estates held by religious and eleemosynary corporations in England. The law on this subject was consolidated by the Mortmain and

MORTON

Charitable Uses Act (1888), under which no bequest for a charitable purpose was to involve the acquisition of land. The act of 1891 enacted that land may be devoted to any charitable use, but it must be sold within a year from the testator's death, unless the time be extended by certain authorities. It also permits the acquirement of land directed to be acquired for a charity if the court or the charity commissioners consent. A large number of acts from 1841 onward have exempted from mortmain restrictions land bequeathed for school sites, burial-places, places of worship, literary and scientific institutions, public parks, but maximum limits are imposed in several cases.

Morton, or Mourt, George, Puritan colonist: b. York, England, about 1585; d. 1628 (?). He affiliated himself with the Puritans in 1600 and settled in Holland, but was for some years previous to 1820 London agent for the Puritans. Authorities disagree as to his career, some placing his emigration to America in 1620 while others fix it at 1623, and the same uncertainty prevails as to his death, the dates varying from 1624 to 1628, and there is no conclusive evidence as to whether it occurred in England or America. For many years he was credited with the authorship of Mourt's 'Relation or Journall of the beginning and proceedings of the English Plantation at Plimoth,' published in London in 1622. Careful investigation, however, seems to prove conclusively that the authorship must be credited to Winslow and Bradford and that at most only a small portion of it can be claimed by Morton. The work which is regarded as the most authentic history of the times in existence has been several times reprinted. Consult: 'Mourt's Relation,' with introduction and notes by Henry Martyn Dexter.

Morton, Henry, American scientist: b. New York 11 Dec. 1836; d. there 9 May 1902. He was graduated from the University of Pennsylvania in 1857 and after taking a post-graduate course in chemistry turned his attention to law, but finding scientific work more to his liking he abandoned law to become professor of physics and chemistry at the Episcopal Academy of Philadelphia in 1860. His lectures in 1863 at the Franklin Institute in Philadelphia attracted attention throughout the United States and Europe by reason of his brilliant and unique experiments. He was one of the founders of the Philadelphia Dental College in 1863, and its first professor of chemistry and in 1864-70 was resident secretary at Franklin Institute where he continued his lectures. In 1867 he was appointed professor of chemistry at the University of Pennsylvania and in the same year became editor of the Franklin Institute 'Journal.' He conducted the photographic branch of the United States eclipse expedition to Iowa in 1869, and in addition to securing several excellent photographs of the eclipse proved that the bright line on the sun's disk adjacent to the moon is due to a chemical action in the process of developing the plate and not to diffraction as had hitherto been held by the best scientists. In 1870 he was chosen president of the newly founded Stevens Institute of Technology and under his direction the faculty was selected and the course of instruction formed. His management of the institute made

it one of the leading technological schools of the country; he gave it the benefit not only of his great learning but also several munificent gifts in the establishment and endowment of various necessary departments. His reputation as a scientist became world-wide and his services as a chemical expert were eagerly sought in court. In 1878 he was appointed to the United States Lighthouse Board and in 1876-81 he was president of the American Chemical Society. Besides articles contributed to encyclopædias he wrote numerous papers on electricity and fluorescence and assisted in the preparation of 'The Student's Practical Chemistry' (1868).

Morton, James Douglas, 4TH EARL OF, regent of Scotland: b. Dalkeith, Scotland, about 1530; d. Edinburgh 3 June 1581. He married a daughter of the third earl and succeeded to the earldom on the death of his father-in-law, in 1553. He became Lord High-Chancellor of Scotland ten years later, but fled to England in 1556 on account of his share in the murder of Rizzio. He was soon pardoned and was one of the leading opponents of Bothwell; was again made chancellor, and in 1572 regent of the kingdom. Having made himself many enemies by maladministration, he resigned, but recovered authority not long after. His enemies, however, at length proving too strong for him, he was charged as accessory to the murder of Darnley, tried, condemned, and beheaded by the decapitating instrument he himself had introduced into Scotland.

Morton, James St. Clair, American soldier: b. Philadelphia, Pa., 24 Sept. 1829; d. Petersburg, Va., 17 June 1864. He was graduated from West Point in 1851, was appointed to the engineering corps, and in 1855-7 was assistant professor of engineering there. He was in charge of the Chiriqui expedition in Central America in 1860 and later superintended the work on the Washington aqueduct. In 1861 he was in command of the fortification at Tortugas and in May 1862 was appointed chief engineer of the Army of the Ohio. In October 1862 he was promoted brigadier-general and was transferred to the Army of the Cumberland as chief engineer in command of the bridge-brigade. He built the intrenchments around Murfreesborough, Tenn., and was engaged in the battles at Chattanooga and Chickamauga. He was chief engineer of the Ninth army corps in the Richmond campaign of 1864 and was killed in the battle of Petersburg. He published: 'An Essay on Instruction in Engineering' (1856); 'Mémorial on Fortification' (1858); 'Life of Maj. John Saunders, of the Engineers' (1860); etc.

Morton, John, English prelate: b. Milborne, St. Andrew, Dorsetshire, England, about 1420; d. Knoll, Kent, 15 Sept. 1500. He studied at Balliol College, Oxford, and subsequently became principal of what is now Christ Church College. He adhered with great fidelity to Henry VI., but nevertheless Edward IV. made him Master of the Rolls and Bishop of Ely (1478). Richard III. imprisoned him, but he escaped to Flanders and under Henry VIII. became Archbishop of Canterbury and chancellor (1486). In 1493 he became a cardinal.

Morton, John, one of the signers of the Declaration of Independence: b. Ridley, Delaware County, Pa., 1724; d. 1777. After working

MORTON

for several years as a surveyor, he began the practice of law. In 1764 he was elected to the general assembly of Pennsylvania, of which he became a conspicuous member, serving for a number of years and being speaker from 1772 to 1775. In 1765 he was a member of the Stamp Act congress; in 1766 became sheriff in his county, and was shortly afterward appointed one of the judges of the supreme court of Pennsylvania. He was always an earnest advocate of the rights of the colonies and warmly supported the Revolutionary War. In 1774 he was elected a delegate to the 1st Continental Congress, and was a member of that body till his death, taking active part in its debates and in the framing of the Articles of Confederation. He gave the casting vote of Pennsylvania in favor of the Declaration of Independence, the four other delegates present from that State being equally divided as to the measure; and affixed his signature to the Declaration.

Morton, Julius Sterling, American agriculturist: b. Adams, N. Y., 22 April 1832; d. Lake Forest, Ill., 27 April 1902. He was graduated from Union College in 1854 and removed to Nebraska City in 1855 where he was editor of the *Nebraska City News*. In 1856-7 he was a member of the territorial legislature and in 1858 secretary of the territory. Upon the resignation of Governor Richardson in 1858 he acted as governor and in 1893-7 was secretary of agriculture under President Cleveland. He was the originator of Arbor Day and an active member of various agricultural and horticultural societies.

Morton, Levi Parsons, American banker and politician: b. Shoreham, Vt., 16 May 1824. He received an academic education, and in 1843 established a mercantile business at Hanover, N. H.; in 1850 entered the banking business in Boston; and later removed to New York, where in 1863 he founded the large banking firm of Levi P. Morton & Company (later Morton, Bliss & Company), which assisted in floating the government war loan during the Civil War. He has also established a branch of his firm in London, and the Morton Trust Company of New York, and has gained a reputation as an able financier. He was elected to Congress on the Republican ticket in 1878 and served one term (till 1881); he was then appointed United States minister to France, where he remained till 1885; in this capacity he secured legal status in France for American corporations. In 1888 he was elected Vice-President of the United States, and made an especially able presiding officer in the Senate. In 1894 he was elected governor of New York State, serving for one term; in the last year of administration he urged in a special message the abolition of the ward-trustee system of school government in New York city public schools, and signed the bill which enforced this reform. In 1896 he was New York State's candidate for the Presidency at the National Republican Convention.

Morton, Marcus, American politician: b. Taunton, Mass., 8 April 1819; d. Andover, Mass., 10 Feb. 1891. He was graduated from Brown University in 1838 and studied law at Harvard receiving admission to the bar in 1841. He practised law in Boston until 1850 when he established a permanent practice in Andover. He was elected to the Massachusetts House of Representatives in 1858 and was appointed to the

superior court of Suffolk County in that year and in 1859 became justice of the superior court of the State. In 1869 he was appointed associate judge of the supreme court of the State and in 1882 became chief justice, resigning in 1890.

Morton, Nathaniel, American historian: b. Leyden, Holland, about 1613; d. Plymouth, Mass., 29 June 1685. He was of English descent, came with his father to Plymouth in 1623, became an inmate of Governor Bradford's family and his public assistant, and from 1645 until his death was secretary of the colony. In compliance with the request of the commissioners of the New England colonies, he compiled (1669) and published his principal work, 'New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England.' For nearly two centuries, or until Bradford's 'History of Plymouth' was discovered in 1855, Morton's work was the principal authority on the matters it dealt with. He compiled it largely from Bradford's manuscripts and Edward Winslow's journals. 'New England's Memorial' was several times reprinted in the American colonies, and was also reproduced in England. Besides various other works, Morton was also the author of 'A Synopsis of the Church History of Plymouth' (1680).

Morton, Oliver Perry, American statesman: b. Salisbury, Wayne County, Ind., 4 Aug. 1823; d. Indianapolis 1 Nov. 1877. He studied law, was admitted to the bar in 1847, and began the practice of his profession in Centreville, Ind. He had been a Democrat, but became one of the leaders of the new Republican party and was defeated as its candidate for governor in 1856. Four years subsequently he was elected lieutenant governor and when in January, 1861, Governor Lane was elected to the National Senate, Morton became governor. His active loyalty to the government did much to sustain the administration during the trying times of the Civil War. At its outbreak he at once sent troops to the field, but in the next year was greatly hindered in his efforts by a hostile legislature and subsequently by the efforts of a secret, disloyal society known as the Knights of the Golden Circle. Nevertheless he surmounted all obstacles and his services to the nation were thankfully recognized by its chiefs. He was elected a United States Senator from Indiana as a Republican in 1867, serving till 1877, and in the latter year was a member of the Electoral Commission. Consult 'Life,' by Foulke (1899).

Morton, Samuel George, American anatomist: b. Philadelphia, Pa., 26 Jan. 1799; d. there 15 May 1851. He studied medicine at the University of Pennsylvania and in Edinburgh; began to practise in Philadelphia in 1824; was immediately prominent in the Academy of Natural Sciences, being its secretary 1825 and its president 1850; became professor of anatomy in Pennsylvania College in 1839; and made special studies of ethnology, craniology and plant physiology. His valuable collection of skulls, numbering 1,500 specimens, 900 human, led him to urge the diverse origin of the human race. He contributed to Silliman's 'Journal,' and published 'Crania Americana' (1839); 'Crania Egyptica' (1844); and 'Illustrated System of Human Anatomy' (1849).

MORTON—MOSAIC

Morton, Thomas, English colonist in America: b. England about 1575; d. Agamenticus (or Acomenticus), Maine, 1646. He was an attorney of Clifford's Inn, London, and seems to have practised mainly in western England. In 1622 he landed in New England, where he remained three months; and in 1625 returned with Wollaston's company. Wollaston soon after left for Virginia, and in the summer of 1626 Morton assumed control over those of Wollaston's following that remained. The settlement, Mount Wollaston (now Braintree, Mass.), near the coast, he called Marc Mount (Merry Mount); and in the spring of 1627 he erected a May-pole, and with the "salvages" proceeded to hold May-day to the scandalizing of their Puritan neighbors of Plymouth. Contrary to law, he supplied the Indians with firearms and instructed them in their use; and he was a rival of the Plymouth settlers in the fur-trade. He was accordingly arrested by Captain Miles Standish, and sent back to England (1628). But in August 1629 he was again in New England. In August or September 1630 he was a second time arrested and banished. He published in 1637, 'New English Canaan,' which Nathaniel Morton ('New England's Memorial') denounces as "full of lies and slanders, and full fraught with profane calumnies," but which as a satire is sometimes not unamusing, and contains information of interest regarding local features and the Indians. When he ventured back to New England he was imprisoned for about a year while evidence for a libel suit was being collected, and was finally let go on payment of a fine of \$500. Nathaniel Hawthorne's 'The Maypole of Merry Mount' (in 'Twice-Told Tales,' 1837) and J. L. Motley's 'Merry Mount' (1849) are based on Morton's career.

Morton, William James, American physician: b. Boston 1845. He is a son of W. T. G. Morton (q.v.), whose name is connected with the first anæsthetic use of ether. He was educated at the Boston Latin School; graduated at Harvard in 1867; and a year later entered the Harvard Medical School. On his graduation there, in 1872, he presented a thesis on "Anæsthetics," which gained him the Boylston prize. For a time he did hospital work; practised medicine at Bar Harbor, Maine, and in Boston; studied in Vienna, 1873-4; went to Kimberley, South Africa, where, besides practising his profession, he engaged in diamond-mining. Settling in New York finally, he became editor of the 'Journal of Nervous and Mental Diseases'; from 1882-5 was adjunct professor of nervous diseases at the New York Post-Graduate Medical School; served as neurologist to the New York Infant Asylum, 1887-90; and since then has been professor of nervous diseases and electrotherapeutics at the New York Post-Graduate School. As an authority in electrotherapeutics he has won wide recognition, and by his mechanical device for establishing the "static induced current" of electricity—the "Morton current" of the scientific world—has supplied a means for producing the X-ray, and rendered a service of great practical value to medicine and surgery. His contributions to medical literature are numerous. He has been president of the New York Neurological Society, of the New York Electrotherapeutic Society, and of the American Electrotherapeutic Association,

and is a member of many American and foreign scientific bodies.

Morton, William Thomas Green, American dental surgeon: b. Charlton, Mass., 19 Aug. 1819; d. New York 15 July 1868. He established himself in the practice of dentistry in Boston, and there in March 1844 became a student of medicine in the office of Dr. C. T. Jackson (q.v.), the scientist. In November 1846 he obtained a patent for the process of anæsthesia by what he called "letheon," now known as ether. Jackson claimed the discovery of etherization previous to the winter of 1841-2, and Morton's patent was contested by both Jackson and Horace Wells, another of Jackson's pupils. Morton communicated his knowledge of the process to Dr. J. C. Warren, and anæsthesia by ether was made public through an operation performed by Warren at the Massachusetts General Hospital 16 Oct. 1846. The French Academy of Sciences investigated the matter and decreed a Montyon prize of 2,500 francs to Jackson for the discovery, and another of like amount to Morton for the application of the discovery to surgical operations. In 1852 a bill appropriating \$100,000 as a national testimonial to Morton was introduced in Congress, but failed, as it did also in 1853 and 1854. Testimonials accrediting to him the application of ether as an anæsthetic were signed by the medical profession in Boston (1856), New York (1858), and Philadelphia (1860). Consult Weyman, 'Trials of a Public Benefactor' (1859).

Mortuary Customs. See BURIAL; DEAD, DISPOSAL OF.

Morwitz, mör'vits, Edward, German-American journalist: b. Dantzic, Prussia, 11 June 1815; d. Philadelphia 13 Dec. 1893. After thorough training in the sciences and medicine at various German universities, he was graduated in 1840 from Berlin University, where he became an assistant physician and wrote 'The History of Medicine' (1848-9). In 1843 he practised his profession at Conitz, Prussia, but after the revolution of 1848, settled in the United States. In 1853 he bought the German 'Democrat' of Philadelphia and in 1855 issued a German political German weekly, 'The United States Journal,' followed in the same year by a German Sunday paper, 'The New World.' In 1862 he took a leading part in establishing the German Press Association of Pennsylvania, and in 1870 organized the movement to raise funds for aiding German soldiers in the Franco-German war, about \$600,000 being received for that purpose. He at one time controlled a large number of newspapers, both German and English, and was a powerful factor in welding together the German population of the State. He invented a breech-loading gun before leaving Germany.

Mosaic, an imitation or reproduction of a painting or ornamental design, formed generally by means of pieces of opaque glass of different colors; also by colored stones (especially marbles and precious stones) placed side by side, and attached by being bedded in a cement. The art originated in the East, but received its perfection from the Greeks, and was thus conveyed to the Romans. In Italy many floors ornamented with mosaic work have been found among ancient ruins. Afterward, when the art was revived in Italy, the Venetian school becoming very

MOSANDRIUM — MOSBY

celebrated, Clement VIII., in the 17th century, had the interior of the dome of Saint Peter's decorated with this kind of work. The art was largely employed for copying paintings by famous artists, and thus rendering permanent their original freshness and beauty. The Roman school of mosaicists is still the most famous, though excellent works have been produced in recent times by Venetian and also by Russian artists. There is a studio for the production of mosaics in the Vatican at Rome. The most important works executed here in recent times are a series of portraits of the popes. In the most costly mosaics precious stones have been cut to furnish materials; but in common works of this art enamels of different colors, manufactured for the purpose, are the material employed. Roman enamels are made of small rods of opaque colored glass. In the first place cakes of glass are made of every variety of color and shade likely to be required. As many as 10,000 shades are said to be in use. These cakes are drawn out into rods thicker or thinner, according as they are to be used for finer or for coarser work, a great number being mere threads. They are kept in bundles, and arranged in sets corresponding to their colors. For a work of moderate size a piece of dark slate or marble is prepared by being hollowed out like a box and filled with plaster of Paris; upon this plaster the artist draws the design or pattern, and the workman proceeds with his work by removing small squares of the plaster, and filling in these with pieces cut from the glass rods, the pieces being fixed in their places by a cement. Gradually, in this manner, all the plaster is removed, and a picture is formed by the ends of the pieces of colored glass. It will easily be understood that this is a very slow process, and there are large pictures that have taken as many as from 12 to 20 years to produce. When mosaic pictures are to be viewed near at hand they are polished perfectly smooth with a flat stone and emery, and present a glossy surface similar to that of paintings in oil. When they are to be viewed at a distance the surface is left rough, when they present an appearance similar to pictures in fresco. Inlaid works, of agate and other costly stones, are executed on the same principle as mosaic, except that the stones are larger, and cut to the shape of different parts of the object to be represented. Works of this class are known as Florentine mosaics. Flowers and ornamental designs are the chief objects of this branch of the art. A mode has been invented of sawing the plate with the mosaic pictures into two or three sheets, and thus increasing the number of works produced at one time.

Mosandrium, or **Mosandrum** (from K. G. Mosander, a Swedish chemist), a supposed metallic element, whose oxid was thought to have been discovered in 1878 by J. L. Smith, in specimens of the mineral samarskite obtained from North Carolina. It is not now recognized as an element, being in all probability a mixture of terbium and other metals of the cerium group.

Mo'sasaurs, a group or family* (*Mosasauri*; *Mosasaurida*) of marine reptiles of the Upper Cretaceous Period, typical of the reptilian subclass *Pythonomorpha*. They were of world-wide distribution and their remains occur so plentifully in the western United States as well as in the Old World that their structure is thoroughly

known. They were large predaceous marine lizards, resembling the modern monitors in many features, but reaching in many species the size of crocodiles—larger in some cases, but no skeletons are known indicating a greater length than 45 feet. They had four limbs with all the bones well developed but enclosed in a mitten of flesh and skin, forming paddles, which, with their great tails must have made them powerful and agile swimmers. "Their cup-and-ball vertebrae indicate great flexibility of the body, their sharp teeth denote ability to capture slippery prey, and the structure of the lower jaw shows that they probably ate in a hurry and swallowed their food entire. . . . In the Mosasaurs, as in the cormorants, among birds, there is a sort of joint in each half of the lower jaw, which permits it to bow outward when open; . . . if the reader will extend his arms at full length, the palms touching, and then bend his elbows outward, he will get a very good idea of the action of a mosasaur's jaw"—Lucas. The mosasaurs were of three types, namely, *Tylosaurina*, resembling gavials, with a long slender beak or extension of the snout beyond the teeth, and long paddles strengthened with numerous phalanges; *Platecarpina*, short-headed, very long-tailed reptiles, including *Platecarpus*, *Prognathosaurus*, *Brachysaurus* and some other genera; and *Mosasaurina*. The last were the typical mosasaurs, apparently the most completely marine and powerful and perfected of the race. The two genera are *Mosasaurus* and *Clidastes*. None survived the close of the Cretaceous. Consult Zittel-Eastman, 'Text-book of Paleontology' (1902), in which will be found detailed and illustrated descriptions of various forms, and many references to the literature of the subject.

Mosaylima, mō-sā-lē'mā, or **Moseilema**, Arab prophet and rival of Mohammed (q.v.): b. early in the latter half of the 6th century; d. 633. He seems to have been a prophet in the tribe of Bani Hanifah, in Nejd, before Mohammed arose; and his name Rahmān, "the merciful," one of Mohammed's favorite titles for Allah, may be held proof that he claimed to be the Messiah. Tradition says that Mohammed scornfully refused Mosaylima's suggestion that they should share the spiritual leadership of the earth; but modern criticism makes it more probable that the Prophet compromised with him considerably, and it is even suggested that Mohammed wished to make him his successor by testament, but was prevented by his attendants as he was dying. A break between Abu Bekr and Mosaylima came speedily; perhaps Mosaylima even openly opposed Islam. At any rate in the 11th year of the Hegira, his forces though far superior in numbers were met and defeated by Khaled, the Sword of God.

Mosby, mōz'bī, **John Singleton**, American lawyer and soldier: b. Edgemont, Powhatan County, Va., 6 Dec. 1833. He was graduated at the University of Virginia (1852), admitted to the bar (1855), and was practising law at Bristol, Va., when the Civil War broke out. He enlisted as private in the Confederate Army and was later promoted adjutant of the 1st Virginia Cavalry. In two months' time, however, he was reduced to the ranks. Mosby, undaunted, then offered his services as scout to Gen. James E. B. Stuart, and in that capacity guided Stuart's cavalry in a desperate raid on McClellan's army on

MOSCHELES — MOSCOW

the Chickahominy in June 1862. In 1863, after enduring a short captivity, he went to Richmond and recruited an independent body of fighters which soon became famous under the name of Mosby's Partisan Rangers. This small cavalry command, of which he was colonel, became a terror to the Union troops and did much damage in cutting off means of communication and destroying supply trains, capturing outposts, etc. They adopted a guerrilla style of warfare and operated through Virginia and Maryland. Subsequently his force was pressed into the regular Confederate army as the 43d battalion of Virginia cavalry, and served till the cessation of hostilities. His men were dispersed and concealed when not engaged in raiding, and he had in force a perfect system of reassembling them at the shortest notice. At Chantilly 16 March 1863 he defeated a much larger force than his own. Probably his most brilliant exploit was the capture of Brig.-Gen. Stoughton, U. S. A., at Fairfax Courthouse, in the same month. To accomplish this he made a raid inside the Federal lines. At Danesville 1 April 1863 he successfully defended himself against a force sent especially to capture him. He harassed the rear of Grant's army, in its advance on Fredericksburg, to such an extent that Grant was forced to send a special detail to protect his communications and supplies. One of Mosby's most important raids resulted in the capture of Sheridan's entire supply train which he surprised near Berryville.

Mosby was commissioned captain in March 1863, major two weeks later and colonel some time after that. His regiment was disbanded 21 April 1865, and he again took up the practice of law, settling at Warrenton Va.

Mosby became a Republican after the War and supported Gen. Grant for the presidency. It is said he originated the phrase "the solid South." He was United States Consul to Hong Kong 1878-85, and afterward practised law in San Francisco, Cal. He delivered a lecture in Boston, on Stuart's Cavalry, in December 1886, which was afterward published in book form and entitled 'War Reminiscences' (1887). He also wrote 'The Dawn of the Real South' (1901). Consult: Crawford, 'Mosby and His Men' (1867); Williamson, 'Mosby's Rangers' (1896).

Moscheles, mōsh'ē-lēs, **Felix**, English artist, son of the composer, Ignaz Moscheles (q.v.): b. London 8 Feb. 1833. He was educated in London and Leipzig; studied painting under van Lerius in Antwerp, and in Paris and New York; exhibited at Antwerp, in the Paris Salon, and at various London galleries; is best known for his portraits of famous people, as those of Mazzini, Gounod, Rubinstein, Robert Browning, and H. M. Stanley; and has also done much genre painting, examples being 'A Spanish Song,' 'Herodias' Daughter,' and 'Little Mozart's Choir.' He edited (1888) 'Felix Mendelssohn's Letters to Ignaz and Charlotte Moscheles' (Mendelssohn was his god-father); and wrote 'In Bohemia with DuMaurier' (1897), and 'Fragments of an Autobiography' (1902).

Moscheles, **Ignaz**, German pianist and composer: b. Prague 30 May 1794; d. Leipzig 10 March 1870. He studied under J. D. Weber, director of the Prague Conservatory of Music, and afterward under that of Albrechtsberger

and Salieri, at Vienna. On the completion of his studies he made a successful professional tour in Germany, and in 1820 arrived at Paris, where he met with an exceptionally enthusiastic reception. In 1821 he went to London where he was professor of music at the Royal Academy for 25 years. Here he had Thalberg for a pupil, as he had formerly, in Berlin, had Mendelssohn. At the latter's request he went from London to Leipzig where he was professor of music in the conservatory there from 1846 till his death. Among his finest compositions may be mentioned his Concertos Nos. 3, 4, and 5, the Concertos Fantastique and Pathétique; his great Sextett and Trio; his Sonatas Caractéristique and Mélancolique; and his studies. Consult: 'Aus Moscheles Leben' (1872); 'Briefwechsel mit Mendelssohn-Bartholdy' (1888).

Moschus, mōsh'kūs, Greek bucolic poet of Syracuse: flourished about 150 B.C. Four idylls form the whole of the remains of Moschus, which exhibit great elegance of style and delicacy of conception. The *Ἐριφάιος Βίανος* ('Lament for Bion') was imitated by Shelley in 'Adonais.' The works of Moschus have commonly been edited with those of Bion (q.v.) and Theocritus (q.v.), and the three have been well translated by Andrew Lang (1880).

Moscoco de Alvarado, Luis, loo-ēs' mōs-kō'sō dā āl-vā-rā'dō, Spanish adventurer: b. Badajoz, Spain, about 1505; d. Peru about 1560. He served under his kinsman Pedro de Alvarado in his expedition to Guatemala in 1519 and in 1534 accompanied him to Peru where he was for two years a follower of Pizarro, and then returned to Spain to live in luxury for several years on the proceeds of his services. In 1538 he attached himself to De Soto's expedition to Florida and upon the latter's death in 1542 took command and after many hardships succeeded in returning to Mexico. He was honored by the viceroy Mendoza and in 1551 accompanied him to Peru where he was entrusted with important commands until his death.

Mos'cow, Idaho, town, county-seat of Latah County; on the Union Pacific and Northern Pacific R.R.'s; about 70 miles, in direct line, southeast of Spokane, Wash. The chief industries of the country around Moscow are lumbering, farming, stock-raising, mining, and fruit-growing. Considerable grain and vegetables are raised. The chief manufactures of the town are lumber, flour, and machine-shop products. The University of Idaho and the State Agricultural College are located in Moscow. Pop. (1900) 2,484.

Moscow, Russia, the second capital of the empire, and until Peter the Great selected Saint Petersburg as a northern capital, the sole capital and imperial residence, situated in a highly cultivated district on the Moskva, 400 miles direct by rail southeast of Saint Petersburg. It is the capital of a government of the same name and is specially esteemed by the Russians as the place of the coronation of the czars, the favorite residence of many of the nobility, the commercial emporium of central Russia and western Asia, and a principal seat of Russian manufactures. It is the holy or white mother city in the creed of the people, and no czar would omit visiting it at least twice a year, or presenting in the city his eldest son after he has reached his majority.

MOSCOW

As a general rule the temperature ranges from a winter mean of 14° F. to a summer mean of 66° , the annual mean being 40° . Moscow is surrounded by a wall or earthen rampart, 26 miles in circuit, of irregular shape, and altogether useless for any purpose of defense. A considerable portion of the enclosed space is unoccupied by buildings, has an undulating surface, and is traversed by the navigable Moskva, which, entering at the middle of the west wall, makes a series of serpentine windings, in the course of which it receives the Iaoussa and the Neglina, and leaves the city at the southeast corner. The general view of the town, as seen from Sparrow Hill, an eminence on the southeast, is peculiarly striking and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously colored domes and spires, its imperial and other palaces, its boulevards, gardens, ponds, and, above all, the high walls and numerous stately towers of the Kremlin or citadel, produce an effect unequalled by any other European city. It formerly comprised five principal divisions: the Kremlin, Kitaigorod, Byeloigorod, Semlyanoigorod, and the Sloboden or suburbs, each part being separated from the other by walls, of which now only those of the first two mentioned districts remain.

Public Buildings, etc.—The Kremlin, situated on the north bank of the river, forms the centre of the town, and in it are found the principal civil and ecclesiastical buildings. Here in the first place is to be seen the Great Palace, a lofty building in a mixed style of architecture, erected in 1838–40, having the Treasury, forming a sort of wing, on the right, while also connected with it is the Terem or old palace of the czars, belonging to the 16th and 17th centuries. The Cathedral Square, on the summit of the Kremlin, contains the Uspenskiy Cathedral (Cathedral of the Assumption), in which the emperors are crowned, built in 1475–9, a clumsy building with heavy pillars, which support five cupolas, these, like the walls, glittering with grotesque frescoes of sacred subjects, painted on a golden ground; another cathedral here is the Archangelskiy Cathedral (of the Archangel Michael), founded in 1333 and rebuilt in 1505–9, containing the tombs of many czars down to Peter the Great; a third is the Blagovieshchenskiy Cathedral (of the Annunciation), founded in 1397. The arsenal is an immense building lining one side of the northern angle of the Kremlin, the opposite side being occupied by the senate. The chief attraction is the upper story of the treasury, containing the crowns of the early czars, several thrones, warlike trophies, and miscellaneous curiosities; the arsenal contains an immense quantity of weapons and arms, the cannon taken from the French during their retreat, and numerous other military trophies. Near the centre of the buildings of the Kremlin is the tower of Ivan the Great, which rises to the height of 300 feet, contains numerous bells, and is surmounted by a gilded dome, on which the cross is displayed above the crescent. The great Czar Kolokol, or king of bells, the largest in the world, stands at the bottom of the tower on a granite pedestal, to which it was raised in 1832, after having remained for a century buried on the spot where it had fallen when the tower in which it was suspended was burned down. The Kremlin also contains a bronze statue of Alexander II. (1898).

Outside of it the chief buildings are the cathedral of St. Vassili (St. Basil), one of the strangest specimens of architecture anywhere to be met with, having no less than 20 gilded and painted domes and towers, all of different shapes and sizes; and the Temple of the Savior, built to commemorate the French retreat, at a cost of \$10,000,000. Other buildings worthy of notice are the great riding school, the Gostinnoi Dvor or principal bazaar in the Kitaigorod, a colossal building of three stories, where the leading wholesale merchants carry on their business; the Riadi, in the same quarter, now occupied by handsome new shops. Among the principal educational establishments is the imperial university, founded in 1755 by the Empress Catharine; it consists of four faculties, is attended by over 4,000 students, and has a library of about 220,000 volumes, an observatory, and botanic garden; there are many gymnasia of various kinds and grades; technological, agricultural, oriental, commercial, military, and other schools. There are several good museums, the chief being the Ruminantsof, or public museum, in a fine building, with library and reading-room. The foundling hospital, in which children are received without questions being asked, supports about 5,000 children within its walls, besides large numbers outside. The number of the open and planted spaces throughout the city is great, but otherwise the streets are narrow, uneven, and crooked, lined by mean-looking brick and wood houses. Beside the imperial palaces in the Kremlin are the Petrofskoi palace and gardens outside of the Saint Petersburg gate, the principal fashionable resort during the summer season, and the palace of the Empress Elizabeth; and among the favorite pleasure grounds are the beautiful gardens of the Kremlin and the Galitzin garden on Sparrow Hill. Moscow is the residence of two archbishops, and of the governor-general of the province.

Manufactures, Commerce, Communications.—Moscow is the first manufacturing city in the empire, and of late years its industrial and commercial activity has greatly increased. The manufacturing establishments give employment to more than 125,000 workmen, and annually turn out goods to the value of about \$150,000,000. The principal establishments are for textile fabrics, chiefly cotton, woolen, and silk, besides manufactures of metals, railway trucks, looms, fibrine, paper, leather, and other articles. The machinery employed in the factories is generally of the most improved description, and though partly made in the city largely comes from Britain and elsewhere. From its central position Moscow is the great entrepôt for the internal commerce of the empire. Great facilities for this commerce are given by water communication, which extends on one side to the Baltic, on another to the Caspian, and on a third to the Black Sea; and by the railways to Saint Petersburg, Yaroslav, Nijninogorod, etc. In winter the traffic over the snow in sledges is enormous. Tea, silk, indigo, and cotton are important articles of trade.

Administration, etc.—Moscow is under the immediate charge of a general governor and a military governor. It is the seat of important civil and criminal courts, and of various superintending boards of police, manufactures, trade, etc.; and has a number of literary, scientific,

MOSEILIMA — MOSES

and other societies of different kinds. Pop. (1891) 822,397; (1897) 977,269, with suburbs 1,035,664, nearly all Great Russians of the Orthodox Greek Church.

History.—Moscow is said to have been founded in 1147 by George Dolgomki, prince of Kiev. Its nucleus was the Kremlin, which at first was nearly surrounded by a palisade, and formed an important military station. For a long time it continued to be a dependency of the principality of Vladimir; and in 1238, when Batou-Khan devastated Russia, it was sacked and burned. In 1293 it was again sacked, and the inhabitants were dragged away into slavery by Khan Nagai. Ivan Danilovitch of Vladimir took the title of grand prince of Moscow in the early part of the 14th century, and from that time it remained the seat of government until the beginning of the 18th, when the administration was transferred by Peter the Great to Saint Petersburg. Moscow was plundered by the Lithuanians and the Tartars of Tamerlane in the latter part of the 14th century, and was nearly consumed by fire in 1536, in 1547, and again in 1571, when the Tartars set fire to the suburbs, a large part of the population perishing on that occasion. During the insurrections caused by the pseudo-Demetrius (1605-12), when the Poles and Cossacks took the city, it was again partly destroyed. In 1812 it was entered by the French under Murat on 14 September, and on the 15th by Napoleon, who took up his residence in the Terem palace in the Kremlin. The city, deserted by its inhabitants, was set on fire by order of the governor, Count Rostopshin, compelling Napoleon to leave on 19 October, and to take his final departure on the 23d, and resulting in the disastrous retreat of the French army. The greater part of the city was then destroyed, notwithstanding the efforts of the French to stay the progress of the flames. It was rebuilt within a few years. The railway to Saint Petersburg was opened in 1851. The chief of modern events are the coronations in 1856 of Alexander II., and in 1896 of Nicholas II., at the latter ceremony 2,000 people being crushed to death, and hundreds injured, during the distribution of gifts.

Moseilima. See MOSAYLIMA.

Moseley, mōz'li, Edward Augustus, American lawyer: b. Newburyport, Mass., 23 March 1846. He went to sea when a boy, and was engaged for several years in both the East and West Indian trade. He then studied law, was admitted to the Massachusetts bar, practised as a lawyer, and was also a member of the State legislature for several terms. His chief interest has been the lessening of danger in railroad travel; he has become the leading authority in the United States on all measures or appliances for procuring the safety of railroad employees and travelers, and largely for this reason was appointed secretary of the Interstate Commerce Commission at the time of its formation. On account of his constant efforts in obtaining and enforcing the safety-appliance law he has received numerous testimonials from all the railroad men's organizations in the United States, and the formal thanks of the Commonwealth of Massachusetts "for distinguished services in the cause of humanity." He has written 'Arbitration as Applied to Railways and their Employees'; 'Safety Appliances on Railroads';

'One Hundred Years of Interstate Commerce Law' (1900); 'The Transportation Question as Affected by the Cullom Bill' (1900).

Moselle, mō-zél (German, *Mosel*), a European river which rises in France on the south-east of Remiremont, in the department of the Vosges, across which it flows northwest, through the department of Meurthe-et-Moselle. Thence it proceeds northeast through German Lorraine into Rhenish Prussia. After passing Trèves in a remarkably winding course, it falls into the Rhine at Coblenz; total course, about 360 miles, of which 220, commencing at the junction of the Meurthe, are navigable. Its principal affluents are, in France, on the right bank, the Valogne, Meurthe, which joins it below Nancy, and Seille, which it receives at Metz; on the left bank, the Madon, Math, Orne; and beyond France, on the right bank, the Sarre, which joins it above Trèves; and on the left bank, the Sure, Kill and Elz. Of these affluents the Meurthe, Sure, and Sarre are navigable.

Mosenthal, mō'zēn-tāl, Joseph, German-American musician: b. Cassel, Germany, 30 Nov. 1834; d. New York 6 Jan. 1896. He studied music in Germany and in 1853 removed to the United States where he was organist and choir director of Calvary Church, New York, 1860-87. He conducted the famous Mendelssohn Glee Club in New York in 1867-96 and played the violin in several leading orchestras there. He composed both church and secular music, among which are the psalm 'The Earth is the Lord's' and part songs for 'Thanatopsis,' 'Music of the Sea,' etc.

Mosenthal, Salomon Hermann von, German dramatist: b. Cassel 14 Jan. 1821; d. Vienna 18 Feb. 1877. He studied at the University of Marburg and in 1851 obtained a position under the Austrian government. His best-known dramas are 'Deborah' (1850); the original of 'Leah the Forsaken,' and 'Sonnenwendhof' (1857), which have been translated into English, Danish, Hungarian, and Italian. He wrote also 'The German Actors' (1863); 'The Mayor of Altenburen' (1868); 'Maryna' (1871); the tragedies 'Düweke' (1860); 'Pietra' (1865); etc.

Moser, mō'zēr, Gustav von, German dramatist: b. Spandau, Prussia, 11 May 1825. He obtained a military education and after serving in the Prussian army resigned in 1856 to devote himself to literature. He has produced more than 40 successful comedies, several of which have also been well received in English translations. Among his plays may be named 'Das Stiftungsfest' (1873); 'Ultimo' (1873); 'Der Bibliothekar' (The Private Secretary) (1878); 'Der Veilchenfresser' (1876); 'Krieg im Frieden' (1880). The uniform edition of Moser's plays begun in 1873 included over 20 volumes.

Moses, mō'zēz, the prophet, teacher and legislator of the Hebrew race. His life may be divided into three equal portions of 40 years each, which include his training in Egypt, his exile in Arabia and his government of the Israelite nation in the wilderness.

Moses was born 1738 B.C. at Heliopolis, while his nation was sunk in the deepest depression of servitude. His beauty as a babe was noted by the Egyptians and the story of his being con-

MOSES

signed to the Nile in a basket of papyrus is well known.

The first period of the life of Moses must be considered to comprise his education in all the wisdom of the Egyptians. He grew up at Heliopolis where he learned the whole range of Greek, Chaldaic and Assyrian literature. From the Egyptians he learned mathematics. He taught grammar to the Jews and was in every way a learned man of his age.

Moses became, however, the object of envy and hatred by those who were about him. His spirit was rash and the servile and treacherous temper of his own compatriots was against him. He fled into Midian 1668 B.C. There it was that he met with Jethro, whose daughter Zipporah he married. It was in the seclusion and simplicity of his life with Jethro's daughter that Moses received his call as a prophet. This took place in the valley of Shoeib or Hobab on which now stands the convent of St. Catherine whose altar is said to be on the site of the Burning Bush. This bush became the symbol of the Divine Presence. The rocky plateau on which it appeared became at once holy. The call was twofold, revealing first of all the Divine Name and secondly giving the mission to Moses.

Moses returned to Egypt from his exile 1658 B.C. Passing over his experiences in private life his public career may be said to commence when he started forth as the deliverer of the children of Israel from the bondage of Egypt.

The most important function of Moses was that which he exercised as a lawgiver of the Israelites. The Israelites were destined as the people of Promise to enter into the land of Canaan. Moses victoriously repulsed the attack of the Amalekites, marched to Mount Sinai where he signally punished the defection of his people, and gave them the law as a testimony of Divine justice and mercy. It was important that a man like Moses should have been at the head of Israel during the vicissitudes of the wilderness and the approach to the Promised Land. Moses made excellent preparations for the conquest and distribution of Palestine and concluded his life of public service by the deliverance of valuable admonitions, while at the same time he transferred his position to Joshua, no unworthy successor.

The death of Moses has always been involved in mystery. In the book of Deuteronomy is described his last long farewell to his people. His death took place in the palm groves of Abila. His age was 120 years, and he is said to have died with unabated vigor.

The great object of his legislation is to inculcate the doctrine that Jehovah is the only God, who will allow no other god beside himself, nor any visible image of his being; that he is himself the king of his people, and that he will rule them by his priests. Hence the laws by which Moses regulates the worship of the Hebrews, the administration of the government and of justice, and even directs their manners, and lays down rules for the care of their health, bear the marks of their heavenly origin. Arising from the wants of the moral and physical nature of man, they were excellently adapted to the peculiar character of the people, to the climate, and to the political position of the land appointed for their dwelling, and to the plan of Providence of making this people a depository of a divine revelation to be developed in the fulness

of time, and finally extended over the world. These laws forbid intermixture with other nations, the introduction of foreign customs, and the adoration of strange deities. As a people peculiarly dedicated to God, the Hebrews were to be separated from all neighboring nations, and to stand separate and independent, relying upon God as their Lord and Master. Regulations extending to the minutest particulars of the daily occurrences of life, in which even the selection and preparation of their food and the care of personal cleanliness were not forgotten, gave them habits adapted to their character and religious destination. A ritual composed of a thousand minute ceremonies, and as a whole allegorically designating a covenant with God, to be incessantly renewed by offerings, prayer, and purification, imposed on them the duty of continual diligence in the service of their heavenly King. To the race of Levi, to which Moses belonged, he assigned the care of the religious service and of seeing that the laws were obeyed, investing, not his sons (whom he allowed to take their place among the common Levites), but the descendants of his brother Aaron, as God commanded, with the first office in the kingdom, that of high-priest. To this tribe, excluded from all property in land, the other tribes were to pay tithes. They were subjected to the authority of elders and judges, and the firmness of their political union was secured by certain festivals to be celebrated by them in common, and by exclusive devotion to the service of God in the tabernacle, a movable temple regarded with awe as the appointed dwelling of Jehovah, into the interior of which the priests alone were allowed to enter, and where, moreover, all the taxes were deposited, so that it was the central point of all the riches of the nation.

These are the chief points in the legislation of Moses, which, even if it displays some Egyptian features, yet plainly manifests the endeavor to wean the Hebrews from Egyptian customs and prejudices, and to elevate them to political and religious independence, and far surpasses, in originality and elevation of principle, in consistency and expressiveness, and, what most proves its heavenly origin, in proofs of true humanity, the boasted legislation of Solon and Lycurgus. Yet its importance was not at once recognized by the Hebrews.

When they were already near the end of their journey toward Canaan, Moses saw himself compelled, in consequence of new evidences of discontent, to lead them back into the desert, and 40 years of toilsome wandering must be passed there: the severe punishments which the law threatens against transgressors must be executed in all their rigor: all those who had attained to man's estate at their departure from Egypt must die before the law could be thoroughly known and become habitual with those who had been born during the wandering. Moses himself, distressed with cares, troubles, and occupations of all kinds, was not permitted to live to see the complete accomplishment of his plan on account of a murmur which, in the midst of his distresses, he allowed to escape against his God. After he had appointed Joshua to be the leader of the Hebrews, and had taken a solemn farewell of the people, he ascended a mountain beyond Jordan, from which he surveyed the land of promise, which he could not enter, and closed his eventful life in his 120th year.

MOSES — MOSQUERA Y ARBOLEDA

All superstitious reverence for his bones or his place of sepulture was prevented by the secrecy of his burial, and its effectual concealment from the people. For an account of the attitude of modern criticism toward the life and work of Moses consult such articles as those on Moses and Israel in the 'Encyclopedia Biblica' (Vols. II.-III.), and histories of Israel by Wellhausen, Renan, etc. On the so-called books of Moses see PENTATEUCH.

Moses, Bernard, American historian and political economist: b. Burlington, Conn., 27 Aug. 1846. After graduating from the University of Michigan in 1870, he went to Europe for further study, receiving his Ph.D. from Heidelberg in 1873. In 1875 he became professor of history at Albion College, but since 1876 has been professor of history and political economy at the University of California. His more important works are: 'Politics' (with W. W. Crane); 'Federal Government in Switzerland'; 'Democracy and Social Growth in America'; 'Establishment of Spanish Rule in America.' He was appointed in March 1900 a member of the United States Philippine Commission.

Moses, Franklin J., American jurist: b. Charleston, S. C., 13 Aug. 1804; d. Columbia, S. C., 6 March 1877. He was graduated from the South Carolina College in 1823, studied law and began the practice of law at Sumter. In 1841 he was elected to the State Senate and re-elected for 30 years. In 1866 he was elected circuit judge and after the reconstruction period chief justice of the supreme court of the State, being re-elected in 1872 and holding the office at the time of his death.

Moses, Raphael J., American lawyer and politician: b. Charleston, S. C., 20 Jan. 1812; d. Brussels, Belgium, 13 Oct. 1893. He first engaged in business and then having acquired a knowledge of law in 1837, practised in Apalachicola, taking an active part in politics. He removed to Columbus, Ga., in 1849 and at once became influential in politics. When the Civil War broke out, he and three sons enlisted in the Confederate forces. In 1864, after serving on the staff of Generals Toombs and Longstreet, he was made civil commissioner of Georgia, with rank of major. After the war he resumed his law practice and in 1866 was elected to the State legislature.

Mosheim, Johann Lorenz von, yō'hān lō'rēnts fōn mōs'hīm, German Protestant theologian: b. Lübeck 9 Oct. 1694; d. Göttingen 9 Sept. 1755. He studied and taught at Kiel; became professor of theology at Helmstedt in 1723, abbot of Marienthal in 1726, and professor (1747) and university chancellor (1755) at Göttingen; was a notable preacher, theologian and church historian; and wrote 'Institutiones Historiæ ecclesiasticæ' (1755, translated into English by Maclaine); 'Institutiones Historiæ Christianæ' (1763); 'Attempt at an Impartial and Thorough History of Heresies' (1748-50); 'Morals of the Holy Writ' (1770-8); etc.

Mosher, mō'zhēr, Eliza Maria, American physician: b. Cayuga County, N. Y., 1846. She was graduated from the University of Michigan in 1875, and studied at the School of Medicine in Paris from 1879-80. She was resident physician at the Massachusetts Reformatory for Women in 1887-9, and director of the institution

in 1881-3. In 1884 she went to Vassar College as professor of physiology and resident physician; from 1886-96, she was engaged in general medical practice in Brooklyn, N. Y., and then became professor of hygiene in the Department of Literature, Science and Arts, and women's dean at the University of Michigan, holding this position till 1902, when she returned to her practice in Brooklyn. She has been lecturer at the Chautauqua Summer School of Physical Education since 1888.

Moskva, mōsk-vā', Russia, an affluent of the Oka a tributary of the Volga, which rises in a marsh in the east of Smolensk, flows east to the city of Moscow, and thence 112 miles southeast to the Oka, which it joins near Kolomna after a total course of 305 miles. It is connected with the Volga by the Moskva Canal. It is navigable from its mouth to Moscow except between November and April when it is frozen.

Mos'lem, or Muslim. See MOHAMMEDANISM.

Mosler, mōz'ler, Henry, American artist: b. New York 6 June 1841. A diligent student of wood-engraving he was draughtsman on a Cincinnati comic weekly (1855), studied with James H. Beard (1859-61), and was art correspondent for 'Harper's Weekly' with the army of the West 1862-3. Realizing the need of study he followed art at Düsseldorf and Paris (1863-6), returning to Europe in 1874. He has resided in Paris since 1877, and has been a successful exhibitor and prize winner at many exhibitions at home and abroad. His specialties are portraits, figure paintings, and groups of figures.

Mosque, mōsk (Arabic *mesjid*, Italian *moschea*), a Mohammedan house of prayer, in the Moresque or Saracenic style of architecture. The mosques of the Arabs often include, in a quadrangular area, an immense quantity of columns ranged in files, the multiplicity and extent of which impress the mind of the beholder with surprise and admiration. These columns are, in numerous instances, the rich spoils of antique monuments. Every province of Turkey has its own particular style and taste with regard to these religious structures, as the Moresque architecture possesses no fixed rules, deeming lightness and elegance alone to be the fundamental laws of architecture. In these Mohammedan churches we find neither altars, nor paintings, nor images, but a great quantity of lamps, of various kinds, which form the principal interior ornament, and some sentences from the Koran written on the white walls. The buildings are often quadrangular in plan, and have an open interior court, where are fountains for ablutions. The floor is generally covered with carpets, but there are no seats. The Mohammedan on entering a mosque must take off his shoes. The finest of the mosques in Constantinople and in the world is that of Saint Sophia. The imperial mosques have frequently public schools, hospitals, and also kitchens for cooking food for the poor.

Mosquera y Arboleda, mōs-kā'rā ē ār-bō-lā'dā, Tomás Cipriano d., Colombian politician and president: b. Popayan 20 Sept. 1798; d. Coconuco 7 Oct. 1878. After three years of service in the patriot army he was captured by the Spaniards, when he was only 18, but he

MOSQUITIA—MOSQUITO

escaped at Jamaica, returned to the army, and in 1829 was made general by Bolivar, who made him also envoy to Peru. After Bolivar's death Mosquera traveled in North America and Europe. He became a senator in 1833; was president of New Granada 1845-9; in 1859 led the federalist revolt against Ospina, adopted a federal constitution by which the name of the country was changed from New Granada to the United States of Colombia, and became dictator of the new federation. His power was checked by a revolt led by Canal, with whom Mosquera in 1862 came to terms. Under the constitution then adopted Mosquera was elected president in 1863 and in 1866; the latter term was cut short by a successful revolution due to the president's arbitrary use of power. He was banished to Lima for two years, but upon his return again entered politics, was governor of Cauca, and became a member of Congress. He wrote on the geography of New Granada, and a valuable life of Bolivar (1853).

Mosquitia, mōs-kē-tē'a. See **Mosquito** COAST.

Mosquito, a name, the diminutive of the Spanish *mosca*, a fly, applied to insects of the dipterous family *Culicidae*. Typical mosquitoes have the following characteristics: The mouth is provided with a prolonged, suctorial, piercing proboscis; the greater part of the body and head and portions of the wings and legs are covered with scales which determine the color pattern; the complicated venation of the wings is also highly characteristic. These features distinguish mosquitoes from the related midges (*Chironomidae* and *Ceratomyidae*) and the black flies (*Simuliidae*) with which they are popularly confused; and from the crane-flies (*Tipulidae*) which inspire most of the newspaper stories of gigantic mosquitoes. Not less than 22 genera and 350 species are now known, and activity in their collection and study is bringing many new ones to light. The species are based largely upon differences in the form and arrangement of the scales and the resulting coloration, the form of the foot-claws, etc. Mosquitoes are cosmopolitan, only a few oceanic islands, deserts and mountain tops being free from them. Frequently they occur in vast swarms, and they abound equally in arctic regions, as Alaska and Greenland, and in the tropical swamps of Africa and South America, while at many intermediate points they are intolerable pests. Vertically they range from the seashore to altitudes of at least 13,000 feet. While many species are local, others are very widely distributed.

Development.—The typical life-history of a mosquito is as follows: The eggs are deposited at night in or rarely near shallow water, which is usually fresh but in the case of a few species may be brackish or salt. After one or a few days they hatch into legless, aquatic larvæ, known from their activity as wrigglers. These have the mouth provided with small jaws for browsing at the bottom, and with brushes of hairs whose movements induce currents in the water and bring to the mouth floating particles or minute plants and animals to serve as food. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous fan of spreading hairs. On the dorsum of the eighth segment is a pair

of spiracles, or breathing-pores, usually borne at the end of an elongated tube or siphon. By their active wriggling the larvæ come frequently to the surface to breathe, and then sink by gravity quietly to the bottom. After one or several weeks the larvæ molt finally and transform into pupæ, which have the head and thorax closely united, and the latter greatly enlarged, with the form of the future legs and wings apparent. At the tail end is a pair of fin-like expansions; while the respiratory organs, instead of being near the end of the abdomen, have the form of a pair of large mouthed tubes or funnels on the dorsum of the thorax. Like the larvæ the pupæ are active wrigglers, but, unlike them, are buoyant and naturally float at the surface with the respiratory funnels uppermost and exposed. When alarmed they display much activity and wriggle violently toward the bottom. The imagoes escape from the pupal investments at the surface, and windrows of cast-off skins are thrown up at the water's edge. The males, which transform first, hover in little clouds and are sought by the females. In the males the antennæ are broad and feather-like, in the females slender and simply hairy. The duration of the period of aquatic life varies with the species and temperature; in our common *Culex pungens* it may be only 10 days, so that many generations may be produced during a favorable season. The winter may be passed in any stage from egg to adult, all of which are extremely resistant to cold, and the aquatic stages capable of withstanding repeated freezing and thawing. The hibernating imagoes, which are found in houses and other sheltered places, may become active on warm days and in the case of *Anopheles*, at least, are chiefly fertilized females.

Food and Enemies.—Notwithstanding that the chief human interest in mosquitoes arises from their blood-sucking habits, yet the taste for blood is certainly an acquired one and a relatively unimportant factor in the lives of the majority of mosquitoes. The normal food of both sexes of many species, and the only food of the males of nearly all, consists of the juices of flowers, fruits, and other plant parts. In a few species a meal of blood by the female seems requisite to the maturation of the eggs, but this is decidedly exceptional. Most of the species are active chiefly at night, but a few, like *Stegomyia fasciata*, in which also both sexes bite, are most vicious during the early afternoon. The bites of all species are not equally irritating, probably the result of dissimilar qualities of the salivary secretion which is poured into the wound to facilitate the blood flow. Ammonia and glycerine allay the irritation. Besides the warm-blooded birds and mammals, mosquitoes attack fishes, frogs, turtles, and even other insects. In turn they have many natural enemies. The aquatic stages are preyed upon by carnivorous fishes, water-newts, larvæ of dragon-flies and aquatic beetles, and leeches. Vast numbers of the flying insects are destroyed by night-hawks and bats, and during the day they are pounced upon by dragon-flies, hornets, and other carnivorous insects, and snapped up by swallows and swifts as they skim the grassy meadows. Of their parasites the recently discovered worm, *Agamomermis culicis*, is considered to exert an important checking influence in some years.

Contrary to the common belief, mosquitoes are weak fliers and usually seek shelter when the

MOSQUITO

wind blows, so that railroad trains, ships and wagons are far more effective than their own wings in their dissemination.

Kinds and Characteristics.—Within the limits of North America nine genera and upward of 30 species are known to occur. Of these only certain species of *Culex*, *Anopheles* and *Stegomyia* are important. The following table exhibits some characteristics of each genus in all stages:

EGGS.

Culex.—Laid in floating boat-shaped masses $\frac{1}{8}$ to $\frac{1}{2}$ inch long, and containing 200 to 400 conical eggs glued together in one layer, with the large ends downward.

Stegomyia.—Laid singly, short, elliptical, with a coating of air-cells.

Anopheles.—Laid singly, but floating in irregular groups, each egg long elliptical, dark colored, with a sculptured surface and an incomplete wrinkled equatorial girdle of air-cells.

LARVA.

Culex.—Head and thorax very broad; hairs in tufts, simple; respiratory tube much elongated; colors generally pale; hang obliquely from the surface of the water; very active.

Stegomyia.—Generally similar to *Culex*, but head, thorax and eyes much smaller, and respiratory tube much shorter.

Anopheles.—Hairs in tufts, generally branched and especially long on sides of thorax and anterior segments of abdomen; last abdominal segment with long plume-like hairs; no respiratory tube; colors dark; rest nearly prone at surface of water; relatively sluggish.

PUPA.

Culex.—Respiratory trumpets relatively slender and compressed, with long very oblique slit-like openings.

Stegomyia.—Respiratory trumpets, conical, moderately compressed, with very short stalks and short only slightly oblique orifices.

Anopheles.—Respiratory trumpets with long slender stalks and very broad truncate funnel-shaped ends, not at all compressed nor oblique.

IMAGO.

Culex.—Palpi of female short, of male nearly as long as proboscis but not club-shaped; when resting, the abdomen is bent at an angle with thorax and head, and nearly parallel to the surface of support (wings unspotted in our species).

FIG. 1.—Resting attitude of female *Culex* with the palpus enlarged.

Stegomyia.—Like *Culex*, but scales of head broad and flat, body generally stouter, and the abdomen and legs black-and-white banded.

Anopheles.—Palpi of both sexes about as long as proboscis, club-shaped in the male; in resting attitude all parts, including proboscis, in line, tip of abdomen directed away from surface of support; wings generally spotted.

Until within about a decade mosquitoes were regarded merely as intensely annoying pests, but

since the definite discovery of their relation to disease-transmission their economic importance can scarcely be overestimated. Besides several diseases of the lower animals three serious human maladies—malaria, yellow fever and elephantiasis—have been definitely traced to their agency, and they are suspected of others.

Mosquitoes and Malaria.—Malaria is one of the greatest scourges to which man is subject. Its cause is fully established to be a minute unicellular animal parasite or haemosporidium of the class *Sporozoa* (q.v.), living within the red blood-corpuscles and introduced by the bite of a mosquito. Each well-marked variety of malaria has its especial causal parasite, which passes through a complicated life-cycle, the principal features of which, as exhibited by *Laverania malaria*, the parasite of pernicious or tropical malaria, are shown in Fig. 2. The parasites

FIG. 2.—Diagrams of the life-cycle of *Laverania malaria*. The stages above the dotted line occur in human blood, those below, in the mosquito.

enter the blood as minute slender sporozoites (XIX), penetrate red blood-corpuscles, and become ameboid trophozoites (I-V) which feed on the substance of the corpuscles and gradually destroy them, at the same time depositing granules of pigment or melanin. With the completion of their growth the amebulae undergo segmentation or schizogony, each dividing into a mass of nucleated bodies (6 to 10) which escape into the blood-plasma by the disintegration of the red corpuscle. The free bodies, or merozoites, seek and penetrate fresh corpuscles, whereupon the cycle begins anew, simultaneously with a paroxysm of fever. Most of the parasites continue this process repeatedly, but for some unknown reason a few assume a crescentic form (VI) and escape from the corpuscle without division. As long as the crescent-shaped bodies remain within the warm-blooded host they undergo no further material change, but if they are in any way removed, as into the stomach of a mosquito, they enter upon a second series of changes. First they become spherical, in which condition some (female gametes, Xb) remain, others (male gametes, Xa) produce filiform bodies. This is the sexual generation, the utility of which is fulfilled when a single male gamete unites with a single female gamete (XI) to produce a zygote (XII), comparable to the fertilized ovum of a higher animal. If this union

MOSQUITO

takes place in the stomach of an *Anopheles*, but so far as now known under no other condition for the human malarial organism, the zygote becomes amoeboid (XIII) and travels to and penetrates the wall of the stomach, beneath the muscular layer of which it rapidly grows to about six times the diameter of the zygote and forms a spherical cyst projecting from the stomach-wall into the body-cavity. In the meantime the contents of the cyst subdivide into numerous nucleated bodies (XIV-XVII), each of which finally becomes a sporozoite like those with which the infection began. When mature the sporozoites are freed into the body-cavity by the rupture of the wall of the sporocyst, when they migrate to the salivary glands, penetrate their walls, and reach the proboscis through the salivary duct. When a mosquito harboring the parasites in this stage bites a susceptible human being, some of the spores pass into the blood with the saliva and induce an attack of malaria, mild or severe according to their number and other conditions. Thus it will be seen that the malarial organism once introduced into the human system may continue to multiply indefinitely by the asexual method unless destroyed by drugs or some reaction of the organism, but that it can be transferred naturally to another person only through the intermediation of a mosquito and the intervention of the sexual generation. Properly speaking, man is the intermediate, the mosquito the final or definitive host, though the latter appears to suffer no ill consequences from the presence of the parasite. In pernicious tropical malaria, or aestivo-autumnal fever, the period for the complete development of sporozoites in the mosquito is seven or eight days, but owing to the vast number of parasites of different broods present in the blood and their overlapping stages of development the exact time of schizogony is doubtful. Tertian and quartan fevers, the two best differentiated types of mild or benignant malarial fevers, are caused by related parasites known respectively as *Plasmodium vivax* and *P. malaria*, which differ from *Laverania* chiefly in the replacement of the crescent stage by an immediately spherical gametocyte. Asexual sporulation recurs in the first form at intervals of 48, and in the latter of 72 hours, corresponding with rhythm of the fever's paroxysms. Daily or other intermediate recurrences are due to double or triple infections, in which the different broods sporulate on alternate days or in other combinations.

Although not a few keen observers in many countries and for many years have more or less vaguely noticed a relation between mosquitoes and malarial infection, the definite statement of the nature of this relation and its scientific demonstration are very recent. In 1880 Laveran, a surgeon in the French army, discovered the amoebulae in the blood of malarial patients in Algiers; the development of the sexual generation in the mosquito, and its relation to Laveran's parasite, were traced by Ross in 1897-8, while to the Italian zoologist Grassi is due the first clear demonstration of the effectiveness of preventive measures directed at the mosquito. Our scientific knowledge of the subject has been almost entirely created within the five years subsequent to 1898, and workers in many countries are constantly adding details. That several species of *Anopheles*, and especially *A. maculipennis*, are the chief, and so far as known the sole

disseminators of all types of malarial fever, is absolutely and thoroughly demonstrated from every standpoint. Many attempts to infect *Culex* with the human malarial parasites have failed, the gametocytes, as well as all other stages, being digested in the mosquito's stomach, although species of this genus are the normal hosts of the hæmosporidia which cause malarial affections in birds and other lower animals. Practically every fact known concerning the etiology of malaria adds to the evidence for the mosquito-malarial relation, and not a single one is definitely opposed to it. Still there remain some obscure points, especially in the relation of the different types of the disease to their specific parasites and of these to specific mosquito-hosts.

Mosquitoes and Yellow Fever.—In the case of yellow fever our knowledge is in a very different and less satisfactory state. The relation of mosquitoes to this disease was suspected by Dr. Finley as early as 1881, but his theory excited little interest until, upon the occupation of Cuba by the American navy, a Yellow Fever Commission of inquiry, headed by Major Reed, was appointed. By a series of very careful experiments it has been established that mosquitoes are agents in the dispersal of this disease, and at the same time the old view of infection by contact and the old practice of isolation and fumigation for prevention have been nearly repudiated. Indeed, the success of these experiments had a most melancholy demonstration in the death of Dr. Lazear, a member of the Commission and a martyr to the cause of scientific investigation. The particular species of mosquito which transmits yellow fever is *Stegomyia fasciata*, an especially fierce biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia. All efforts to determine the pathogenic organism of yellow fever have hitherto failed, chiefly owing to its minuteness, which is so extreme that the blood of a yellow fever patient loses none of its infectiousness by passing through a Pasteur filter. Claims have been made for several species of bacteria, especially the *Bacillus icteroides* of Sanarelli, but have been combated by the American commissioners. The period of incubation required within the mosquito points to a sporozoan.

Agency in Other Diseases.—Elephantiasis or filariasis, like malaria, results from the presence in the blood of an animal parasite, but one of a very different nature. The adult males and females of the *Filaria*, which is a slender nematode worm, live together in the subcutaneous lymph vessels, and produce enormous numbers of living, minute embryos which swarm in the blood, usually passing into the superficial capillaries at night, and retreating to the deeper vessels by day. This peculiarity first led Manson to suspect the mosquito as a means of distribution, and as a result of his studies and those of Bancroft and others on the *Filaria* of man and the dog, it is now known that when infected blood is swallowed by *Culex fatigans* and other mosquitoes the embryos pass through certain stages of development within the intestine and malpighian tubules, and then migrate through the body-cavity and tissues to the proboscis, from which human infection occurs. About three weeks are required to complete the development within the mosquito, and a year before the

MOSQUITO BEE — MOSS

worms become sexually mature in the final host. Elephantiasis is a dreadful and prevalent disease in tropical countries, and is frequent in the Southern States, but rare in temperate climates.

The mosquito is suspected of being instrumental, with other blood-sucking insects, in the spread of other parasitic and bacterial diseases, and undoubtedly many important discoveries await the careful and energetic investigator in this field.

Restraining Local Pests of Mosquitoes.—The possibility of the control or complete extermination of mosquitoes is now receiving very serious attention from zoologists, physicians, and sanitary engineers, and is encouraged by local and national governmental grants. Wherever the problems have been carefully considered, as in New Jersey, Long Island, and Winchester, Va., in this country, much has been already accomplished toward the mitigation of the pest, and a very hopeful feeling of complete success exists. As to measures, the complete destruction of all breeding places by the draining of swamps, pools and ditches is the most effective and permanent. This must be supplemented by emptying or suitably protecting by screening against the access of gravid mosquitoes all artificial vessels, such as pails, rain barrels, cisterns, privies, and drains, which contain standing water in which mosquitoes may breed. A most effective and simple measure for local application is to pour a small quantity of kerosene upon the surface of the water of breeding places. This spreads as a delicate film which deters the larvæ and pupæ from coming to the surface to breathe, so that they quickly suffocate, and at the same time kills or drives off females which come to lay their eggs. The application should be repeated at intervals of two or three weeks. Small fishes and the other natural enemies named above may be introduced into breeding places to good purpose; and it has been found that duckweed and other plants which cover the surface of the water in a close mat render pools unsuitable for breeding purposes. The usual methods of ridding houses of mosquitoes by fumigation, of preventing their entrance by thorough screening, and of protecting the person by the application to the skin of oil of citronella and other substances have of course their value; and it has been shown by the experiments of Grassi and others that this method alone is sufficient to grant immunity from malaria to inhabitants even of such fever-scourged districts as the Campagna of Rome. For the medical treatment of malaria we have a powerful specific in quinine, which is most effective at the time of the paroxysms, when the sporulæ are free in the blood-plasma and most susceptible to the action of the drug.

Bibliography.—As an introduction to the already extensive literature of the subject the following should be consulted: Theobald, 'Monograph of Culicidæ' (London, 1901); Howard, 'Mosquitoes' (New York, 1901); Smith, Johnson and others, 'Reports' of the New Jersey Agricultural Experiment Station (1900 —); King, 'Mosquitoes and Malaria,' Popular Science Monthly, 1883; Grassi, 'Die Malaria' (1901); Lankester, 'Treatise on Zoology,' Pt. I. (London, 1903); Nuttall, 'Insects and Disease,' Johns Hopkins Hospital Reports VIII., Nos. 1 and 2, 1899; Bancroft, 'Filaria,' Jour. Royal Society N. S. Wales (1901); and Publications of

the U. S. Department of Agriculture and Marine Hospital Service. JOHN PERCY MOORE, *Instructor in Zoology, University of Pennsylvania.*

Mosquito Bee, one of the small, gregarious, stingless honey-bees of the genera *Trigona* and *Melipona*, which make very large combs of bitterish honey in the tropical forests. Ordinarily they place these deposits in hollow trees, but sometimes suspend them from branches, protected from enemies in various ways.

Mosquito Blight, a disease of oriental tea-plants resulting from the attacks of great numbers of plant-bugs of the family *Capsidæ*. They breed upon the plant, and young and old suck its juices.

Mosquito Coast, or **Mosquitia**, Central America, an extensive region on the Caribbean Sea, forming the eastern seaboard of Nicaragua; area 26,000 square miles. For a considerable period it was governed, under British protection, by a native chief, but in 1860 it was made over to Nicaragua. (See CLAYTON-BULWER TREATY.) In 1894 it was incorporated with Nicaragua, and is now known as the department of Velaya. Capital, Bluefields.

Mosquito Fleet, in the navy, a term given to what is known as "the second line of defense," which is used in protecting the fortifications and harbors along the coast line, and, like the insect for which it is named, annoys the enemy in every way, at the same time preventing the possibility of a blockade. A fleet of this kind was organized during the Spanish-American War in 1898, and was composed of all sorts and kinds of ships to the number of about 130.

Mosquito Lagoon, Fla., a salt water lagoon on the east coast 30 miles long by one mile wide, separated by a sandy strip of land, half a mile to five miles wide, from the ocean, and connecting with the latter by Mosquito Inlet and Haulover Canal. It connects also on the north with Halifax River and on the south with Indian River. Fish and oysters are plentiful in its shallow waters, but mangrove swamps, sand and coral banks obstruct navigation even by the smallest boats.

Moss, Frank, American lawyer: b. Cold Spring, N. Y., 16 March 1860. He was educated in the public schools and in the College of the City of New York. In 1897 he was president of the board of police in New York and was counsel to the "Lexow Investigating Committee." In 1899 he was leading counsel for the "Mazet Investigating Committee," has since been connected with the Society for the Prevention of Crime and is professor of medical jurisprudence in the New York College and Hospital for Women. He is the author of 'The American Metropolis' (3 vols. 1897).

Moss, Lemuel, American Baptist clergyman: b. Boone County, Ky., 27 Dec. 1829. He was graduated from the University of Rochester in 1858 and for a time engaged in printing. He became pastor of the First Baptist Church of Worcester, Mass., in 1860 and thereafter held various important charges. He was president of the University of Chicago in 1874-5, and of the University of Indiana in 1875-84. He has been connected with various educational socie-

MOSS-ANIMALS—MOTH

ties and was president of the American Baptist Historical Society in 1895-1900. He has published: 'Annals of United States Christian Commission' (1866); 'A Day with Paul'; etc.

Moss-animals, or Bryozoa. See POLYZOA.

Moss-bunker, a common name about New York for the menhaden (q.v.). It is one of many forms of the Dutch name "marsbanker" for the scad, ignorantly applied by the early Hollanders, and has been misspelled and mispronounced in a great variety of ways. A detailed account of this matter will be found in Goode's 'Fishery Industries of the United States,' Sec. 1 (1884) as a part of the history of the menhaden.

Moss-pink. See PINK.

Mosses (*Musci*), a class of cryptogamous plants, forming with the liverworts (*Hepaticae*) the group *Muscineae* or *Bryophyta*. The only plants likely to be wrongly called mosses are the foliose liverworts, and these are readily distinguished by their two-ranked nerveless leaves, their four-valved capsule, and certain other characters. A germinating moss spore gives rise to a filamentous body called a *protonema*, from which buds arise and develop into the leafy shoots which constitute the true moss-plants. After a time the reproductive bodies are formed at the tips of certain shoots. The *antheridia*, or male reproductive organs, are club-shaped, and contain cells which afterward develop into the *antherozoids*. These antherozoids, when liberated from the antheridium, move about until they come in contact with an *archegonium*, or female reproductive body. The fertilized archegonium is then carried upward on a slender filament or *seta*, and now forms the fruit or *capsule*, usually closed by a lid or *operculum*, and often covered by a sort of hood called a *calyptra*. When ripe the capsule opens and liberates the spores, which by germination begin the life-history again. Mosses may also reproduce themselves asexually by the formation of buds or *gemmae*. There are no true roots in mosses, and the leaves are of very simple structure. New ones are continually springing from old shoots, so that in bogs the top remains growing while the underlayers die and the deeper ones slowly change into peat. Some five thousand species of mosses are known, of which about nine tenths belong to the order *Bryaceae*. This order comprises the two sub-orders, *Cleistocarpa*, with an indehiscent capsule, including the genera *Phascum*, *Ephemerum*, etc.; and *Stegocarpa*, in which the capsule opens by a lid. The stegocarpaceous mosses, again, may have the capsule either terminal (*Acrocarpa*) or lateral (*Pleurocarpa*), the former group including, among others, the genera *Grimmia*, *Fissidens*, *Polytrichum*, *Orthotrichum*, *Dicranum*, *Mnium*, *Bryum*, and *Funaria*, and the latter, *Hypnum*, *Leskea*, and *Climacium*. There are three other orders of mosses, namely, *Sphagnaceae*, or Bog-mosses, with only one genus, *Sphagnum*; *Andreeaceae*, with the single genus *Andræa*; and *Archidiaceae*, with the genus *Archidium*. Mosses are of little or no economic value, but they form an important part of the natural covering of rocks, and serve to prepare the way for higher forms of plants. Consult Strasburger, 'Text-book of Botany' (1903).

Mosses from an Old Manse, title of Nathaniel Hawthorne's second collection of tales and sketches (1854). The Old Manse, Hawthorne's Concord home, is described in the opening chapter of the book. The remaining contents include many of Hawthorne's most famous short sketches, such as 'The Birth-Mark,' 'Roger Malvin's Burial,' and 'The Artist of the Beautiful.' These bear witness to his love of the mysterious and the unusual; and their action passes in a world of unreality, which the genius of the author makes more visible than the world of sense.

Most, möst, Johann Joseph, German-American anarchist: b. Augsburg, Bavaria, 5 Feb. 1846. He learned bookbinding and traveled about the continent in pursuit of his trade. Later he was editor of the *Freie Presse* at Berlin, and in 1874-8 member for Chemnitz in the Reichstag. Expelled from the Socialist ranks in Germany, he went to London, where he founded *Die Freiheit*, an anarchistic sheet, in 1879. In 1881 he was arrested and sentenced to 18 months' imprisonment; and upon his release came to the United States. He continued *Die Freiheit* in New York. In 1901 he was arrested for a seditious editorial in his journal, and sentenced to a year's imprisonment, commencing June 1902. He published several anarchistical writings, such as 'Why I Am a Communist' (1890), and 'Down With the Anarchists' (1901).

Mosul, mō'sool, Asiatic Turkey, capital of a vilayet and sanjak of the same name, on the right bank of the Tigris, 220 miles northwest of Bagdad. A stone bridge continued by a bridge of boats crosses the river to the site of ancient Nineveh. The town is surrounded by decayed walls, and has houses of stone and brick, mosques, shrines, Christian churches, convents, etc. Formerly a place of much commercial importance, it has greatly declined, but it still carries on some trade, especially in gallnuts. Muslin is named from this town. Population about 61,000, mostly Mohammedans, but including many Christians and Jews.

Moszkowski, mösh-kōf'skō, Moritz, Polish composer and pianist: b. Breslau 23 Aug. 1854. At 19 he began to appear in public after studying at Dresden and Berlin. His success was immediate and striking and he made frequent concert tours. He is a talented composer; his opera 'Boabdil' was presented at Berlin in 1892; his other works include a ballet, 'Laurin'; a symphonic poem, 'Jeanne d'Arc'; some 'Dances espagnoles' for the piano or violin; and the two orchestral series called 'Les Nations.'

Mota-Padilla, mō'tā pä-dēl'yā, Matias de la, Mexican historian: b. Guadalupe, Mexico, 6 Oct. 1688; d. 1766. He was a lawyer, and during the latter part of his life a priest. He wrote among other works, 'History of the Conquest of New Galicia' (1870-1).

Motet', or Motett, a vocal composition in harmony, set to words generally selected from sacred writings. Like the madrigal, the motet was a first set to words of a profane character, and there are ecclesiastical decrees extant forbidding its use in church.

Moth, any insect of the order *Lepidoptera* not included among the butterflies (q.v.). Moths

MOTH

have antennæ of many forms, and on account of this variability are often grouped in a section *Heterocera*, but their antennæ are rarely swollen at the end, or "clubbed," and never in the North American forms. They are farther distinguished from butterflies by their wings being horizontal when at rest, and by their being seldom seen on the wing except in the evening or at night, although certain species of moth fly in the brightest sunshine, and some butterflies appear at twilight. In most cases there is a peculiar arrangement of interlocking spines (frenulum and retinaculum) by which the hind wings are kept in contact with the front wings during flight. The pupæ are never angular; are mostly smooth and dark-colored; and are often enclosed in a cocoon, which the larva spins before it passes into the pupal stage. Moths are comparatively larger than butterflies and more hairy or downy in character. A Brazilian giant measures nearly a foot from tip to tip, and there is a gilded species smaller than a pin's head. Similarly they present as great a variety of outlines and as much beauty (with less gaudiness) as do the butterflies; and they interest the philosophical naturalist by the extraordinary adaptations to conditions which many of them present, and which have come about in the development of the race. Some of the most extraordinary examples of sexual dimorphism, of protective coloration (q.v.) and resemblance, of mimicry (q.v.) and of curious armaments, are to be found among these creatures, whose small size, weakness, and edibility, especially when in the larval condition, render essential means of concealment and of passive defense. Nevertheless caterpillars of moths, as well as of butterflies, furnish a large part of the food of birds and of various other insect-eating animals; and in the adult state they are seized by night-flying birds, by lizards, monkeys, turtles, and by some predatory insects and spiders. The eggs of moths are laid upon the proper food-plant of the species, and are various in form, ranging from that of a sphere or a cylinder to that of a disk, often with the surface beautifully sculptured or ornamented. Each has a micropyle, or hinged opening from which the larva escapes. They are laid by most species of temperate regions in the early summer, and the life-cycle of the insect is completed before the end of the season; but some moths oviposit in the autumn, when their eggs remain quiescent through the winter, or, in some cases, hatch in time for the larva to partly grow, then hibernate and complete their development the following spring.

The larvæ or caterpillars of moths, like those of butterflies, hatch as very minute objects, but rapidly grow, shedding their skins (see *MOLTING*) at intervals to permit of enlargement, until some attain a length of six or seven inches. Most moth-larvæ molt five times, but some oftener and a few less times.

The larval condition is the insect's period of feeding and growth, some species taking no food whatever in adult life. The vast majority feed upon green vegetable food, leaves most of all; and are among the worst foes of our parks, orchards and gardens, attacking cultivated plants in a great variety of ways. "A few larvæ," remarks Holland, "feed upon woody tissues, and bore long galleries under

the bark or in the wood of trees." Others feed upon the pith of herbaceous plants. A number of species feed upon the inside of growing fruits. Only a very few species are known to be carnivorous. The household moths (*Tineæ*) are well known on account of the injury they work among clothes, carpets, furs, etc. Other species attack grain, meal, flour, hay, tobacco, dried herbs, drugs, and a variety of stored products; others bore into timber, or damage human property in some other way. Some recompense is obtained, however, from the silkworms (q.v.), the young moths whose cocoons furnish silk.

There is considerable variety in the form of the caterpillars of moths, but most are worm-like, and the structure and appendages resemble those of butterfly caterpillars (q.v.). The great majority possess besides the six minute thoracic legs the usual four pairs of "prolegs," or false feet, in the middle of the body, and a fifth pair on the hindmost (13th) segment (somite) of the body, which in reality are clasping organs needed for clinging to twigs in the process of molting. In some (numerous geometrids, noctuids, and psychids) these prolegs are reduced in number, and in the geometrids they are placed in only two pairs on the 9th and 13th segments, and these larvæ can progress only by looping the body upward (see *MEASURING-WORMS*). Other variations of this feature exist, as the sucker-like pads of the *Megalopygidae* and *Cochlididae*.

"The bodies of the larvæ of moths," to quote Holland, "are covered with tubercles, the location and arrangement of which have in recent years received considerable attention from students, and are thought to furnish a clue to the lines of descent of certain families. These tubercles sometimes carry only a single hair, in other cases they carry large tufts of hairs; they may be small and inconspicuous, or they may be developed until they assume the form of great spines, horns, or bulbous projections."

Some moth caterpillars exhibit bright and beautiful colors, and move about fearlessly, protected by thorny projections, or nauseous exudations, or by hairs which possess severe stinging properties. Others present striking examples of protective resemblance and mimicry, in color or form or attitudes, or all three respects. While many are solitary in their habits others are gregarious, forming "armies" and "processions" during their feeding life which disperse when the time for pupation arrives.

Many moth-larvæ enter the ground and surround themselves with an earthen cell in which to transform into and pass the pupal stage. Others spin cocoons in great variety, usually formed more or less of silk, and well protected against both the weather and enemies. Some are hidden away under leaves, beneath loose bark, in the crevices of rocks or old stumps, or fastened to the branches of trees. As a rule the cocoons are whitish or brown in color, never ornamented with the bright silvery or golden spots characteristic of the chrysalids of many butterflies. Escape from the tough silken kind of cocoons is aided by a copious saliva which dissolves or cuts the silk, so that the newly born insect may wriggle out.

The anatomy of the moths is substantially the same as that of butterflies, but in these

1 Gypsy Moth (*Porthetria dispar*), female: *a*, male; *b*, feeding caterpillar; *c*, pupa. 2. European Processionary Moth: *a*, feeding caterpillar. 3. Lackey Moth. 4. Tiger Moth and its "woolly bear" caterpillar. 5. Tussock Moth: *a*, caterpillar and cocoon with pupa. 6. *Psilura* Moth (*Psilura monacha*), female: *a*, male; *b*, eggs, young caterpillars and pupa, on the under side of a piece of bark; *c*, feeding caterpillar. 7. Pine Moth (*Gastropacha*), female: *a*, feeding caterpillar and cocoon; *b*, eggs.

FOLIAGE-EATING MOTHS.

1. Pepper Moth, with larva and pupa.
2. Red Underwing, with caterpillar.
3. Pine Moths, with caterpillar.
4. Group of Geometrid Moths.

5. Currant-worm Moth (*Abraxas*).
6. Gipsy-moth, illustrating development.
7. Black Arches Moth, in various stages.

MOTH

heterocerous families the head is not so prominent. The eyes, however, are often larger and better, as would be expected of insects mainly crepuscular in their habits; and some have the suctorial apparatus in high perfection, so that many of the hawk-moths and noctuids can poise upon whirring wings, and inserting the long proboscis suck nectar from flowers without alighting; and these take a considerable part in the cross-fertilization of plants. On the other hand, in the bombycine moths and their allies, the proboscis is small and some of them have no mouth-parts or ability to feed at all. "They are simply animate winged reservoirs of reproductive energy, and, when the sexual functions have been completed, they die."

The antennæ of moths assume a great variety of forms. They may be simple or branched, thread-like, fusiform, spatulate or like broad feathers; and those of the males frequently differ from those of the females. In an attempt at classification various subdivisions have been proposed, but lepidopterists no longer make artificial groupings of the families, whose inter-relationships seem very uncertain. Most of the families, of which about 50 are recognized by modern systematists, are represented in America, but several families are confined to the Oriental regions, and a few are exclusively African. The criteria principally used in separating families are found in the character and arrangement of tubercles, and in the structure of the wings. The lowest are the very small moths called *Micropterygida*, with bronzy golden wings, whose larvæ show striking affinities with the caddis flies, and feed in damp moss. The large yellowish-brown "swift" moths (*Hepialida*) come next, whose larvæ and incomplete pupæ live underground and feed on roots; followed by the *Zyganida* or burnet moths, which are small day-flying insects adorned with bright metallic colors. Their larvæ feed openly on various plants, and spin elongated cocoons. The tropical *Chalcosiida* and *Limacodliida* are allied to them; also the large, day-flying, brilliant tropical castniids, which have clubbed antennæ like butterflies. The small family *Megalopygida*, of hairy American moths, are singular in having seven pairs of prolegs. The *Psychida* are a small but universally distributed family characterized by the extreme degradation of the wingless females; the caterpillars live in portable cases made of sticks, grass, etc., and are called "basket worms" (q.v.). The *Cossida* are large moths, unable to feed, most numerous in the tropics and exemplified in Europe by the well known gnat and leopard moths (q.v.): only two species are North American; and the *Scsiida* are the clearwings (q.v.), resembling wasps. In the *Tortricida* is found a very large assemblage of small species known as leaf-rollers (q.v.), plentiful in the United States and embracing many pests, as the codling moth, etc. Another immense family of evil repute is the *Tineida*, represented by the clothes-moth, flour-moths (q.v.) and the like, which damage woolen goods, furs and stored products of every kind, as well as feed upon plants, some of them performing an essential work in cross-fertilization, conspicuously the yucca-moths (q.v.); there are thousands of species. The plume-moths (q.v.) come next, followed by a series of families

having obtect pupæ, which never emerge from the cocoon until the final molt. Among these are the *Pyralida*, a huge and varied family, having nearly 800 beautifully marked species in the United States alone, and largely destructive to cultivated plants. Representatives are the grape-leaf-folder, print-moth, sugar-beet moth, clover-hay worm, snout-moths, grass-moths, corn-stalk borer, bee-moth, leaf-crumplers, dried-current moth, and others, many of which are elsewhere described in this work. The egger-moths, tussock-moths (qq.v.) and some minor families are nearly related to the pyralids. The gayly colored tiger-moths (q.v.) carry the list to the owlet-moths (q.v.), which belong to the cosmopolitan nocturnal group *Noctuida*, and these are followed by several families, chiefly belonging to the Old World. Then come the *Sphingida* (see DEATH'S-HEAD and HAWK-MOTH), familiar all over the world; and the great assemblage of small, plainly but exquisitely colored geometrids (see MEASURING-WORM). Closely related are the tropical *Uraniida*, which contain large and magnificent green and gold tropical species—the glory of the forests of Brazil and the East Indies. Many of these, as of the Oriental family *Epicopiida*, are "tailed" and simulate the papilionid butterflies in many ways. Next to these are placed the silk-worm moths (*Bombycida*), and several families of large tropical moths, leading up to the great Saturnians (*Saturniida*), scattered over most of the warmer parts of the world; among them is the great *Attacus Atlas* of India, the largest of all *Lepidoptera*, and many of the largest, and most notable of American cocoon-making species, such as the *Ailanthus* silk-moth, the *Cecropia*, *Polyphemus*, *Luna*, and several others well known and elsewhere described.

The literature relating to moths is very extensive. The most complete and scientific account of the families, technically considered, is found in Hamson's 'Catalogue' of the moths of the world, published since 1898 by the British Museum. The Smithsonian Institution published simultaneously a 'List' of North American species by H. G. Dyar. The text-books of Packard and Comstock give sufficiently full accounts of structure; and Carpenter's 'Insects and their Structure' (1899), and Sharp's 'Insects' (Vols. I. and II., of Cambridge Natural History) (1895-9), contains a resumé of general information and of modern views as to relationships, phylogeny, etc. The best general illustrated descriptive work on North American species is W. J. Holland's 'The Moth Book' (New York, 1903), which contains an extensive classified list of books relating to the whole subject, including the splendid monographs of American families by Packard, Grote, Smith, Beutenmüller, Hulst, Dyar, and others.

Moth, Brown-tailed, a moth (*Euproctis chrysorrhœa*) of the family *Liparida*, accidentally imported from Europe, and nearly related to the gypsy and tussock moths. Its color is tawny brown, deepening toward the end of the body. The caterpillars defoliate trees, and have done much local damage in the neighborhood of Boston, as well as become an annoyance by their flying hairs which irritate the skin; but the insect is not so much feared as is the gypsy moth. This moth lays in midsummer about 250

MOTHER ANN—MOTLEY

eggs underneath the tip of a leaf, and covers them with its hairs. The larvæ appear after about a fortnight, and begin to eat the green substance of leaves, skeletonizing them; they also feed on apples and pears. In mid-autumn they form cases of bits of leaves, attach them to twigs by silken strands, pass the winter in them, complete their growth the following spring, feeding on foliage, flowers, and fruit, and then pupate in June, and emerge in mid-summer.

Mother Ann. See LEE, ANN; SHAKERS.

Mother Carey's Chicken, any of several small oceanic petrels (q.v.); specifically, in the Mediterranean and Atlantic, the storm-petrel (*Procellaria pelagica*) often seen about ships, especially in wild weather, and looked upon with superstitious dread by sailors. Its manner of paddling along the surface of the waves suggested the name petrel, namely, little Peter (the Apostle), afterward transferred to the whole group; and the "Mother Carey" is supposed to be a queer Anglicization of the Italian sailor's prayerful exclamation: "*Maria Cara!*" (Dear Mother Mary), when he saw the birds hovering about the ship portending a gale and possible disaster. These little petrels are about six inches long, sooty black, with white rumps and a little white on the wings. They breed numerous on all northern coasts, as about Newfoundland, Labrador, North Greenland, and the British Isles, wherever suitable places can be found, occupying holes in the face of earth banks, like bank-swallows, and rarely approaching or leaving their nests, each with a single white egg, except at night.

Mother of Cities, the euphemistic local title for Balkh (q.v.), Central Asia.

Mother Goose's Melodies, the well-known collection of nursery rhymes. In 1800 a story was started to the effect that "Mother Goose" was a Boston woman; and she was identified as Elizabeth Goose, widow of Isaac Vergoose, or Goose, and mother-in-law of Thomas Fleet, a Boston printer, who issued a collection of the 'Melodies' in 1719. It is now conceded that "Mother Goose" belongs to French folk-lore and not to English tradition. Charles Perrault (q.v.), b. Paris 1628, was the first person to collect, reduce to writing, and publish the 'Contes de Ma Mère l'Oye,' or 'Tales of Mother Goose,' though he did not originate the name; and there is no reason to think that "Mother Goose" was a term ever used in English literature until it was translated from the French equivalent, "Mère l'Oye."

Mother-of-Pearl. See PEARL.

Mother of Presidents, in American history, a name given to Virginia because that State has given six chief executives to the Union, namely: Washington, Jefferson, Madison, Monroe, Harrison, and Tyler.

Mother of States, in American history, a name given to Virginia, from the fact that out of the original Colony of Virginia were formed the States of Kentucky, Ohio, Indiana, Illinois, and West Virginia.

Mothers' Clubs, organizations of women in various American cities designed to better the condition of the home, and aiming to formulate improved methods for the moral train-

ing and education of children. The most prominent of these societies is the New York Mothers' Club. There is a New York State confederation of these societies which holds annual meetings.

Motherwell, muth'ér-wél, William, Scottish poet and antiquary: b. Glasgow 13 Oct. 1797; d. there 1 Nov. 1835. Educated at Edinburgh and Paisley, at 15 he was apprenticed to the sheriff-clerk of the latter town, and in 1819-29 was sheriff-clerk depute. It was while in this situation that he did his best work both as poet and ballad-collector. After editing the collection of songs called the 'Harp of Renfrewshire' (1819), he compiled the more important collection of ballads published in 1827, under the title of 'Minstrelsy: Ancient and Modern,' with a historical introduction and notes. He became editor first of the Paisley 'Advertiser' (1828-30) and then (1830) of the Glasgow 'Courier.' He published in 1832 original 'Poems: Narrative and Lyrical.' Some of his lyrics are familiar in anthologies.

Motherwell, Scotland, a town in the county of Lanark, 12 miles southeast of Glasgow. It is of comparatively recent origin, and takes its name from three farms called High, Low, and North Motherwell, which again derived their names from an adjoining spring, which in Roman Catholic times was dedicated to the Virgin Mary, and called the *Well of our Lady*, or *Mother's-Well*. The inhabitants are chiefly employed in the neighboring coal-mines, iron and steel works, foundries and engineering shops. Motherwell has some good churches, a town-hall, public park, good water supply, electric light, etc. Pop. (1901) 30,423.

Motherwort, a labiate plant (*Leonurus cardiaca*) with rigid branched stem 3 feet high, flowers in crowded whorls, white with a reddish tinge, upper lip of corolla shaggy, calyx with pungent spreading teeth; leaves petiolate, lower ones palmately cleft, upper ones three-lobed. The plant, with two or three related species, frequents waste places, and is not uncommon in North America, where it has been introduced from Europe. An infusion of it was formerly much employed in chest diseases.

Motif, mô-téf'. See LEITMOTIV.

Motion. See MECHANICS.

Motley, môt'li, John Lothrop, American historian: b. Dorchester, Mass., 15 April 1814; d. near Dorchester, England, 29 May 1877. His education was obtained at Harvard, from which he was graduated in 1831, and at the universities of Berlin and Göttingen, between which he divided two years (1832-3). His first published writings were contributions to Willis' 'American Monthly Magazine,' and "verses in the corner of a paper called the 'Anti-Masonic Mirror.'" His first book, the two-volume, semi-autobiographical 'Morton's Hope' (1839), met with a generally unsatisfactory reception; and, according to Holmes, the 'North American Review' "dropped a small-print extinguisher upon it." He went to St. Petersburg in the autumn of 1841 as secretary to the American legation, but after a brief residence returned (1842). His first important attempt in history was a 50-page article, nominally a review but really a narrative, on Peter the Great, in the 'North American' for October 1845 (in book-form in the

MOTMOT—MOTOR AREA

(‘Half-Hour’ library). His further literary work during this period includes notable essays on Balzac (July 1847) and the ‘Policy of the Puritans’ (October 1849) in the ‘North American’; and a second effort of fiction, ‘Merry Mount’ (1849), certainly an advance on the first, and rewarded by a nearly 20-page notice in the ‘North American,’ but clearly not a success. But so early as 1846 he had been gathering material for a history of Holland. Having learned that Prescott, then at the height of his reputation, was busy upon the ‘History of Philip II,’ Motley had a conference with Prescott, who urged him to continue, even though the two works would unavoidably cover the same ground. For the year 1849 he was a member of the Massachusetts house of representatives; and he often humorously referred to his experience when an extensive and, as he fancied, impregnable report prepared by him as chairman of the committee on education was triumphantly demolished by George S. Boutwell (q.v.), then a young representative from Groton. From 1851 until 1856, the year of the appearance of the ‘Rise of the Dutch Republic,’ he was in Europe, continuing his investigations at Berlin, Dresden, The Hague, and Brussels. When, after ten years’ labor, the great work was at last ready for the press, it had to be published at the author’s expense. It was received with almost universal praise by public and critics—Froude writing, “one of the earliest as well as one of the most important recognitions”—and definitely established Motley’s fame. It was widely translated, Guizot superintending the French version and writing the introduction. Motley was in America in 1856–8, but then returned to Europe. In 1861 he wrote two letters, then of great timeliness and importance, to the London *Times*, setting forth to the English nation the structure of the United States government, the causes of the Civil War, and the results involved. From 1861 until his resignation in 1867 he was United States minister to Austria, and his official despatches in this post were highly praised by John Jay, his successor. He returned to the United States in 1868, in 1869 was appointed minister to England by Grant, but in 1870 was suddenly recalled. This action by the government was never explained with any degree of satisfaction. The correspondence between Motley and Fish, secretary of state, is to be found in a publication of the State Department (1871). It would appear that Holmes’ verdict that Motley was greatly wronged is the correct one. Sumner said: “How little Mr. Motley merited anything but respect and courtesy from the secretary is attested by all who know his eminent position in London and the service he rendered to his country.” Motley continued writing until 1873, and in 1875 paid a visit to the United States. His other two famous works are the ‘History of the United Netherlands, from the Death of William the Silent to the Twelve Years’ Truce, 1609’ (1866), and ‘The Life and Death of John of Barneveld, Advocate of Holland: with a View of the Primary Causes of the Thirty Years’ War’ (1874). They confirmed his rank as a great historian, some of the best Dutch critics thought the ‘Barneveld’ his chief publication. His style is precise and brilliant; his narratives are full of movement, his portraiture vivid.

Consult Holmes (O. W.), ‘John Lothrop Motley: A Memoir’ (1878).

Motmot, a bird of the tropical American family *Momotidae*, allied to the kingfishers and todies, of which about 15 species are known, all in the genus *Momotus*. They inhabit the forests, as a rule, and are usually solitary in the daytime, perching with the head drawn between the shoulders, solemn and still except for an occasional melancholy croak from the repetition of which they derive their name, originally French and pronounced *mo-mo*. They are most lively at early morning and in the dusk of evening, pursuing insects in short flights; they also eat fruits, lizards, and snakes, which are tossed into the air from the point of the bill and swallowed; they sometimes devour the eggs of other birds. The nest is made in holes of trees or banks of earth. The motmots are birds of brilliant plumage, with one striking peculiarity. The two middle feathers of the long-tail are much prolonged, and are always more or less denuded of vanes on both sides of the shaft except near the tip, giving a racket-like shape to the feathers. This seems to be the result of a habit in the bird of gnawing its feathers, which begins as soon as their growth outreaches the other recrices. The best known species is the Brazilian motmot (*M. brasiliensis*), about the size of a blackbird, of a deep rich green color, with bluish forehead, violet back of head, and black crown. One of the Mexican species (*M. caruleps*) occasionally crosses the line into the United States.

Motor, a machine for transforming natural energy in various forms into mechanical work, the term in the widest sense embracing wind-mills, water-wheels and turbines, steam-engines and steam-turbines, the various kinds of gas-engines, compressed-air motors, petroleum motors, electric motors, etc. Steam, hot-air, gas, and petroleum motors together constitute the group of *thermic motors*, because in all of them the source of energy is heat. See DYNAMO.

Motor Area, that portion of the brain in which the cells that govern the voluntary muscles of the body are located. The motor area is confined more distinctly to the cortex, or outer surface of the brain on either side of the fissure of Rolando, making up the areas known as the anterior central and posterior central convolutions. In these areas are numerous motor cells, the destruction of which, or interference with the tracts of fibres that go from which, results in impaired function of the muscle corresponding to the cells or the fibres interfered with. The motor area in the right side of the brain controls the voluntary muscles of the left side of the body and the right hand and leg are controlled by the left side of the brain. The tracts of fibres that come from one side pass the middle line at the lower level of the medulla, the decussation of the pyramids. The motor area itself is subdivided into irregular areas, or centres, as they are loosely called—an arm-centre, a leg-centre, etc. In these more or less clearly delimited areas the cells governing the voluntary muscles of a leg or an arm are grouped. In much the same manner the nerves of the muscles of the face and of the eyes, tongue, etc., have their locations of origin in certain portions of this general motor area. Irritation of the

MOTOR CARS—MOTTLED OWL

motor area usually causes excessive muscular movements, or convulsions, and destruction results in loss of motor power or paralysis. See **BRAIN**; **CONVULSIONS**; **PARALYSIS**.

Motor Cars. See **AUTOMOBILES**.

Motor Co-ordination, correct relation of the will to do a deed and the muscular action necessary to its performance. When by an act of will one determines to button a coat, to throw a ball, or to mount a flight of stairs, the motor cells in the motor area (q.v.) of the brain set free a certain number of impulses to the various muscles that may be utilized in the act to be performed. These impulses travel down from the brain to the muscles in specified brain-tracts, and transmit to the muscles the requisite stimuli. The estimating of the desired effort necessary to the best performance is largely an affair of the sensory nervous system. The result of this, as tactile sense or as muscle-sense, is sent from the skin to the brain, where the proper record is made, and co-ordination is made complete and effective. Any interference with the sensory incoming stimuli or with the outgoing motor impulses may cause inco-ordination. See **BRAIN**; **CO-ORDINATION**.

Motor System (OF ANIMALS). See **ANATOMY, COMPARATIVE**.

Mott, James, American philanthropist: b. North Hempstead, L. I., 20 June 1788; d. Brooklyn, N. Y., 26 Jan. 1868. He was a teacher in a Friends' boarding school in Dutchess County, N. Y., at 19, where he married Lucretia Coffin and in 1810 went to Philadelphia, Pa., where he engaged in the mercantile business. He amassed a fortune and retired from business and thereafter devoted himself to various reforms in which he had always evinced a deep interest. He was a staunch friend of William Lloyd Garrison (q.v.), assisted in the organization of the Philadelphia Anti-Slavery Society in 1833 and attended as a delegate the World's Anti-Slavery convention in London in 1840. He was a determined supporter of the cause of woman's rights and in 1848 presided over the first woman's rights convention at Seneca Falls, N. Y. He afterward assisted in the establishment of Swarthmore College near Philadelphia. He published 'Three Months in Great Britain.'

Mott, Lucretia Coffin, American reformer: b. Nantucket 3 Jan. 1793; d. near Philadelphia 11 Nov. 1880. With her parents, Thomas and Anna Coffin, she removed to Boston in 1804, and four years later became a teacher in a Quaker boarding school, where she met James Mott (q.v.), to whom she was married in 1811, having removed to Philadelphia in 1809. There she opened a Friends' school in 1817, and began to preach a year later. She joined the Hicksite branch of the Quakers upon the schism of 1827. In 1833 she joined in the formation of the American Anti-Slavery Society, as whose delegate she went to the London World Convention in 1840, from which all women were excluded. The result was the woman's rights movement, in which Mrs. Mott became a leader, taking a prominent part in the convention held at Seneca Falls in 1848. She attended personally as many cases under the Fugitive Slave Law as was physically possible, and took a part in other charities and reforms. Consult: Hallowell, and 'Letters of Lucretia and James Mott' (1884).

Mott, Valentine, American surgeon: b. Glen Cove, N. Y., 20 Aug. 1785; d. New York 26 April 1865. He was of Quaker stock, the son of a physician; studied medicine at Columbia, in London under Astley Cooper, and in Edinburgh University; and in 1806 began to practise in New York, where he was professor of surgery at Columbia 1809-13, at the College of Physicians and Surgeons 1813-26, and at the Rutgers Medical College 1826-30, to return again to the College of Physicians and Surgeons for five years. He was one of the founders of the New York University Medical School. He was a fearless and able surgeon; could use the knife with either hand; introduced many new surgical tools, perfected the use of anaesthetics; performed more than 1,000 amputations, was notably the first to amputate at the hip joint successfully, and operated for stone more than 150 times. He was particularly skilful in tying veins, in one famous case tying the jugular vein in two places, and more than 40 arteries. He traveled in Europe each year between 1835 and 1841, and operated on the sultan of Turkey. He was a conservative surgeon, in spite of his skill, and used the knife sparingly. He edited Townsend's version of Velveau, 'Surgical Anatomy.' Consult: Memoir by Francis (1865), and that by Gross (1868).

Motte, möt, Fort, a former fort of Revolutionary days, on the Congaree River, S. C., about 33 miles below Columbia.

Mottl, möt'l, Felix, Austrian musician: b. Vienna, Austria, 24 Aug. 1856. He was educated at the Conservatorium in Vienna and afterward assisted Richard Wagner and Liszt. In 1886 he became a musical director at Baireuth and in 1893 assumed control of the opera at Carlsruhe where he presented the first performance of Berlioz' great opera, 'Les Troyens.' His songs and minor compositions are not important, but his operas 'Agnes Bernauer' (1880) and 'Fürst und Sanger' (1893) have met with marked success.

Mottled Owl, a small horned owl (*Megascops asio*), which, in one or another geographical variety, occurs numerously all over the continent, except in the colder parts of Canada. Very similar species are known in Central America and in Japan. It is only nine or ten inches long, with large facial disks, two small erectile horns lending great alertness to the countenance, and a short rounded tail. Its plumage is a pretty mottling of gray and rust-red, and presents a prominent illustration of dichromatism, since in some specimens it is purely gray and in others a decided red, without reference to age, sex or health. There is otherwise much variability in both form and plumage. These little owls are entirely nocturnal and are almost blinded by daylight glare. They come out in the dusk of evening, and from sunset to darkness, or all night when the moon is shining, is heard their low, musical, trilling cry—one of the pleasantest of bird-voices; yet in some evil way the name *screech-owl* was long ago fastened upon this bird. It makes its home in the hollow of some stump or dead tree, or often in a cranny in the wall or cornice of a building, and is becoming more and more familiar with man, as better knowledge makes him more tolerant of its harmless presence. Its eggs are 5 to 7, pure white. The

MOUCHEZ — MOUND BUILDERS

food of the mottled owl is chiefly small rodents and insects, and occasionally, in spring, small birds; they destroy a vast number of insects and mice hurtful to the farmer and gardener. Books upon American birds abound in facts as to their habits.

Mouchez, Amédée, ä-mä-dä moo-shä, French astronomer: b. Madrid, Spain, 24 Aug. 1821; d. Wissous, France, 25 June 1892. He was educated in the French Naval Academy and remained in the navy until 1878 when he was appointed chief of the National Observatory. He had previously shown himself a brilliant scientist and particularly distinguished himself in coast surveys of Algeria and Brazil as well as in the observation of the transit of Venus in 1874. He bent all his energies to the improvement of the observatory, introduced several innovations of value, and was the originator of the international photographic chart of the heavens. He wrote: 'Côtes du Brésil (1869-76)'; 'La Photographie astronomique et la Carte du Ciel' (1877); etc.

Mouflon, moo'f'lön, or **Musimon**, a wild sheep (*Ovis musimon*) of Corsica and Sardinia, where it wanders about the summits of the mountain ranges in small flocks, and offers excellent sport. It is a question whether this species ever existed on the mainland, one opinion being that it arose in the isolation of the islands; but most naturalists believe that it formerly existed in Spain. The rams are about 2¼ feet tall at the withers, and have very large coiled horns, but the females are hornless. The long mane-like hair that covers the neck and chest of the rams is gray, but the remainder of the coat is mainly rust-red above and white on the ventral surfaces. A similar "mouflon" inhabits Cyprus; and the Barbary aoudad (q.v.) is often called "ruffed mouflon."

Moukden'. See MUKDEN.

Moulding. See MOLDING.

Moulds. See FUNGI.

Moule, mool, **Handley Carr Glynn**, English Anglican bishop: b. Dorchester, Dorsetshire, 1841. He was educated at Cambridge University, took orders in the Anglican Church, and was an assistant master at Marlborough College 1865-7. From 1873 to 1876 he was dean of Trinity College, Cambridge, and he was first principal of Ridley Hall, Cambridge, 1881-99. He was nine times select preacher at Cambridge and once at Oxford, was Norrisian professor of divinity at Cambridge 1899-1901 and in the last named year was consecrated bishop of Durham, succeeding Bishop B. F. Westcott (q.v.). He has published many devotional and expository works, among which are: 'Thoughts on Christian Sanctity'; 'Ephesian Studies' (1900); 'The Secret of the Presence' (1900); 'Thoughts for the Sundays of the Year' (1901).

Moulton, möl'tön, **Ellen Louise Chandler**, American poet; b. Pomfret, Conn., 10 April 1835. She was married to William U. Moulton, a Boston publisher, in 1855 and has since lived in Boston. She has a wide literary acquaintance both in this country and in England, where she has spent a part of every year for many seasons. Her weekly receptions both in Boston and London are the resort of many literary and artistic persons. She has published such books for children as 'Bedtime Stories' 1873-5-80, while

her other writings include 'Some Women's Hearts' (1874); 'Miss Eyre from Boston' (1889); 'In the Garden of Dreams'; 'Lyrics and Sonnets' (1890); 'Lazy Tours in Spain and Elsewhere' (1896); 'At the Wind's Will,' verse (1899); etc. Her lyrics are extremely musical and as a sonneteer she ranks among the first.

Moulton, Richard Green, Anglo-American educator: b. Preston, England, 5 May 1849. He was graduated from the University of London in 1869 and at Cambridge University in 1874, since when he has lectured in various American and English universities, and has been professor of English literature in the University of Chicago from 1892. He is the author of: 'Shakespeare as a Dramatic Artist' (1885); 'The Ancient Classical Drama' (1890); 'An Account of an Experiment in the Study of Fiction' (1895); 'Literary Study of the Bible' (1896); 'The Moral System of Shakespeare' (1903); etc.

Moultrie, möl'trī, **William**, American soldier: b. South Carolina, 1731; d. Charleston, S. C., 27 Sept. 1805. He early allied himself with the military forces of the colonies and in the war with the Cherokees in 1761 the confidence of his fellow citizens in his ability was shown by his selection as captain of the regiment raised to defend the frontier against the Indians. At the outbreak of the American Revolution in 1775 he was appointed colonel of the 2d colonial regiment and he also served as member of the South Carolina provincial congress in that year. He was engaged in the seizure of the public arsenals and the construction of fortifications around Charleston, and in March 1776 was ordered to construct a fort on Sullivan's Island. This he made of the only material at hand, palmetto logs, and when General Lee made an inspection he expressed his disapproval of the work, considering it totally unfit for the purpose of defense and advised its abandonment. Moultrie, however, continued the work and when an attack was made by the British fleet under Sir Peter Parker the rude fort successfully withstood all assaults and was subsequently named for its brave commander. He was promoted to the rank of brigadier-general in recognition of his services and given command of the forces in South Carolina and Georgia. So complete had been the defeat of Parker, however, that Charleston was not again attacked until 1779 when the British availed themselves of the absence of a large share of the Continental force and attacked the town. The return of General Lincoln saved the city, but in the spring of 1780 a third attack by land and sea compelled capitulation. Moultrie was held a prisoner for two years and though offered rank and money to enter the British army remained loyal to the cause of the colonies. Release came in 1782 and though promoted to the rank of major-general it was too late for him again to engage in active service. He was elected governor of South Carolina in 1785 and in 1794, and published in 1802 'Memoirs of the Revolution.'

Moultrie, Fort. See FORT MOULTRIE.

Mound Birds, a group of Australasian gallinaceous birds remarkable for the large mounds which they build as incubators for the eggs. See MEGAPODES.

Mound Builders, **The**, a general term popularly applied by antiquarians and ethnologists to the aboriginal race of people residing on the

MOUND BUILDERS

American continent, and by whom the various earthworks called Indian mounds, forts, etc., were constructed. Scientists have never agreed as to the connection of the mound builders, so-called, with the American Indian known first to civilization in the 16th and 17th centuries. Many ethnologists claim the mound builders and the Indians were one and the same people, while others hold that the aborigines were an entirely different race.

In North America.—The architectural remains of the mound builders are to be found in each of the grand divisions of the continent. That portion of the United States which lies between the Appalachians and the Rocky Mountains presents in three groups at once the oldest and the rudest monuments of by-gone times; the first group extending from the sources of the Allegheny to the waters of the Missouri; the second occupying the Mississippi Valley, vaguely so defined; and the third stretching from South Carolina to Texas. These several groups, apparently with very little difference among themselves, consist of numberless mounds, and circumvallations of earth and stone—1,500 of the latter, and 10,000 of the former, being said to exist in Ohio alone. The erections themselves range from 5 to 30 feet in height; while the areas enclosed—generally of some symmetrical figure, such as circle or ellipse, rectangular parallelogram or regular polygon—vary from 20 to 40 acres, though among a few of greater extent, one in Arkansas is stated to embrace a square mile. The circumvallations, moreover, seem generally to contain the mounds; and sometimes a smaller circumvallation is surrounded by a larger one. Whether these colossal structures were intended for worship or for defense, it is impossible to decide; more probably, however, they were of a military character, provided, as they generally were, with cisterns for water. But, whatever their origin, they derive interest from the analogous fact that, within the same territorial limits, have been dug up vases of earthenware or copper in elegant forms, pipe-bowls decorated with human heads of the type of the existing aborigines, or with those of birds, etc., domestic utensils, personal ornaments, hatchets of stone, and, lastly, weapons of copper or mica, or shell or obsidian.

In South America.—The architectural remains of Central and South America are at once of more modern origin and more elaborate character, and may be roughly compared with the cyclopean ruins in Italy and Greece. Uniformly in the pyramidal style—a style likely enough to be indigenous in a region of earthquakes—they are composed of blocks generally huge, and sometimes enormous; those in the walls of Tiahuanaco in Bolivia being equivalent to cubes of about 16 feet each way. Between those of South America and Central America, however, there are diversities as well as resemblances. Those of South America, situated, as they are, within the native limits of Peru, and referred, as they must be, to its closing era under the Incas, cannot reach back beyond the Spanish conquest more than 300 or 400 years. Those of Central America, again, are reckoned to be considerably more ancient, reaching five or six centuries further back, and being partly the work of the Aztecs, whom the Spaniards conquered, and partly of the Toltecs, whom the Aztecs had themselves supplanted. Nor is the fact alto-

gether without significance that, in the two more southerly divisions of the continent, those mysterious records of the past are generally superior in development in proportion as they are anterior in age; those of Central America, as a whole, surpassing those of South America; and, again, within Central America itself, the earlier specimens of Oaxaca, Guatemala, and Yucatan, eclipsing the later ones of Mexico proper. While attempting, in the light of these remains, to appreciate aboriginal civilization, one cannot fail to be struck rather with their magnitude than with their beauty, rather with the evidence of despotism in the ruler than with traces of skill in the subject.

Prehistoric Copper Mines.—Among recent discoveries was that of a prehistoric copper mine on the Isle Royale in the northern part of Lake Superior. These mines were worked many years before Columbus was born, by the prehistoric races who procured from them metal for their implements and ornaments. The copper occurs there in masses of the pure or "native" metal, embedded in the volcanic rocks, and the primitive miners were accustomed to dig it out with no better tools than stone sledges. Although the island is not adapted for human habitation, tribes from all the surrounding country gathered there in ancient times for the purpose of obtaining the precious material. In order to find it a great deal of "prospecting" had to be done, and thus the surface of the hills to-day are everywhere found covered with old pits and trenches, partly filled up and overgrown with pine forests. In these ancient holes are discovered numerous stone implements which bear the marks of use as mining tools. So thickly are such rude tools scattered about that not less than 50,000 of them are to be seen on the surface of the ground, affording an illustration of the extensive character of the work that was carried on. The copper was sometimes found in masses so big that they could not be removed, and many such gigantic nuggets of pure metal have since furnished bonanzas to the whites, who for years made a business of exploring the old workings in search of them. One nugget weighed 12,000 pounds, and because it was not practicable to cut it up or blast it into pieces it had to be conveyed bodily to the lake shore and carried away in a vessel, requiring much ingenuity and the best modern appliances for the successful accomplishment of the task. When the natives came across such a mass of copper the best they could do was to break off a few projecting pieces of it. The business of prospecting for such abandoned nuggets was finally given up by the whites, because they ceased to find enough of them to pay, although more than 1,000 pits remain untouched by them. After the miners of antiquity had got the copper they hammered it into tools and ornaments, which were carried to all parts of North America and distributed by trade. Such articles, for which the material was originally obtained from Isle Royale, are found to-day in mounds and graves throughout this country and not infrequently as far away as Central America.

Flint Quarries.—In Arkansas is a prehistoric quarry where flint for making into tools and weapons was procured on so extensive a scale that in places the hills and mountains have been actually remodeled by the pittings and trenchings. From one hillside it is estimated that upward of 150,000 cubic yards of flint have been

MOUND BUILDERS

removed and worked. Another locality explored in Indian Territory yielded for the purposes of the aborigines a chalky kind of flint, which was procured in enormous quantities for making large implements, such as hoes and other agricultural tools, and also knives that were very long, slender and thin. It was useful to select pieces of best quality for the manufacture of knives, just as nowadays the finest steel is employed for cutlery. A third great quarry in Ohio, near Newark, worked on a very extensive scale, supplied a beautiful flint of fine grain for arrow-points and spear-heads. It furnished with these articles an extent of territory equal to a half dozen States, and they are found to this day as far south as Tennessee and as far east as New York.

The Grave Creek Mound.—One of the most interesting mounds of North America is that known as the Grave Creek Mound, located 12 miles below Wheeling, W. Va., on the left bank of the Ohio River, near Moundsville. The mound is situated on an elevated table-land, and is an artificial truncated mound, some 70 feet high and 900 feet in circumference at its base. The mound was built by a race superior and previous to Indians, and is the most notable mound in the Ohio Valley. Its cubic contents are equal to the third pyramid of Mycerinus, but was heaped up by a people destitute of the knowledge of iron, and who had no domestic animals or machinery to aid them. They were evidently people like the Egyptians, ruled by some one monarch, who was able to combine vast numbers in the erection of one structure, and, at the same time, able to provide them with food in abundance. The mound builders cultivated the soil like Egyptians, and had maize for their food, as the date and leek and onion supplied the wants of the laborers on the Nile. No Indian was ever known to toil in this manner. No government existed among the Indians that could bring them to such servitude. The authority of a chief or sachem is too slender a thread for such a people. It must be remembered that in Egypt to build one of the pyramids required the labor of 360,000 men for 20 years. This mound was visited by white men at a very early date, for, in 1818, one of the large trees growing on the mound bore the date of 1734, and several names cut in the bark were yet distinguishable. A. Tomlinson, the owner of the mound, was induced—by his neighbors and friends in Wheeling—to open the mound, which he did in 1838. From the north side he excavated toward the centre an adit 10 feet high and 7 feet wide along the natural surface. At the distance of 111 feet he came to a vault that had been excavated in the earth before the mound was commenced; 8 feet by 12 feet square and 7 feet in depth. Along each side, and across the ends, upright timbers had been placed, which supported timbers thrown across the vault as a ceiling. These timbers were covered with loose unhewn stone, common in the neighborhood. The timbers had rotted, and the stone tumbled into the vault. In this vault were two human skeletons, one of which had no ornaments. The other was surrounded by 650 ivory beads and an ivory ornament about six inches long. A shaft was also sunk from the top of the mound to meet the other. At 34 feet above the first or bottom vault, was found another, similar to the first. In this vault was found a skeleton which

had been ornamented with copper rings, plates of mica, and bone beads. Over 2,000 disks cut from shells were found here. The copper rings, or bracelets, found, weighed about 17 ounces.

North Carolina Mounds.—In 1880, about four miles from Wolf Creek, North Carolina, a mound eight feet high was found and opened. After digging to the surface of the earth on the edge, the investigators went through to the centre, and found a skeleton. After getting out 54 bones, including the skull and chest, they traced him out to get his length. He was, as nearly as could be determined, seven feet in length. From the appearance of his jaw-bone, he must have been a very large man. Nothing else was found except a small rock that had been broken, about three inches long, perfectly smooth, and with a small hole through it, which it is supposed was used for a pipe-stem. Around the skeleton was a row of burnt rock; under this ashes and fire-coals.

Mounds in Ohio.—While mounds are common throughout the Mississippi Valley, Ohio is most prolific in these remains. It has been estimated that over 10,000 mounds have been found and over 500 examined in the district between Lake Erie and the Ohio River. On Kelley's Island in Lake Erie, not far from Toledo, are many evidences of a prehistoric people and numerous mounds are to be found there. The serpent mound near Peeble's Station, Adams County, Ohio, is one of the most unique and interesting relics of the mound builders. It is an earthen structure in the form of an immense serpent, some 1,300 feet in length. Near Canal Winchester, Ohio, in a large mound was found a collection which consisted of 54 copper pieces representing button-shaped ornaments, celts, large plates and bracelets. All had been hammered together evidently to destroy their identity. Some of the plates if straightened out would measure eight and one-half inches long and four inches wide. With the copper pieces were found five broken pieces of slate ornaments and 34 pieces of galenite, and over all were placed quantities of mica in sheets, and all were found one foot below the surface and placed within the space of 18 inches by 24 inches. The Butcher mound, so called from W. C. Butcher, is located near Homer, Ohio, on the Licking River. It is 500 yards from the river, upon a level plateau, 15 feet above the river bed. On the north side of the mound is a large walnut stump, three feet nine inches in diameter. Large maple trees are growing upon the mound, the largest being 18 inches in diameter. The top of the mound is perfectly flat, forming a platform having an area of more than 1,600 square feet. The mound is 13 feet high and 135 feet in diameter north and south, and 126 feet in diameter east and west. In this mound was found a skeleton, that of an adult, buried one foot below the surface and covered with 96 small granite boulders averaging five inches in diameter. The skeleton was badly decayed and only a few pieces of ribs and vertebrae could be saved. The evidence obtained from the exploration of this mound is sufficient to justify the conclusion that the mound was built for burial purposes, and in some religious ceremony the body or bodies were cremated in the large fire-pit in the centre of the mound. In a swamp near Copley, Summit County, Ohio, is a large mound 200 feet wide, surrounded by a ditch 13

MOUND CITY—MOUNT CARROLL

feet across. This has been named Fort Island. Similar ancient earth forts, with exterior ditches, are often seen in Ohio, occupying the crown of a hill. By flooding the swamp this would become an island, equally inaccessible, as a precipitous hill. The race of ancient earth builders thoroughly appreciated the military advantages of position. In Florida the Spaniards found Indian stockades surrounded by running water. Champlain found similar works among the Iroquois in 1513, which he attacked in the valley of the Onondaga. See *ARCHÆOLOGY, AMERICAN*.

Consult: Carr, 'Mounds of the Mississippi Valley,' and works by Schoolcraft, Peet, and others; also various reports and monographs published by the Bureau of Ethnology, Smithsonian Institution, Washington; and the Peabody Museum of Archaeology, Cambridge, Mass.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Mound City, Ill., city, county-seat of Pulaski County; on the Ohio River, and on the Illinois C., and the Cleveland, C., C. & St. L. R.R.'s; about 200 miles south of Springfield and eight miles north of Cairo. It is in an agricultural section, but the principal industries are connected with manufacturing and trade. The chief manufactures are furniture, pumps, staves, headings, and other lumber products, boxes, trunks, ice, foundry and machine shop products. It has considerable trade in its own manufactures and in farm products. A National Cemetery, located here, contains 5,310 graves of which 2,732 are of unknown dead. Pop. (1900) 2,705.

Mound City, Mo., city in Holt County; on the Chicago, Burlington & Quincy railroad; about 40 miles north by west of Saint Joseph. It is situated in a fertile agricultural region in which farming and stock raising are the chief occupations. Its principal manufactures are canned fruits and vegetables and dairy products. Its trade is in farm products and live stock. In the vicinity are numerous mounds belonging to the age of the Mound Builders (q.v.). Pop. (1890) 1,193; (1900) 1,681.

Moundsville, Moundz'vil, W. Va., city, county-seat of Marshall County; on the Ohio River, and on the Ohio R. and the Baltimore & O. R.R.'s; about 12 miles south of Wheeling. It is situated on a point of land, about a mile wide, at the confluence of the Big and the Little Grave creeks. It was once called Grave Creek, and at first there were two small villages called Elizabethtown and Moundsville. The present name is on account of the Mammoth Mound nearby, one of the largest ancient mounds in the United States. In the vicinity are other mounds classed as the Grave Creek group of mounds. The Mammoth Mound is connected with a series of earthworks of ancient construction, and is 820 feet in circumference, at the base, and 63 feet in diameter at the summit. It is about 70 feet in height. In the chambers have been found shell beads, ornaments made of mica, others carved in stone, copper bracelets, and other ancient articles.

Moundsville is in an agricultural and coal region and the industries are connected with farming and coal mining. Pop. (1890) 2,688; (1900) 5,362.

Mounet-Sully, moo-nā-sū-lē, stage name of Jean Sully Mounet, French actor: b. Bergerac,

Dordogne, 27 Feb. 1841. He began his studies at the Conservatoire, Paris, in 1862 and appeared first on the boards of the Odéon; but his theatrical career was interrupted by the Franco-Prussian war through which he served. In 1874 he joined the company of the Théâtre Française, where he gained his reputation as a tragedian of the highest order. His 'Achille' and 'Hippolyte' are powerful and most affecting impersonations, and he is equally successful in Shakespearean roles and the modern dramas of Victor Hugo.

Mount, William Sidney, American painter b. Setauket, Long Island, 26 Nov. 1807; d. there 19 Nov. 1868. He studied at the National Academy, N. Y., and became a member in 1832. His power as a genre painter was first proved by 'Corn Husking' although he had aroused interest by his 'Raising of the Daughter of Jairus' (1828) and a number of striking portraits, including a full-length of Bishop Onderdonk. He may be looked upon as the founder of the American school of genre, and is particularly happy in his treatment of negro characteristics. He has a genuine sense of humor and his 'Bargaining for a Horse' (New York Historical Society); 'Raffling a Goose' (Metropolitan Museum); 'A Long Story' (Corcoran Gallery, Washington) are real pictures of American life.

Mount Auburn, a celebrated burial-place in Cambridge, Mass., covering over 100 acres. Here are the graves of Longfellow, Lowell, Sumner, and other well-known men.

Mount Ayr, Ia., town, county-seat of Ringgold County; on the Chicago, Burlington & Quincy railroad; about 70 miles south by west of Des Moines. It is in an agricultural and stock-raising region, and its industries are chiefly connected with the farm products. The principal buildings are the court-house, churches, and the schools. Pop. (1890) 1,265; (1900) 1,729.

Mount Carmel, Ill., city, county-seat of Wabash County; on the Wabash River, and on the Cleveland, Cincinnati, Chicago & Saint Louis railroad; about 145 miles southeast of Springfield. The place was settled in 1818 and in 1868 was chartered. It is in an agricultural section; but the good water-power has contributed toward making it a manufacturing city. The chief manufactures are flour, paper, lumber, furniture, lumber products, strawboard, machinery supplies, shafting, pulleys, and dairy products. It has the railroad shops of the 'Big Four' railroad. There is considerable trade in manufactured articles, farm products, and live-stock. Pop. (1890) 3,376; (1900) 4,311.

Mount Carmel, Pa., borough in Northumberland County; on the Northern C., the Philadelphia & R., and the Lehigh V. R.R.'s; about 45 miles north by east from Harrisburg. It is in a mountainous region in the midst of valuable coal fields, and nearby are a number of large anthracite mines. The manufactures are mining implements, miners' lamps, hats, caps, men's clothing, flour, and cigars. The borough has an extensive trade in lumber and coal. Pop. (1890) 8,254; (1900) 13,179.

Mount Carroll, Ill., city, county-seat of Carroll County; on the Chicago, Milwaukee & Saint Paul railroad; about 25 miles southwest

MOUNT CLEMENS—MOUNT FOREST

of Freeport and 10 miles east of the Mississippi River. It is situated in an agricultural and stock-raising region, and in the vicinity are deposits of iron ore. It is the seat of the Frances Shimer Academy, and it has a high school and a high school library. Pop. (1890) 1,836; (1900) 1,965.

Mount Clemens, Mich., city, county-seat of Macomb County; on the Clinton River, and on the Grand Trunk railroad; about 22 miles northeast of Detroit. Electric railroad lines connect the city with Detroit and the towns along the coast. The first settlement was made in 1802; and the original plan of the village was made in 1818 by Christian Clemens. This first plat consisted of 60 lots now in the business centre of the city. The coopers business was most important in the early days; the staves and heads for oil casks and barrels being made in Mount Clemens and shipped to large oil firms in New Bedford, Mass. Then Mount Clemens was considered the most important place in Michigan; but with the decay of whaling and the whale-oil industries, the coopers business declined and the town was at a standstill for several years. In 1865 a company prospecting for oil sank a well at Mount Clemens. After going to a depth of about 1,300 feet they abandoned all hope of oil, but found salt instead. Soon a new company was formed for the purpose of manufacturing salt, but the enterprise did not prove a success because of the quality of the salt. In 1868, apparently by accident, the discovery was made that the water from the salt wells possessed remarkable medicinal properties and since then the place has had a steady growth which is increasing each year. Large sanatoriums, hotels, and bathing places have been built to accommodate the thousands of people who annually visit the place seeking health. The mineral waters, classed as sulpho-iodo-chromo-salines, as they come from the wells are about 50° F., and very rich in mineral salts, chiefly chloride of sodium and chloride of magnesium. About 30 different chemical ingredients constitute their make up. Each bath, 65 gallons, contains 120 pounds of mineral salts in solution; also sulphuretted hydrogen gas and carbonic acid gas. The wells range in depth from 800 to 1,200 feet. Each large bath house has its own well. By means of the modern pumping system the water is brought to the surface and stored in large tanks. Pipes carry this water to boilers where it is heated as ordered by the physicians and then carried by other pipes to the bath houses. The Mount Clemens mineral waters have become famous for their efficacy in rheumatism, gout, skin troubles, catarrhal conditions, diseases of women, nervous disorders, auto-intoxication, neurasthenia, etc. Physiologically they act by absorption principally. The water during a bath is carried into the blood and lymphatic system through the skin. In this wise it rids the system of all impurities and toxic agents incident to the various different ailments; at the same time a certain stimulus is maintained to the nervous system. The beautiful residences, broad, well-kept streets and grounds, the long lines of shade trees, the parks, the drives, all make the place most attractive. Gratiot Avenue is virtually a continuation of the avenue of the same name in Detroit. Both avenues are parts of what was once the govern-

ment road made in 1840 and extending from the fort in Detroit to the fort at Port Huron. The churches and schools compare favorably with others in the State. Mount Clemens has considerable manufacturing and commercial interests. Some of the manufacturing establishments of the city are a carriage and wagon factory, beet-sugar factory, machine-shops, and cooperage works. The government of the city is administered under the law of the State for the cities of the fourth class. Pop. (1890) 4,748; (1900) 6,576.
DR. RICHARD LEURCHNER.

Mount Cook, or Aorangi, New Zealand.
See COOK, MOUNT.

Mount Desert, dē-zert' or dēz'ért, an island off the coast of Maine, the largest belonging to the State, part of Hancock County. It is separated from the mainland by Western Bay, Mount Desert Narrows, and Frenchman's Bay. It is about 15 miles long and eight miles wide; area, about 100 square miles. The coastline is very irregular; the chief indentations are on the north, Eastern Bay; on the south, Somes Sound, a fiord which extends into the centre of the island, and Southwest Harbor and Blue Hill Bay. On the west is Seal Cove and Western Bay. Bartlett's Narrows on the west separates Bartlett and Mount Desert Islands. On the south Cranberry Passage separates Great Cranberry Island from Mount Desert. The irregularity and nature of the coast-line, and the separation of the island from the mainland is due to submergence of the land and weathering. The surface is mountainous, along the northern coast is a line of rugged cliffs, and Green Mount, in the interior, is over 1,500 feet in height. Several fresh-water lakes beautify the island and add to its attractiveness. Long Pond, Eagle Lake, Jordan's Pond, Echo Lake, and Seal Cove Pond are the principal bodies of water lying wholly within the interior.

The principal harbors are Bar Harbor, Southwest and Northeast harbors. The island is a favorite summer resort; the most popular place is Bar Harbor. In Frenchman's Bay are five rocky islands called the Porcupines, and about 20 miles south, in the open ocean, is Mount Desert rock, on which is built a lighthouse.

The first authentic account of this island was given by Champlain (q.v.), who gave it the present name. In 1608 M. De la Saussaye, and the Jesuit Fathers Lallemand, Masse, Quentin, and Biard, together with 25 colonists from France, established on Somes Sound a colony which they called Saint Sauveur. Eight years later the colony was destroyed by a party of Englishmen from Virginia. The first permanent settlement was made by Abraham Somes, who in 1761, built a house at the head of the sound which still bears his name. The town of Mount Desert was incorporated in 1789; Eden, in 1796; Cranberry Isles, in 1830, and Tremont, in 1848. The population of the towns as given by the Federal census of 1900 is as follows: Mount Desert, 1,600; Eden, 4,379; Cranberry Isles, 374; Tremont, 2,010.

Consult Fairfax, 'At Mount Desert.'

Mount Etna. See ETNA, MOUNT.

Mount Everest. See EVEREST, MOUNT.

Mount Forest, Canada, a town in Wellington County, Ontario, on the south branch of

MOUNT GILEAD—MOUNT SAINT ELIAS

the Saugeen River, and on the Toronto, Grey & Bruce railroad, connecting with the Canadian Pacific and Grand Trunk R.R.'s. Its industrial establishments include flour, grist, saw, and woolen mills, and it has manufactures of iron, agricultural implements, leather, pottery, and bricks. Pop. (1901) 2,019.

Mount Gil'ead, Ohio, village, county-seat of Morrow County; on the Whetstone River, and on the Cleveland, C., C. & St. L. and the Toledo & O. C. R.R.'s; about 40 miles north by east of Columbus. It has considerable trade in farm and dairy products, and it is a distributing centre for quite a section of the county. Pop. (1890) 1,329; (1900) 1,528.

Mount Holly, N. J., town, county-seat of Burlington County; on Rancocas Creek, and on the Pennsylvania Railroad; about 15 miles east of Philadelphia. It is in an agricultural section, but its industries are chiefly manufacturing. The industrial establishments are foundries, large shoe factories, a hammock factory, machine-shops, and canneries. It has the Children's Home, the Burlington County Hospital, and the Burlington County Lyceum of History and Natural Science, founded in 1870. The library connected with the lyceum contains about 7,000 volumes. Some of the other prominent buildings are the churches, schools, and county buildings. Pop. (1890) 5,376; (1900) 5,168.

Mount Holyoke (hōl'yōk) College, a college for women at South Hadley, Mass. It was founded by Mary Lyon (q.v.); chartered in 1836 and opened in 1837 under the name of Mount Holyoke Female Seminary. From the first it has had a reputation for thorough scholarship; the curriculum was gradually enlarged and the entrance requirements raised until a full college course was given and the old seminary course entirely superseded. In 1888 the name was changed to Mount Holyoke Seminary and College, and in 1893 to Mount Holyoke College. Formerly three degrees were given, A.B., B.S., and B.L.; but A.B. is now the only degree conferred. The course is arranged in two years of required and two years of elective work; the curriculum includes pedagogy, biblical history and literature, and music and art; a limited amount of technical work in the latter courses may count toward the degree. Provision is also made for graduate work leading to the degree of A.M., and for special work for school teachers. Graduates are entitled to fellowships in the American School of Classical Studies at Athens, and in the similar school at Rome; also to the advantages of the Zoological Station at Naples and the Marine Biological Station at Wood's Holl, Mass. Entrance to the college is by examination or certificate from approved schools. The campus now includes about 150 acres; the principal buildings are Mary Lyon Hall, which occupies the site of the original building destroyed by fire in 1806, the Dwight Memorial Art Building, Lydia Shattuck Hall for the physics and chemistry departments, the Lyman Winston Hall for the other sciences, the observatory, the gymnasium, the residence halls (seven in 1903), and the library which contained in 1903, 35,000 volumes; there are also plant houses and botanical gardens. It was a feature of the founder's plan that a considerable part of the domestic work should be done by the students, each student giving an hour a day to

such work; the time required was gradually reduced to half an hour; students are still allowed (1904) to assist in doing the housework; the lighter part being entirely done by them. It has become a custom also to give to students a part of the clerical and some laboratory work instead of housework. Full attention is given to physical training; regular gymnasium work is required for the first three years of the course, and there is provision for polo, basket ball, tennis and golf. In 1903, the productive funds of the college amounted to \$568,000, the income for the year was \$308,378; the students numbered 671, the faculty 58, and the total number of graduates, 3,031.

Mount of Olives. See OLIVES, MOUNT OF.

Mount Pleasant, Iowa, city, county-seat of Henry County; on the Saint Louis, K. & N. and the Chicago, B. & Q. R.R.'s; about 120 miles east by south of Des Moines and about 28 miles west of the Mississippi River. It is in an agricultural region in which considerable attention is given to raising horses and live-stock. Large limestone quarries are in the vicinity. It was settled in 1834 by Pressley Saunders; incorporated in 1838, and chartered in 1851. The chief industrial establishments are flour and lumber mills, brick yards, potteries, wagon and carriage factories, grain elevators, and machine shops. It has considerable trade in grain, limestone, horses, and live-stock. It is the seat of the Iowa Wesleyan University (M.E.), founded in 1844, the German Theological College (M.E.), founded in 1873, and Hone's Academy. It has 13 churches, a conservatory of music, a high school, public and parish schools, and a Carnegie free public library. The State Hospital for the Insane is located here. The three banks have a combined capital of \$250,000. The government is vested in a mayor and council of eight members, all of whom hold office two years. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,997; (1900) 4,109.

CHAS. G. ROGERS,
Editor 'News.'

Mount Pleasant, Mich., city, county-seat of Isabella County; on the Chippewa River; and on the Pere M. and the Ann A. R.R.'s; about 70 miles north by west of Lansing. It is in an agricultural and lumbering region, but the city has considerable manufacturing. The principal industrial establishments are brick and tile works, wagon and carriage factories, lumber and flour mills, foundry, machine-shops, woolen-goods factory, and furniture works. A Government Indian School and the Central State Normal School are in this city. Pop. (1890) 2,701; (1900) 3,662.

Mount Pleasant, Pa., borough in Westmoreland County; on the Pennsylvania and the Baltimore & O. R.R.'s; about 25 miles southeast of Pittsburg. It is in a region of good farm lands and extensive coal fields. The chief manufactures are iron, glass, flour, foundry products, lumber, coke, and dairy products. The Western Pennsylvania Classical and Scientific Institute, under the auspices of the Baptists, is located here. Pop. (1890) 3,652; (1900) 4,745.

Mount Saint Elias. See SAINT ELIAS, MOUNT.

MOUNT SAINT MARY'S COLLEGE—MOUNT VERNON

Mount Saint Mary's College, a Roman Catholic school in Emmitsburg, Md., founded in 1808. In 1903 there were connected with the school 49 professors and instructors and 216 students. There were nearly 30,000 volumes in the library, and the buildings and grounds were valued at \$190,000. The courses lead to the degree of A.B. The Theological Seminary connected with the college was also founded in 1808, and in 1902 had an attendance of 50 pupils. Both schools are in charge of the secular clergy.

Mount-Stephen, George Stephen, BARON, Canadian financier: b. Dufftown, Banffshire, Scotland, 5 June 1829. He removed to Canada in 1850 where he engaged in mercantile business and became wealthy. He was afterward president of the Bank of Montreal and was conspicuous in promoting the completion of the Canadian Pacific Railway for which service he was knighted by the queen in 1886. He returned in 1888 to England and in 1891 was created Baron Mount-Stephen.

Mount Sterling, Ill., town, county-seat of Brown County; on the Wabash railroad; about 70 miles west by north from Springfield. A fertile agricultural region surrounds the town, and coal and clay deposits are in the vicinity. The chief manufactures are tile, brick, flour, wagons, and dairy products. The town owns and operates the waterworks. Pop. (1890) 1,655; (1900) 1,960.

Mount Sterling, Ky., city, county-seat of Montgomery County; on the Chesapeake & Ohio railroad; about 31 miles east of Lexington. It is in an agricultural region, and has considerable manufacturing. Its chief industrial establishments are flour and planing mills, a distillery, machine-shops, and furniture works. It has several private schools, good public schools and a public library. Pop. (1890) 3,629; (1900) 3,561.

Mount Union College, in Alliance, Ohio, coeducational, founded in 1846 under the auspices of the Methodist Episcopal Church. Its courses lead to the degrees of A.B., B.S., Ph.D., and B.L. In 1903 there were connected with the school, 20 professors and instructors and 550 students. Short summer courses are provided for the long vacation. The number of volumes in the library was about 7,000. The grounds and buildings were valued at \$192,000, the scientific apparatus, machinery, and furniture at \$82,500; the productive fund amounted to \$180,000, and the income from productive fund, tuitions, and other sources, \$20,000. In 1901 the benefactions were \$8,000.

Mount Vernon, the estate of George Washington, in Fairfax County, Va., on the right bank of the Potomac, 15 miles below Washington, D. C. The original name of the estate was Hunting Creek, and it contained about 800 acres. When it came into possession of Lawrence Washington, the brother of George, he changed the name to Mount Vernon, in honor of Admiral Vernon of the British Navy. The house is of wood, erected on a bluff 200 feet above the river. It is a two-story house, 96 feet long and 30 feet deep. The main part was built by Lawrence Washington in 1743 and the wings were added by George Washington; the estate came into possession of George Wash-

ington in 1752 after the death of his brother. In 1859 the house and 200 acres of land around it was bought by the Mount Vernon Ladies' Association; the purchase money was \$200,000, raised in great part by Edward Everett. Since then the Association has restored the house as nearly as possible to what it was in the life time of George Washington. A high piazza extends along the front of the house, and the six rooms on the ground floor contain many objects of historical interest connected with the life and times of Washington. The key of the French Bastille, the furniture used by the family, in the piazza the tiles which were brought from the Isle of Wight, and many other relics are objects of attraction to visitors. In the garden are a number of trees planted by Washington, and in the coach-house is his carriage. The room at the south end of the first floor is the one in which Washington died. In 1831 the body of Washington was removed from the old family vault to a tomb, a plain brick structure, which is near a wooded ravine, a short distance from the house. Behind an iron grating may be seen the two sarcophagi which contain the remains of George Washington and his wife, Martha.

The estate was willed by George Washington to Bushrod Washington, and at the death of the latter it came into possession of John A. Washington, from whom the Ladies' Association purchased the house and adjacent grounds. Consult: Lossing, 'The Home of Washington'; Wineberger, 'Home of Washington at Mount Vernon.'

Mount Ver'non, Ill., city, county-seat of Jefferson County; on the Southern, the Wabash, Chester & W., the Chicago & E., and the Louisville & N. R.R.'s; about 115 miles south by east of Springfield. The place was laid out for a city in 1819 and in 1872 was incorporated. It is in a fertile agricultural region, and in the vicinity are extensive deposits of bituminous coal. The chief manufactures are machine-shop products, flour, lumber, cars, axe handles, dairy products, and dressed marble. It has large coal yards, a grain elevator, and brick yards. It has considerable trade in grain, coal, and live-stock. The principal buildings are the Supreme Court building, the county buildings, the churches, and schools. According to the provisions of the original charter, the government is vested in a mayor, who holds office two years, and a council. Pop. (1890) 3,233; (1900) 5,216.

Mount Vernon, Ind., city, county-seat of Posey County; on the Ohio River, and on the Evansville & T. H. and the Louisville & N. R.R.'s. It is in a rich agricultural region; the industries are largely connected with the farm products. Coal is found in the near vicinity. It was settled in 1812 by a Dutch colony from Pennsylvania. The place was incorporated in 1830, and in 1853 was chartered as a city. The principal manufacturing establishments are flour mills, hominy mills, brick yards, strawboard works, machine-shop products, lumber and lumber products. The educational interests are provided for by good public and parish schools and a fine library. The Carnegie Library building will be ready for use in 1904. There are seven churches and a fine court-house. The two banks have a combined capital of \$100,000, and the annual business is about \$1,000,000. The

MOUNT VERNON—MOUNTAIN CLIMBING

government is vested in a mayor and a council of eight members, each of whom holds office two years. Pop. (1890) 4,705; (1900) 5,132.

Mount Vernon, Iowa, town in Linn County; on the Chicago & Northwestern railroad; about 65 miles west of Clinton. It is situated in a rich farming region and its manufacturing and commercial interests are connected largely with the products of the farms. It is the seat of Cornell College (M.E.), established in 1857. Pop. (1890) 1,259; (1900) 1,629.

Mount Vernon, N. Y., city in Westchester County; on the Bronx River and Hutchinson River, an arm of Pelham Bay, and on the New York, N. H. & H., and the New York C. & H. R.R.'s; adjoining New York city on the north, and about 13 miles from the Grand Central Station in New York. Electric lines connect Mount Vernon with New Rochelle, Yonkers, and a number of the villages and cities in the vicinity. Rapid transit lines from New York city extend almost to Mount Vernon (1903) and the present plans provide for the extension of the lines into the heart of the city.

Mount Vernon is really a residential suburb of New York; a large part of the city is restricted for residential purposes. It was founded in 1852 and in 1892 was chartered. It has several industrial establishments and considerable trade, chiefly in the products of market-gardens and as a distributing centre for the nearby sections of county. The Westchester Lighting Company is located here. It has about 1,000 employees, and furnishes for many places in Westchester County, light, power, and heat for public and private uses. The streets and avenues are well paved and well-kept. The handsome lawns and gardens and the great number of shade trees make the city most attractive. Some of the prominent buildings are the Mount Vernon Hospital, the Lucas Building, a post-office, fine church and school buildings. It has a public library founded in 1896, and the building donated by Andrew Carnegie, at a cost of \$50,000, was begun in 1903.

The water, electric-light, and sewer systems are all well organized and are being improved and extended to meet the needs of a growing city. The government is administered under the original charter, which provides for a mayor who holds office two years, and a council. The mayor appoints, subject to approval by the council, all the administrative officers except the board of education, comptroller, assessors, and receiver of taxes, who are elected by the people. Pop. (1890) 10,830; (1900) 21,228.

Mount Vernon, Ohio, city, county-seat of Knox County; on the Kokosing River, and on the Cleveland, A. & C., and the Baltimore & O. R.R.'s; about 40 miles northeast of Columbus and 85 miles southwest of Cleveland. It is in an agricultural region and near the natural gas belt. The chief industrial establishments are a foundry, the Corliss engine-works, flour and lumber mills, locomotive works, furniture factory, cooperage, sash and door factory, bentwood works, and bridge works. It has considerable trade in manufactured articles and in farm and dairy products. The Hiawatha Park, the court-house, the library, and fine church and school buildings, all contribute to the attractive features of the place. The city owns

and operates the waterworks. Pop. (1890) 6,017; (1900) 6,633.

Mount Washington. See WASHINGTON, MOUNT.

Mountain Ash, Wales, a coal and iron-mining town of Glamorgan, four miles southeast of Aberdare. The principal buildings comprise the parish church of St. Margaret, the Workman's Hall, a library and reading-room, etc. Pop. (1901) 31,093.

Mountain Ash, Quicken Tree, or Rowan Tree, popular names for a small European tree (*Sorbus aucuparia*) of the order *Rosaceae*, and, by extension, for two American species. The European species is an erect, graceful tree about 30 feet tall; bears ash-like, odd-pinnate leaves; corymbs of small yellowish-white flowers followed by globular orange colored acid fruits (pomes). It is frequently planted for ornament and seems to thrive upon any soil except that which is very heavy or very light, or poorly drained. It does well in the cold north beyond the range of most fruit trees, and there the fruits are often made into preserves. The hard, compact wood is used for turning, cabinet work, etc. In Europe its twigs are highly prized by the superstitious as charms and as guardians against evil spirits.

The American species (*S. americana*), which resembles the preceding, ranges from Labrador to the mountains of North Carolina and from there irregularly northwestward to Manitoba. With the exception of its wood, which is light and inferior, it is used like the first species. The elder-leaved species (*S. sambucifolia*) ranges from Pennsylvania, Michigan and California to Greenland and Alaska and extends in eastern Asia as far south as Japan. It is much smaller than the previous species and is much more variable. Its flowers and fruits are larger and its leaves are more like those of the elder. In the southern part of its range it is only occasional; in the northern, common.

Mountain Beaver. See SEWELLE.

Mountain Blacksnake, Mocking-bird, Plover, Sheep, etc. See BLACKSNAKE, MOCKING-BIRD, PLOVER, SHEEP, etc.

Mountain Climbing, a modern adventure-some amusement, which in the 20th century may be classified as a species of sport. It is true that hardy adventurers found their way to the summits of mountains as early as the 18th century, when in 1787, Balmat ascended Mont Blanc, but the systematic and scientific climbing of mountains had its growth from the formation in 1857 of the first Alpine Club in London, which was organized to enlarge "the community of feeling among those who in the life of the High Alps have shared the same enjoyments, the same labors, and the same dangers."

Alpine Clubs.—Alpine clubs and mountain-climbing societies have since been organized in nearly all continental countries, and at least four such organizations exist in the United States, the American Alpine Club of Philadelphia, organized in 1902; the Appalachian Mountain Club of Boston, organized in 1876; the Manzanitas Club, of Portland, Ore., organized in 1894, and the Sierra Club, of San Francisco, organized in 1892. These four associations have a combined membership of over 300. The Euro-

Copyright, 1900, by Detroit Photographic Co.

MOUNT VERNON.

MOUNTAIN-CURE — MOUNTAIN MEADOWS MASSACRE

pean clubs and societies have an aggregate membership of over 185,000; the German clubs having 56,000, Italian, 54,000; French, 6,000; and Swiss, 7,000.

Climbing Records.—The records of mountain climbers cover all nationalities and various years from Balmat (1787) to Outram (1902). The highest point thus far climbed in foreign lands was in the Himalayas in 1883, by W. W. Graham, who reached a height of 24,015 feet. In North America, the Duke of Abruzzi and his party reached a height of 18,100 feet on Mount Saint Elias in 1897. In South America, S. Vines climbed 23,393 feet in the Andes in the same year. The highest summit (15,217 feet) was reached by Smythe and party in the Swiss Alps in 1855. In 1898, Mrs. Workman accompanied her husband, Dr. W. H. Workman to the summit of Koser Gunge in the Himalayas, a height of 21,010 feet. Mount Washington, in the White Mountains, has been climbed to an altitude of 6,293 feet, while Pike's Peak, in the Rocky Mountains, has been reached to the 14,147 mark.

Accidents.—In the Alpine countries, thousands of Swiss, Italians and Tyrolese have become professional guides, and their skill exceeds that of the most scientific of learned Alpine club members. Hundreds of lives among both visitors and guides have been lost in the Alps, but this fact does not appear to deter thousands of others from making perilous ascents each year. Accidents in mountain climbing rarely occur when guides are taken and the party is properly roped together. Occasionally a foothold seemingly secure gives way; but more frequently the fall occurs because the climber is overtired, or has started too quickly, without the necessary training. Over-exertion of either body or mind is always to be avoided. The use of the alpenstock and the ice-axe in mountain climbing, as well as general directions for making an ascent and descent, are fully set forth in a manual prepared under the auspices of the London Alpine Club, entitled 'Dent's Mountaineering,' which was published in the Badminton Library in 1892.

Bibliography.—Ball, 'Peaks, Passes and Glaciers' (1862); Collie, 'Climbing in the Himalayas' (1880); Conway, 'The Alps from End to End' (1895); Dent, 'Above the Snow-line' (1885); Fitzgerald, 'Climbs in the New Zealand Alps' (1896); Forbes, 'Travels Through the Alps' (1843); King, 'Mountaineering in the Sierra Nevada' (1886); Mathews, 'The Annals of Mont Blanc and the Matterhorn' (1808); Stephen, 'The Playground of Europe' (1871); Wilcox, 'Camping in the Canadian Rockies' (1900); Workman, 'The Ice World of the Himalaya' (1898).

Mountain-cure, a graduated system of mountain or hill climbing now advocated in certain quarters for the strengthening of the heart and the body generally, especially in valvular disease and fatty infiltration of the heart. While in certain cases it may be useful, it should not be attempted except under medical direction.

Mountain Ebony. See BAUHINIA.

Mountain-fever, or Mountain-sickness. The term mountain-fever was applied formerly to a fever accompanied by debility, diarrhea, etc., which occurred quite frequently (and now occurs occasionally) in the mountains, especially those

in the western part of the United States. It is now generally conceded that this form of fever is essentially typhoid, modified by the effects of extreme altitude. The term mountain-sickness (sometimes used synonymously with mountain-fever), means a condition produced by the action of rarefied air upon organic functions, especially in persons who exercise considerably. The intake of oxygen is diminished in high altitudes; the pulse is quickened, and the body-temperature raised to 100°-101° F. Difficulty in breathing, headache, vertigo, nausea, and vomiting are likely to occur. Hæmoptysis is rare. Rest and acclimatization are the remedies.

Mountain Goat. See ROCKY MOUNTAIN GOAT.

Mountain Laurel, or American Laurel, a shrub of the genus *Kalmia* of the order *Ericaceæ*. The few species which are natives of North America and Cuba are mostly shrubby, evergreen, and highly ornamental, especially when in flower, the blossoms being usually in terminal corymbs or axillary umbels, individually of medium size, white, pink or purple. On account of their beauty and hardness most of the species are very popular for planting in parks and private grounds even in the northern States and southern Canada. They do well in ordinary garden soil if not too clayey, but thrive best in peaty or sandy soil, particularly in partial shade. They require plenty of moisture and will do well even in marshy soil. The best known species is probably *K. latifolia*, most frequently known by the above names and also as calico-bush and rhododendron. It ranges from New Brunswick to Ohio and southward to Florida. Sheep-laurel (*K. angustifolia*), also known as wicky and lambkill, extends from Labrador southward to Georgia. These two species are the most conspicuous flowers in the Alleghany Mountains during the early summer. *K. polifolia*, also found in the East, is common in the Rocky Mountain region from Alaska to California. The deciduous species *K. hirsuta* and *cuneata* range southward from North Carolina. They are less planted in the north than the first two species.

Mountain Limestone, a term commonly used in England of the stratum in southern England and Wales at the base of the sub-carboniferous deposits. The phrase was also used for a time of the limestones of American plains, but has now been dropped. It contains many fossils, especially encrinurites and some important fossil fish. Its commercial value, apart from its being a bearer of lead and zinc ores, lies in its use as building stone, since it is capable of a high polish, and for the preparation of lime.

Mountain Lion. See COUGAR.

Mountain Mahogany, the sweet or black birch. See BIRCH.

Mountain Meadows Massacre, in American history, a massacre of Western emigrants, near Mountain Meadows, Utah, in September 1857. The emigrants numbering 140 souls were on the way from Arkansas and Missouri to Southern California. While in camp in the valley of Mountain Meadows, in Zion County, they were attacked by Indians and it is alleged by Mormons disguised as Indians. They held their ground for three days, when under promise of protection by John D. Lee (q.v.), a Mormon

MOUNTAIN TEA — MOUNTAINS

bishop and Indian agent, they left their barricade of wagons; whereupon the attack was renewed and every person of the 140 slaughtered excepting 17 young children. These were distributed among Mormon families but were afterward restored to their relatives by the United States Government. The Mormons have always been blamed for the massacre. Consult Linn, 'Story of the Mormons' (1902).

Mountain Tea. See GAULTHERIA.

Mountains. A high elevation of land is called a mountain; a low elevation, a hill. The application of the term "mountain" varies in different localities. In the lowlands, where the elevations are not numerous, and do not reach a great height, a rise of ground of about 100 or 200 feet is called a mountain; while in a mountainous country an elevation of 1,000 feet, or less than 2,000 feet, is called a hill. Prominent parts of mountains or isolated mountains are called *peaks*. Some of the common names applied to the parts of a peak, or mountain, are summit, base, slope, crest, pinnacle, needle, knob. A series of connected mountains form a *ridge*, *range*, or *chain*; if the mountains extend a considerable length, the whole is called a range or chain; if short, a ridge. A group of parallel ridges or ranges, or of ridges or ranges near together, usually resultants from similar causes, is called a mountain *system*; and several systems combined form a *cordillera*. An elevation with a level-topped area of considerable extent, is called a plateau and is usually associated with mountains. Many of the highest mountains of the world rise thousands of feet above the basal platform of the plateau. The *mesa* is a large level-topped section of the plateau; the *butte* is a small level-topped section. Valleys, lower land than plateaus, exist between the ridges, ranges, or systems. A wide valley is often an *interior basin*. The interior basin area of Australia is over 51 per cent of the whole area; of Africa, 31 per cent; of North America, 32 per cent, and of Eurasia, 28 per cent. (See GREAT BASIN; VALLEYS.) Low, narrow places in mountain ridges and chains are called *passes*. The depressions among the mountains contribute in a great measure to a solution of the causes which have determined the kind and location of the vast elevated land masses of the earth.

The most prominent and the greatest number of mountains in the world are formed by the (1) folding of the earth's crust. These folds are broken into ridges and chains, and are modified by another cause for mountains in their present form; (2) denudation or the destructive action of the elements; (3) and still another cause for mountains as they exist is eruptive action. Various theories have been advanced regarding the causes of the mountain folds, the arrangement of the rocks along certain lines, and while it is generally accepted that heat has had much to do with the present condition of the earth's surface, yet so little is known of the interior of the earth that no theory yet advanced can as a whole be accepted. If it is true that the heat is passing from earth into space, then contraction will explain many of the peculiar mountain forms of the world. The changes now taking place in the Japanese Islands and the coast ranges along the Pacific, would seem to contribute corroborative evidence, if not positive proof, in favor of the contraction theory. No

convulsions except volcanic are now taking place, but the changes of centuries seem to be made by a slow folding process. Whatever may be the cause which makes the uplift on the earth's surface, denudation begins as soon as the peak appears, and formation and destruction are conjoint agents in making the mountains what they are on the surface of the earth. Before the process of folding is completed the elements have begun their work of shaping and sculpturing, but the destructive agents at first work more slowly than the constructive. The chief agents of changes after formation are wind and water. The position of a mountain gives some idea of its rock structure, and its rock structure and form tell something of its age. The presence of hard rock in a mountain is often shown by the upright peak whose faces may be comparatively bare, but which points up, resisting wind and water. Pike's Peak is granite rock. The White Mountains, N. H., have many hard rocky peaks; the Matterhorn, in the Alps, is a hard crystalline rock, and some of the Alaska peaks are examples of almost unyielding formations that appear to defy the ages. Remarkable examples of the sculpturing of the mountains by water are shown in the gorges in the Rocky Mountains, the rugged slopes, and combined with the wind, the etchings on the rocks; the removal of soft layers leave the hard rocks standing like gigantic castellated ruins as on the slopes of the Rockies. The high, sharp pointed peak and the irregular rugged surface indicate that the mountains are not among the oldest of the earth. The Adirondacks, with their low, rounded tops, their comparatively uniform slopes, show that long periods have passed since their formation; erosion and weathering have removed much of the ruggedness and sharp angularities that once existed. Along the Atlantic coast east of the Appalachian Mountains the low round hills are remnants of what were once high mountains.

Mountains formed by eruptive processes are volcanic and may be divided into three groups: (1) active, (2) dormant, or (3) extinct. There are vast regions in which there was once volcanic action but where now no volcanoes exist; as the east coast of the United States, the central part of France, part of the eastern Rocky Mountain section, the British Isles, and other places. The Mississippi Valley has a large area that possesses no indications of ever having had volcanoes. The plateau of Deccan has an area of 200,000 square miles covered with lava. The lava covering portions of the Snake River Valley is of great depth. Volcanoes are located in the vicinity of the oceans and are commonly present in high mountains. Notable exceptions among high mountains are the Alps and Himalayas. The great line of volcanoes extends from the Andes in South America to Alaska, then from the northeastern coast of Asia to the East Indies, around to and including the island of Sumatra. There are now no active volcanoes in the United States except in Alaska, which with Mexico and Central America contains the active volcanoes of North America. In the State of Washington there are volcanic cones so perfect in form that they may be only dormant. There are thousands of cones on the plateaus of the Rocky Mountain system, some almost destroyed, some as if only sleeping.

The most important substances emitted from

MOUNTAINS OF THE MOON—MOURNING

volcanoes are steam, lava, volcanic-ash, or pumice. A *mud flow*, such as destroyed Herculaneum in 79 A.D., is caused by the water from violent thunderstorms falling on the volcanic-ash and washing it down the slope. A lava flow rarely extends more than 30 miles from the crater. The nature of the eruptions differ. The most violent occur in volcanoes that have had the longest periods of rest. (See VESUVIUS.) Krakatoa (q.v.) has had but one eruption in more than a century. The volcano on the Lipari Islands is in action nearly all the time; the eruptions are ash, but vessels passing do not fear danger. The form of the cone depends upon the number and nature of the eruptions. When a volcano has ceased action, the work of denudation soon manifests itself. The soft part is carried down the slope, and the centre or the place where the rock is hardest remains standing, and is called a *neck* or *plug*. These forms exist in large numbers on the western plateau of the United States. (See PELÉE, MOUNT.) There are good reasons for believing that there are many volcanoes beneath the ocean. The volcanic cones which have appeared above water, in modern times, one off the coast of Alaska and one in the Mediterranean, would seem to prove their existence on the ocean bed. A number of the active volcanoes are out of the great volcanic line, and are within the Atlantic Ocean basin. At the opposite ends of the mid-Atlantic ridge are important volcanic formations; at Tristan de Cunha and Iceland, and there are volcanoes on the Canaries, Azores, and in the Mediterranean. Earthquakes (q.v.) seem to have a close relation to volcanoes. The fault line of mountains is as often caused by the earthquake as by the volcano.

The mountains of the world are distributed with remarkable uniformity. The longest and highest ranges of North and South America face the Pacific Ocean, and extend almost due north and south. The longest and highest ranges of Eurasia extend nearly east and west. Starting from the highest plateau in the world, Pamir, in Asia, there are extending west, mountain ranges which are continuous through Europe to the Atlantic, and, also, with but few low depressions along the eastern coast of Africa to Cape of Good Hope. Passing east from the plateau of Pamir are lofty mountain ranges extending to the northeastern part of Asia, then crossing to Alaska, unite with the great ranges which skirt the western coast of the Americas. The highest mountains in the world are the Himalayas; the highest peak, Mount Everest, is fully 29,000 feet high. The mountain peaks of the world whose summits have not been reached (1903) are seven in number, Everest, McKinley, Erebus, Lompobattang, Petermann, Tsiafajavona, and Chydenius.

High mountains exist on the bed of the ocean. A number belonging to the submerged Atlantic continent have been located, and their elevation determined. Some of the most prominent are Mount Chaucer, located in 1850, in latitude 42° 50', longitude 28° 50', crest 284 feet from the surface; Mount Sainthill, in latitude 42° 50', longitude 42° 20', discovered in 1832, height about 11,000 feet. Another important submarine mountain is the Laura Ethel, discovered in 1878, its crest about 216 feet below the surface. A group of submarine mountains, in latitude 43°, longitude 22° 30', has been

named Edward the Seventh Range. Other Atlantic peaks are Tillotston Bright, Placentia, and some in latitude 45° and longitude 48°. Mount Placentia is only about 30 feet below the surface. Many of the islands of the ocean are mensas or buttes.

The mountains of the world are the great depositaries for the world's mineral wealth. The large proportion of the valuable metals in general use in the world have been obtained from the mountains. Mountains affect the climate by protecting from cold winds or by preventing the ocean breezes from cooling the interior of countries in tropical regions, and by controlling in a great measure the rainfall (see CONDENSATION). The flora and the fauna, so dependent upon climate, are modified greatly by the mountains. The elevations are the great water-reservoirs of the world; they store almost the whole supply of water which falls on the earth's solid surface and distribute it in channels throughout the land. Lakes and springs are common in mountains. The vertical land masses of the earth have been most important in determining the history of the world. They are natural boundaries, they have protected the weak from the strong, the civilized from the savage, and many sturdy, powerful races of to-day owe their early preservation in a great degree to the mighty natural barriers which stood between them and a stronger and more ferocious race. The mountains of the world have affected the literature and art of the world, and these influences are still felt wherever a mountain uplifts its crest.

Mountcastle, Clara H., Canadian artist and author: b. Clinton, Ontario, 26 Nov. 1837. Her specialty was landscape and marine views. Under the pen name of "Caris Sima" she has published 'The Mission of Love, and Other Poems' (1882); 'Lost, and Other Poems' (1882); 'A Mystery' (1886), verse; and the novel, 'Crow's Hollow.'

Mounted Police. See POLICE.

Mourning. In most nations from the earliest ages it has been the custom of bereaved persons to testify their grief for the loss of friends or relatives by some external change of dress and deportment. The eastern nations and the Greeks cut off their hair, the Romans allowed the beard and hair to grow, in mourning. Different colors have been adopted as badges of grief; the ancient Egyptians wore yellow; the Ethiopians, gray; the Roman and Spartan women, white, which is still the color of grief in China, Japan, and Siam; in Turkey, blue and violet; and in the other European countries, black is used for this purpose. Some have attempted to trace the associations by which the colors acquired their character to natural causes; but it must be allowed, with little success. The

MOURNING-CLOAK — MOUSE

Jews, in sign of grief at the loss of their relatives, rent their garments, tore out their hair, and wore coarse garments of a dark color; they went barefoot, neglected their persons, and performed other acts of penance. The term of mourning with them was from seven to thirty days. Among the Greeks and Romans it was the custom to lay aside all ornaments of dress, to abstain from the bath, and all indulgences. The kings of France mourned in violet. Among the ancients, as among the moderns, public mournings were common on the death of the sovereign or of a distinguished public benefactor. The period of mourning differs in different countries, but in all is generally regulated by the nearness of relationship between the survivors and the deceased. In Scotch law a widow has a claim to mournings for her husband where his estate or rank requires mourning in point of decency. Mournings for such of the deceased's children as are to be present at the funeral also form a privileged debt. In the United States the customary period of mourning for widows is one year.

Mourning-cloak. A butterfly. See CAMBERWELL BEAUTY.

Mourning-dove. See DOVE.

Mouse, a small rodent mammal of the family *Muridæ*, the larger members of which are called rats, hamsters, lemmings, voles (q.v.), etc.; specifically, the house-mouse (*Mus musculus*), originally Asiatic, but universally domesticated. The family is an extremely large one, embracing some 300 well-established species, and is distributed over the whole world except the islands of the Pacific. A mouse is the only mammal of Australia not a marsupial. The members of this family vary in size from some smaller than a house-mouse to the bigness of the American muskrat (q.v.); and exhibit much diversity in form, especially in respect to the limbs, which in woodland and aquatic species are usually of nearly equal size, but in those that dwell on prairies and deserts are far from it, the hind-legs there becoming immensely enlarged and serving as almost the only means of safety (by leaps), while the fore-legs are of little use except as hands in holding the food. It is a characteristic of mice, as of squirrels, to lift the food to the mouth and gnaw it while the animal sits up on its haunches. The pollex (thumb) on the fore feet is a mere wart-like rudiment; but the hind feet have five full toes, and in some aquatic species these are connected by webs forming swimming feet. The skull is shapely, the nose is long, pointed, hairy, keenly sensitive to odors, and protected by remarkably long tactile hairs (whiskers); the eyes and ears are usually large, for these animals are mainly nocturnal in habits; and the teeth are peculiar in that the lower incisors are compressed and pointed, and the molars (usually three on each side) are rootless. The tail in nearly all rats and mice is long, always thinly haired, often naked or scaly, and in such aquatic species as the muskrat is compressed into a powerful sculling oar. Most species burrow or make their homes in holes; a few are arboreal. The nearest relatives of the group are the dormice, mole-rats, jerboas and pouched rats or gophers, a list which shows that the word "mouse" and "rat," is popularly applied to many small rodents

outside the *Muridæ*. This family is divisible into three sections—*Murina*, or typical Old-World mice; *Arvicolina*, or voles; and *Cricetina*, or hamsters, etc.

The first sub-family contains the various rats (q.v.), the house-mouse, the delicate harvest-mouse and more than 100 other species of Europe and Asia, which agree in having wide upper molars marked by three series of tubercles and in other distinctive peculiarities. The house-mouse has been a denizen of men's habitations probably ever since housekeeping began, finding there safety from many natural enemies, opportunities and materials for nest-making, and plentiful daily food. It accompanies mankind wherever he goes, and soon replaces in frontier houses the local wild mice which for a time attempt to imitate its domestic habits. These mice are about three inches long, the tail measuring $1\frac{1}{2}$ inches more. The general color is bluish or dusky brown, but is subject to variation and influenced by climate, food, and other external conditions. Albino or "white" mice, with pink eyes, are kept as pets, also black and piebald ones; and these breeds are easily maintained by selective breeding. Such pets are readily tamed and taught simple tricks. Certain individuals, known as "singing mice," make, especially at night, a pleasing whistling noise, like feeble chirpings of a canary-bird. The same sound has been heard from wild mice, and is believed to result from an asthmatic condition rather than to be a normal musical utterance. The fecundity of mice is excessive. From six to ten young are produced in a litter, and this species brings forth several times in the year. In about a fortnight the young are able to shift for themselves, although born in a helpless condition. This illustrates how sometimes, under especially favorable conditions, mice may multiply far beyond normal numbers and overrun the country as a devastating plague, instances of which are mentioned under FIELD-MOUSE. The two most common European types, the long-tailed brown field-mouse (*M. sylvaticus*) and the diminutive harvest-mouse (*M. minutus*) are farmers' pests, destroying large quantities of grain. The harvest-mouse is one of the smallest of mammals, and constructs a beautiful and elegant little nest of the blades of grass or corn, entwined round and supported by the stalks of the corn or wheat. A similar smaller species in South Africa weighs only a quarter of an ounce. These out-door species hibernate during winter, and lay up an autumnal store of grain in their nests and burrows—a matter in which great diversity of habit exists elsewhere in the family.

American native mice are all of one or the other of the remaining sub-families, or else do not belong to the *Muridæ* at all. The short-tailed meadow-mice (see FIELD-MOUSE), the neotomas (see WOOD-RAT), lemmings (q.v.), and their allies are elsewhere described. The most of our smaller mice belong to the sub-family *Cricetina*, characterized prominently by having cheek-pouches, and represented in the Old World by the hamsters (q.v.). Five genera and about 75 so-called species have been catalogued, but probably further study will greatly reduce the number. *Oryzomys* is a rather short-tailed, fossorial genus of the plains region and northern Mexico. *Sigmodon* is another

MICE.

4. Jerboas.
5. House Mouse.
6. Brown Rat.

MOUSE-BIRD—MOUTH

genus of Florida and the Southwest, taking its name from the sigmoid form of the cusps of the molars; *Reithrodontomys* embraces several very small burrowing brown mice of the same region; and *Oryzomys* includes the large, handsome "rice-field mouse" of the Southern States (*O. palustris*). The fifth genus, *Peromyscus*, contains the most numerous and familiar of the long-tailed field-mice. These are the "wood-mice," "deer-mice" and "cotton-mice," more familiar under the old name *Hesperomys*, and commonly represented by the white-footed mouse (*P. americanus*, or *H. leucopus*), which occurs all over the more temperate parts of the continent. This species is somewhat larger than the house-mouse, and is yellowish brown above, darker on the back, the lower parts of the body and tail and the upper surface of the feet white; the young are dark slaty; the eyes and ears are large, and the fur long and soft. It is nocturnal in its habits, as active as a squirrel, nesting in trees, in the fields, in barns and houses, and making a dwelling resembling a covered bird's nest; it feeds principally on grain, seeds, nuts, and insects; and in newly settled districts comes into dwellings and granaries and is as mischievous as the house-mouse. Species with similar habits are a beautiful golden-haired southern one (*P. aureolus*); the large, dark-brown, gray-bellied cotton-mouse (*P. gossypinus*), very numerous in the South Atlantic States; the "red-backed" or Michigan mouse (*P. michiganensis*) of the North Central States, and several others.

Consult: Coues and Allen, 'Monograph of the Rodentia' (Washington, 1877); Merriam (and others), 'North American Fauna' (Washington, 1889 and subsequently); Stone and Cram, 'American Animals' (New York, 1902); Ingersoll, 'Wild Life of Orchard and Field' (New York, 1902); and the books of Audubon, Godman, Kennicott, Merriam, De Kay, Baird, Coues, Herrick, and other naturalists.

ERNEST INGERSOLL.

Mouse-bird, or Coly, one of the birds of the African coraciiform family *Coliidae*, which look like big long-tailed timouises, have soft brown and gray plumage, and creep about the branches or hang underneath them, by aid of bill and claw, like the most acrobatic of parrots. The single genus (*Colius*) contains nine species. The toes are all directed forward, but the hallux, and apparently the outer toe also, may be turned backward; hence the peculiar manner of climbing with the whole metatarsus applied to the branch, a fact which adds greatly to the mouse-like appearance. They feed mainly upon fruit, but take some insects; and they lay their eggs in cup-shaped nests placed in low bushes. Consult Evans' 'Birds' (1900), and writers on African ornithology.

Mouse-deer. See CHEVROTAIN.

Mouse-ear, the name of various small plants, suggested by the shape and appearance of the leaves: (1) a borage of the genus *Myosotis*, more generally known in the United States as "forget-me-not" or sometimes "scorpion-grass," small furry herbs, growing in damp and shady places through the temperate regions and bearing clusters of minute blue and white, "yellow-eyed" flowers. (2) The marsh cudweed or wartwort (*Gnaphalium uliginosum*); (see CUD-

WEED). (3) One of the wound-worts (*Stachys germanica*). (4) Any of several chickweeds (q.v.), especially the widely scattered *Cerastium viscosum*.

Mouse-lemurs. See CHIROGALE; LEMUR.

Mouth (oral or buccal cavity), primarily the nearly oval cavity at the commencement of the alimentary canal or digestive tract, into which food is taken, and from which the voice issues. Secondarily the name is applied to the outer orifice of that cavity and to any opening which receives or discharges (in a similar way to the mouth proper) material of various kinds, air, water, gas, etc. Examples are seen in the main opening of a furnace, and that of a fortification, certain openings in wind instruments, the discharging point of a stream, the muzzle of firearms, etc.

Mouth, Diseases of the. The principal diseases of the mouth may be classified as follows: Inflammation of the mucous membrane and its results; epulis; gumboil; ranula; salivary calculus; and salivary fistula.

Inflammation of the Mouth (Stomatitis).—This disorder is usually caused by local irritants, such as scalding drinks, corrosive substances, jagged teeth, or tartar. Suitable remedies are: Cooling and demulcent washes, soft food, building up of the strength, and removal of tartar or other sources of irritation. Inflammation invading the mucous follicles, usually in debilitated children, or from the irritation of teeth, or as the result of an eruption (herpes) is follicular stomatitis. It is attended with thin spots of white exudation, but there is no breach in the surface of the mucous membrane. The patient swallows with difficulty; the mouth is hot and tender; the submaxillary glands may be swollen. The remedies are as above given, with the addition of a disinfectant to the mouth-washes. The terms aphthæ and thrush are applied to a stomatitis, usually follicular, attended by curd-like exudations with ulceration beneath the exudates (ulcerative stomatitis). The disease may be conveyed to the nipples of the nursing woman. In true aphthæ the exudations are due to a microscopic fungus, the *Oidium albicans*. In treatment the child is to be carefully fed, its mouth kept clean and disinfected, and the bowels regulated. Borax, or tincture of myrrh, well diluted, is a good mouth-wash. Do not use honey. Canker refers to isolated superficial ulcerations of the mucous membrane, usually the result of debility and dyspepsia. Remedy these two conditions and touch the spots occasionally with nitrate of silver. Gangrenous stomatitis (noma), or cancrum oris, means a more or less sloughing ulceration, usually upon the gums or cheeks. The breath is fetid; there is great swelling with soreness, high fever, marked debility, etc. It may follow measles or some other debilitating blood-disease. The treatment requires a physician.

Epulis.—This is a smooth round or lobular tumor springing from some portion of the alveolar processes and the periosteum covering them, usually from the lower jaw.

Gumboil.—The gum-disease so named is a circumscribed inflammation of the mucous membrane or of the periosteum covering a portion of an alveolar process, caused usually by a decayed tooth. Wash the mouth frequently with hot

water, have the boil lanced, or cause it to discharge by applications of hot figs (boiled in milk), and have sources of irritation removed.

Ranula.—This term denotes a cystic formation in the mucous membrane beneath the tongue, sometimes originating in the duct of a sub-lingual or submaxillary gland.

Salivary Calculus.—Such is the name given to a concretion, mainly of phosphate of lime, formed in the duct of one of the salivary glands. Sometimes it forms around a foreign body, such as a seed, and sometimes produces a ranula.

Salivary Fistula.—A fistula of this character is an abnormal canal opening upon the cheek, and arising from the duct of the parotid gland as the result of ulceration.

Mouton, moo-tön', Alexander, American politician: b. Bayou Carencro, La., 19 Nov. 1804; d. near Lafayette, La., 12 Feb. 1885. He was graduated from Georgetown College, D. C., and in 1825 was admitted to the bar. He was elected to the State legislature in 1826 and in 1831-2 he was speaker. He was presidential elector in 1828, 1832, and 1836, and was elected to the United States Senate in 1837. He was governor of Louisiana in 1843-6, and later presided over various conventions, but retired to plantation life at the outbreak of the Rebellion in 1861.

Movement-cure. See SWEDISH MOVEMENT CURE.

Moving Plant, an East Indian leguminous plant (*Desmodium gyrans*), remarkable for the motions of its pinnate leaves. The large odd leaflet becomes more or less horizontal under the influence of light and heat, and is depressed during darkness or cold. Besides the movement of rising and falling, it has also a lateral oscillatory motion, so as to occupy an oblique position relative to the leaf-stalk. The smaller leaflets, of which there are one or two pairs, also exhibit jerking movements, approaching and retiring from each other, and these motions proceed to a limited extent during darkness. Gray describes 20 species of *Desmodium* in the flora of the United States, without mentioning that any of them exhibit such movements.

Mowat, mō'ät, Sir Oliver, Canadian statesman: b. Kingston, Ontario, 22 July 1820; d. 1903. He was educated in Kingston and in Toronto and was admitted to the bar in 1841, when he established a law practice in Toronto, and in 1856 was appointed Queen's counsel. He served in the Canada Assembly in 1857-64 and in 1858 was provincial secretary. In 1863-4 he was postmaster-general and in the latter year became vice-chancellor of Ontario. He was appointed premier in 1872 and was also attorney-general until 1896, when he became minister of justice and president of the senate. He was made lieutenant-governor of Ontario in 1897. He was knighted in 1892.

Mowatt, Anna Cora. See RITCHIE, ANNA CORA OGDEN MOWATT.

Mowbray, mō'brā, George W., American inventor: b. Lewes, England, 1815; d. North Adams, Mass., 21 June 1891. He studied chemistry in England, came to America in 1853, worked in the California gold-mines until 1858, in the Pennsylvania oil-country until 1868, and then at North Adams, where he perfected the commercial use of nitroglycerin, and invented

smokeless powder. He was consulting chemist to the Maxim and Nordenfellt Arms Company.

Mowbray, Henry Siddons, American artist: b. Alexandria, Egypt, 1858. He was brought to the United States in early childhood and educated in North Adams, Mass. He studied one year at West Point. In 1878 he entered the studio of Bonnat, Paris, and subsequently settled in New York as a figure painter and decorator. He is a member of the Society of American Artists, and a National Academician. He was awarded the Clark prize by the National Academy in 1888.

Mowbray, J. P., a pseudonym of Andrew Carpenter Wheeler. See WHEELER, A. C.

Mower, mō'ēr, Joseph Anthony, American soldier: b. Woodstock, Vt., 22 Aug. 1827; d. New Orleans 6 Jan. 1870. He was educated in the common schools, enlisted as a private in the Mexican War and in 1855 was commissioned 2d lieutenant. He was promoted captain in 1861 and for bravery in action was made brigadier-general in 1862 and in 1863 commanded a brigade at Vicksburg. In 1864 he was in charge of a division under General Banks in Louisiana and he accompanied General Sherman in his Georgia and Carolina campaigns and received promotion to the rank of major-general. He remained in the army after the war and was in command of the department of Louisiana at his death.

Mowis, in American Indian folk-lore, the bridegroom of snow, who wooed and won a beautiful bride; but when morning dawned, left the wigwam and melted into the sunshine. According to the legend the bride hunted for him night and day in the forests, but never saw him again.

Mowry, mō'rī, William Augustus, American educator and author: b. Uxbridge, Mass., 13 Aug. 1830. He was educated at Brown University and in 1862-3 was a captain in the Federal army. He was principal of the English and Classical school in Providence in 1864-84 and in 1884-5 edited the 'Journal of Education.' In 1886-91 he was editor of 'Education,' and since 1887 has been president of the Martha's Vineyard Summer Institute. He has been intimately connected with various educational boards and has traveled and lectured widely. He has written: 'Nathaniel Mowry and His Descendants' (1878); 'Studies in Civil Government' (1887); 'American Inventions and Inventors' (1900); 'The Territorial Growth of the United States' (1902); etc.

Mox'om, Philip Stafford, American Congregationalist clergyman: b. Markham, Canada, 10 Aug. 1848. During the Civil War he served as "captain's boy" (1862), then enlisted in the Illinois cavalry in 1863, and served till 1865. At the close of the war he entered upon a course of study at Kalamazoo College, Mich., and later studied at Shurtleff College, Ill. (1868-70). Being ordained to the Baptist ministry in 1871, he studied at Rochester Theological Seminary from 1875 to 1878, and was graduated from Rochester University in 1879, with the degree of A.B. From 1879 to 1885 he was pastor of the 1st Baptist Church of Cleveland, Ohio; and from 1885 to 1893 at the 1st Baptist Church of Boston, where he gained a reputation as a preacher of marked power. In 1894

MOYOBAMBA—MOZART

he joined the Congregationalists and became pastor of the South Congregational Church at Springfield, Mass. From 1894 to 1897 he was university preacher at Harvard, and has preached frequently at other universities and colleges. He was at the World's Parliament of Religions, and presented a paper on 'Immortality'; he was also at the World's Peace Congress, and has been delegate to several international peace congresses. He has written 'The Aim of Life' (1894); 'From Jerusalem to Nicæa, the Church in the First Three Centuries' (1895); and 'The Religion of Hope' (1896).

Moyobamba, mō-yō-bām'bā, or **Moyabamba**, Peru, capital of the department of Loreto, on the Mayo River, 120 miles east of Chachapoyas. It is noted for its manufactures of Panama hats. It occupies an isolated position on a gravelly plateau intersected by deep ravines. Its chief communication is by river with Brazil, the Mayo as an affluent of the Hualaga connecting with the Amazon. Pop. (est.) 10,000.

Mozambique, mō-zām-bēk', South Africa, a Portuguese territory on the east coast, separated from Madagascar by the Mozambique Channel. It extends for about 1,300 miles from Cape Delgado to Delagoa Bay, and inland is bounded chiefly by British territory and the Transvaal. It received from the Portuguese the name of the State of East Africa (see EAST AFRICA, PORTUGUESE), and is divided into three provinces, Mozambique, Lorenzo Marques and Zambesi. The whole territory is under a commissioner appointed for three years, part of it is administered by the Mozambique Chartered Company. The area is estimated at about 295,000 square miles. The coast is generally low, beset with reefs and small islands, and possessed of very few good harbors. This, together with the sand-banks, shallows, currents, etc., renders navigation at all times dangerous. Much of the coast district is barren or swampy, though here and there fertile cultivated tracts occur. Inland rises a broad plateau, with groups and chains of mountains running mostly parallel to the coast, and nowhere reaching a great height. The climate is excessively hot, and except on the elevated regions, unhealthful. The flora and fauna peculiar to Africa are here found in the greatest richness. Most tropical fruits thrive; cotton succeeds well; and the forests produce valuable woods. Elephants, rhinoceroses, hippopotami, buffaloes, etc., are abundant. In language the native population belongs to the great Kaffir family. The trade is now growing to some importance, the chief seats being Mozambique, Quilimane, Beira, and Lorenzo Marques. From the last two a railway runs inland. The town of Mozambique is situated upon a small coral island near the coast. It has the governor's palace, two churches, a hospital, a prison, warehouses, etc. The harbor is secure. Pop. 8,000. The principal exports are ivory, india-rubber, ground-nuts, copal, wax. Though Mozambique has belonged to the Portuguese for centuries, they have done little for the development of its resources. Population estimated at from 800,000 to 1,500,000.

Mozambique Channel, the passage between the east coast of Africa and the island of Madagascar, about 1,050 miles long from north-

east to southwest, 530 miles wide at its southern entrance, about 250 miles wide in the centre, and nearly 600 miles wide at the northern entrance, where lie the Comoro Islands. The harbors of Mozambique and Beira are on its west shore.

Mozar'abic Liturgy, the liturgy used by the Mozarabs, or "spurious Arabs," that is, the Christians who submitted to the Moorish government, in Spain, while retaining their own religion. This office is sometimes styled "Officium Gothicum" or "Isidori Missale," because it was in vogue during the Gothic domination and was first revised by the great and learned Isidore of Seville in the 6th century. In Toledo after the gradual adoption of the Roman missal throughout Spain during the 11th and 12th centuries, Ximenes, cardinal archbishop of the see, revised the ancient office (1285) and built the beautiful chapel at the west end of the Cathedral where the old Gothic ritual is still observed. It is supposed from the Greek affinities of its form, that the original liturgy was brought from Asia Minor by the Goths who dwelt south of the Bosphorus in the 5th century.

Mozart, mō'zärt (Ger. mō'tsärt), **Johannes Chrysostomus Wolfgangus Theophilus**, Austrian composer: b. Salzburg, Austria, 27 Jan. 1756; d. Vienna 5 Dec. 1791. With this somewhat harsh combination of names Mozart was baptized on the day following his birth. His parents were Johannes Georg Leopold Mozart, and his wife Anna Maria.

Until 24 years of age Mozart led a wandering life, being taken on several tours by his father, who, while himself fully appreciating the child's genius, chafed under the continuous disappointments resulting from the fact that it was not productive either of the appreciation or financial returns which it so richly deserved. But later the musical world recognized his powers, nor has there since his death been any stint of praise for his marvelous achievements. Mozart's genius was not merely the brilliant flash of a meteor, dazzling the world for a brief moment and then gradually flickering out. He did not earn his title of "musician of musicians" through one sublime effort in early life. Of him, perhaps more than of any of the other great composers, it may be truly said that his powers steadily increased as he grew older, a statement borne out by the fact that three of his greatest works were composed during the last year of his life.

Nor is this high estimate of his worth confined to those of the laity who since his time have been capable of appreciating his wonderful genius. All men, including his fellow artists, paid sincere homage to him as supreme in several of the departments of the musical art. Thus Rossini, on being asked who was the greatest musician, first replied "Beethoven"; but when the question was put "What of Mozart?" he answered "Mozart is not the greatest, he is the only musician in the world." Again, Gounod in an address before the Académie des Beaux Arts in 1882 expressed his deep admiration for Mozart in the following words: "Oh, divine Mozart, . . . bounteous nature had given thee every gift: grace and strength, fulness and sobriety, bright spontaneity and burning tenderness, all in that perfect balance which

MOZART

makes up the irresistible power of thy charm, and which makes of thee the musician of musicians, greater than the greatest, the only one of all."

This sounds like high praise, and that was what Gounod meant it to be. And so throughout the ages men will continue to recognize the genuine fire of genius which animated his compositions, and which found its expression not only in his inimitable perception of the relation between the human feelings and the realm of tones, or in his inexhaustible power of interpreting widely different types of character, but above all in the superb beauty of proportion and balance which pervades his creations. Mozart was not only a brilliant composer, however, for he was also a remarkable performer on the piano, organ and violin. Haydn said that he could never forget Mozart's playing, for "it went to the heart."

The number of separate published works ascribed to Mozart is 626, while he is also said to have written 294 compositions which were unfinished or unpublished. When only 3 years old Mozart showed evidences of his musical genius, perceiving which his father taught him minuets on the harpsichord, and at 4 years he commenced composing. His first appearance in public was in September 1761, as a chorister in some theatricals held at the University of Salzburg. In his 6th year he composed his first published work—a 'sonata pour clavier.' When 7 years old the Mozart family visited Paris, Wolfgang playing the violin and organ at several churches *en route*. Here he composed a Kyrie, his first sacred piece. Later in the year they went to London, where the boy's playing, and especially his power of improvising, excited the greatest admiration. In 1764, while in London, he produced 10 sonatas for the clavier and violin, six of which, dedicated to the Queen, were brought out early in the following year. In January 1766, Wolfgang gave two concerts in Amsterdam, at which all the instrumental work was of his own composition. Later, on the occasion of the installation of the Prince of Orange as stadtholder, he composed a concerto named 'Galimathias musicum.' After several months of travel the family returned to Salzburg in November. Here they remained till September 1767, Wolfgang devoting himself to study and composition. He composed a part of a sacred cantata for the archbishop of Salzburg, a Passion-cantata, his first concertos for the piano, and a Latin comedy, 'Apollo et Hyacinthus.' In September he was again in Vienna, his father being attracted there by the approaching betrothal of the Archduchess Josepha to King Ferdinand of Naples. Here much jealousy and intrigue was displayed, and although Mozart composed an opera, 'La Finta Semplice,' at the request of the Emperor, it was not given a performance. Mozart, however, had the satisfaction of producing privately his operetta entitled 'Bastien und Bastienne.' He also composed an offertorium and a trumpet concerto to be used at the consecration of a new church at the Waisenhaus.

After the return of the family to Salzburg Mozart was in 1769 appointed Concertmeister, and a performance of 'La Finta Semplice' was then arranged. He next composed two masses,

and the Johannes Offertorium for a priest in the monastery at Secon. Preparations were now made for a tour of Italy, the family arriving at Milan at the end of January 1770. While in Rome he visited the Sistine Chapel to hear Al-legri's 'Miserere.' On his return he wrote down the entire work from memory, a feat which did much to spread his fame abroad. They next visited Naples where his concerts were brilliantly attended. In Bologna he was honored by election to the 'Accademia dei Filarmonici,' his test piece being an antiphon for four voices, which he composed in about half an hour.

His first opera 'Mitridate Rè di Ponto' was composed and produced in Milan, where it was performed 20 times. In Padua, on his way home, Mozart was commissioned to compose an oratorio, perhaps 'Betulia Liberata,' which was first performed in Lent, 1772. His stay at home was brief, for his friend Count Firmian, who had met him when in Milan, commissioned him to write a dramatic serenata to celebrate the nuptials of Archduke Ferdinand with Princess Maria of Modena. On 17 Oct. 1771, the performance of 'Ascanio in Alba' was given with very gratifying results. The next month saw Mozart in Milan again and hard at work on his opera 'Lucio Silla,' which was at length produced at the Milan opera house with great success. On reaching home Mozart composed four symphonies, three divertimenti for a wind orchestra, a grand concerto for two violins, and a mass, and in the following year two masses, a grand litany, two vesper psalms, an offertorium, a bassoon-concerto, four symphonies, two serenatas, etc. The next visit was to Munich where young Mozart was engaged to compose an opera for the carnival of 1775, and on 13 January 'La Finta Giardiniera' was produced. From that time to September 1777 Mozart, now a young man of 21, devoted himself to composing, and the list of his pieces is very extensive. Later in the year he visited Mannheim with his mother, and while there had his first love affair, the young lady being Aloysia, second daughter of Fridolin Weber, a prompter and copyist. His father on hearing of it, ordered them away to Paris, where they arrived in March 1778. Here he composed several pieces, including a gavotte, a quartette for flute and strings, and some parts of a 'Miserere,' which were produced without even the mention of his name. On 3 July of this year his mother died. Again we find him in Salzburg in mid-June 1779, during which year he wrote the music to Gebler's drama 'König Thamos,' the operetta 'Zaide,' several sonatas dedicated to the Electress of Bavaria, an aria for Aloysia Weber, whose love for Mozart had, however, grown cold, and a number of minor pieces for which he had received commissions. His first great opportunity came in 1780 when he received orders to furnish an opera for the Munich carnival. It was entitled 'Idomeneo, Rè di Creta,' and had its first performance on 29 Jan. 1781. Mozart now received a summons to Vienna from the archbishop, who, however, seems to have treated him as a menial. Finally severing his official relations, he took lodgings with the Webers. During the summer he wrote an opera for the National Singspiel (German) founded by the Emperor in 1778, and in spite of many obstacles 'Entführung aus dem Serail'

was produced by the Emperor's express order on 16 July 1782. A month later he made Constance Weber his wife.

Mozart's marriage seems to have brought with it a succession of difficulties. Constance was a poor manager, and Mozart was as yet without any fixed appointment. He gave a series of subscription concerts which were well attended, and during six weeks played at 17 concerts besides five of his own arranging. In July 1783 he took his wife to Salzburg to present her to his father, and in August produced a mass in the Peters Kirche, which he had composed in honor of his wife, who sang the soprano part on that occasion. During the latter part of 1785 Mozart was engaged on one of his masterpieces, an opera based on Beaumarchais' comedy entitled 'Le Mariage de Figaro.' The first public performance of the opera ('Le Nozze de Figaro') took place on 1 May 1786, and the triumph of the composer was complete. In 1785 Mozart wrote 'Davidde Penitente' for the Society of Musicians, and some music for the vaudeville piece 'Der Schauspiel-Direktor' was also produced. In 1787 Mozart and his wife visited Prague in response to an invitation from Count Thun. Here it was decided that he should compose another opera, which he did for the small sum of 100 ducats. 'Don Giovanni' was the result, and its first performance was given on 29 Oct. 1787. Returning to Vienna in November, he was appointed Kammer-compositor with a salary of 800 gulden.

The year 1788 was a very busy one for Mozart. In six weeks he wrote his three last and finest symphonies (in C, E flat and G minor), as well as several pieces for the piano, arranged five fugues from Bach's Wohl-temperirte Clavier for string quartette, and added wind parts to Handel's 'Acis and Galatea,' 'Messiah,' 'Ode to St. Cecilia's Day,' and 'Alexander's Feast.' In 1789 Mozart was offered the post of Kapellmeister at the Prussian court. The salary was 3,000 thalers, but in spite of the comforts which this comparatively large income would have insured, Mozart declined rather than forsake his "good Kaiser." Arriving in Vienna on 4 June, and being in much trouble, partly on account of his wife's constant illness, he informed the Emperor of the offer of the King of Prussia, and tendered his resignation. The Emperor exclaimed: "What, Mozart, are you going to leave me?" Mozart replied, "Majesty, I throw myself upon your kindness—I remain." The Emperor then ordered him to compose a new opera, which under the title 'Cosi fan tutte,' was produced on 26 Jan. 1790.

During the last year of Mozart's life, as already stated, he composed three of his greatest works, two of which must be always reckoned among the highest of musical creations, namely, the opera 'Die Zauberflöte,' and the 'Requiem,' which latter he was commissioned to compose under very mysterious circumstances. Mozart's health had now become much impaired and he was greatly depressed. He believed that he was writing this 'Requiem' for himself. The third notable composition of this year was the opera 'La Clemenza di Tito,' composed for the coronation of Leopold II. at Prague, which took place 6 September, the opera being performed on the same evening. His recent exertions and excitement proved too much, how-

ever, for his remaining strength, and on 5 Dec. 1791, he died of malignant typhus fever. He was buried in a pauper's grave in the churchyard of St. Marx.

R. I. GEARE,

National Museum, Washington, D. C.

Mozart, mō'tsärt or mō'zärt, **Leopold**, German composer: b. Augsburg, Bavaria, 14 Nov. 1719; d. Salzburg 28 May 1787. He became Kapellmeister to the archbishop of Salzburg. He wrote voluminous amounts of music, and published a justly famous 'Violin School' (1756), the first theoretical and practical guide to that instrument, and long the only one. It passed into numerous editions.

Mozoomdar, mō-zoom'där, **Protap Chunder**, Hindu reformer: b. Calcutta, India, about 1840. He joined the association of the Brahmo-Somaj (q.v.) organized for the purification of Brahmanism, and edited at Calcutta the 'Theistic Quarterly Review' and the 'Interpreter,' published by that organization. In 1874 he visited England and in 1883 the United States, being received with honor by leading men of both nations. In 1893 he made a second visit to the United States to attend the World's Parliament of Religions, before which he read a paper on the Brahmo-Somaj. He has written 'The Oriental Christ' (1883); 'Life and Teachings of Keshub Chunder Sen' (1887), and articles for English and American periodicals.

Much Ado About Nothing, a comedy by Shakespeare first played in 1597-8 and published in 1600. The outline of the serious portions of the drama the poet took from Bandello, through Belleforest's translation; the comic scenes are all his own. Bandello presumably borrowed his incidents from the narrative of 'Ariodante and Ginevra' in the 'Orlando Furioso' of Ariosto.

Mucic Acid, $C_6H_{10}O_8$, an organic acid formed by oxidizing milk sugar, or galactose, gum arabic and certain other substances, by the action of nitric acid. It crystallizes in colorless tablets which are insoluble in alcohol, slightly soluble in cold water, and rather freely soluble in boiling water; though when boiled

MUCILAGE — MUCUS

with water it becomes converted into an isomeric substance known as "paramucic acid." Mucic acid melts at about 410° F., does not reduce Fehling's solution, and combines with ammonia and with metallic and organic bases to form an extensive series of salts.

Mucilage, a solution of gum in water. In chemistry, the gum of seeds and roots. The name is also given to commercial adhesive gum made from gum arabic or dextrin. Mucilages, in pharmacy, are water preparations of substances dissolved in water, used to suspend insoluble ingredients or to bind them together in a mass.

Mucin, an albuminous proteid substance, which is an important constituent of the connective tissue of the animal body, and which gives to the mucous membranes their characteristic sliminess. It may be isolated by extraction with lime water (or with pure water), and subsequent precipitation with acetic acid, in excess of which mucin is insoluble. Mucin is not precipitated by heat nor by tannic acid. It is, however, precipitated by alcohol, or by saturating its solution with common salt, or with magnesium sulphate. When boiled with strong sulphuric acid, mucin yields leucine and tyrosine.

Mucius Scaevola. See *SCÆVOLA*.

Mücke, Heinrich, German painter: b. Breslau 9 April 1806; d. Düsseldorf 16 Jan. 1891. He became the pupil of Schadow in the Berlin Academy in 1824 and followed him to Düsseldorf in 1826. He was commissioned by the Count Spee to fresco the Castle of Heltorf with scenes from the life of Frederick Barbarossa, and on the completion of this work set out on his student travels through Italy (1833). On his return he painted numerous religious and historical pictures, and furnished illustrations for certain *éditions de luxe* of standard authors. His principal works are 'Saint Catharine Carried by Angels to Mount Sinai' (1836); 'Saint Elizabeth of Hungary Distributing Alms' (1841), both in the Berlin Museum; 'Dante Reciting the Divine Comedy'; 'The Madonna and Child with David'; 'John the Baptist and Saint Aloysius,' a fresco in Saint Andrews Church, Düsseldorf; 'The Storming of Jerusalem by Godfrey de Bouillon'; 'The Introduction of Christianity into Wüpperthal,' a fresco in the town hall at Elberfeld; 'Scenes from the life of Saint Meinhard, Count von Zollern,' in Sigmaringen, over the tomb of Prince Anton von Hohenzollern; 'Christ on the Cross,' a large altar-piece in Marienberg; 'The Good Shepherd,' altar-piece in Kaiserswörth; 'Lurlei'; 'Ecce Homo'; etc. He also produced some water colors and designs illustrating the legends, historic incidents, and folk-lore of the whole Rhine valley. From 1844 to 1868 he was teacher of anatomy in the Düsseldorf Academy.

Mucker, nickname of certain mystic fanatics who were thus popularly derided as "canting hypocrites." The adjective is of ancient origin and did not connote a specific sect until it was applied to the followers of Johann Heinrich Schönherr in Königsberg. See *EBELIANS*.

Mucora'ceæ, the moulds. See *FUNGI*.

Mucous Membrane. The mucous membranes line passages and cavities which communicate with the exterior of the body, where they become continuous with the skin. They constitute the lining of the alimentary canal or

tract, which begins at the mouth and ends at the anus, a distance of about 27 feet, and is the passage through which the food for nutrition of the body is introduced, digested, and taken up for the preservation and health of the body. They also form the lining of the nose, the throat, the eyes, and of the respiratory apparatus, which comprises the lungs, the windpipe or trachea, and the larynx, together with the chest and the appropriate muscles.

The lungs or lights are two large spongy organs, permeable by air, and are contained within the chest, the heart lying between them. They are the essential organs of respiration, and are two in number, one placed in each of the lateral cavities of the chest. Each lung is conical in shape, and has an apex, a base, two borders, and two surfaces. The right lung, the larger, has three lobes; the left, two lobes. The trachea or air-tube is a cylindrical tube about $4\frac{1}{2}$ or 5 inches in length, from $\frac{3}{4}$ inch to 1 inch in diameter, and is always greater in the male than in the female. It divides into two bronchi, one for each lung. The right bronchus is wider, shorter, and more horizontal in direction than the left, and is about an inch in length; the left bronchus is nearly two inches long and more oblique in position. From the bronchi branch the bronchial tubes, which are distributed throughout the lungs, and the entire apparatus is lined with mucous membrane. The kidneys, the ureter, the bladder, the testes and the urethra in the male, and the ovaries, Fallopian tubes, womb, vagina, and vulva of the female are all lined with mucous membrane, together with the membrane of the ducts of glands which open upon it. The surface of the mucous membranes of the body is subjected to the contact of various matters, such as the food, the air, and the different glandular secretions and excretions. They are protected from undue irritation by a viscid liquid called mucus (q.v.), which constantly bathes their surface, and are also well supplied with blood-vessels and nerves. They are attacked by many forms of disease, all of which may be cured by prompt treatment.

Mucus, a semi-fluid substance, of a viscid, tenacious character, produced by the various mucous membranes of animals, and found covering the exposed surface of such membranes. Thus it is produced in the mucous membrane lining the nose, the mouth and throat, the gullet, stomach, large and small bowel, the air-tubes of the lungs, the kidneys, ureter, and bladder, the gall-bladder, the ducts of glands, the bile-ducts, etc. In all these situations it serves to lubricate the membrane over the surface of which it is spread, and to protect the delicate surface from the action of irritating agents. Its viscid character prevents it being readily removed, and thus enables it more effectually to discharge its protective function. It is to be noticed that many of the mucous membranes have special glandular structures embedded in them, which produce special secretions, not mucus, such as the mucous membrane of the stomach and bowels, whose secretions have special properties connected with the digestion of the food. The saliva from the mouth is a mixture of mucus and the special secretion from the salivary glands, which acts on the starchy elements of food. Other mucous membranes have no such special structures, and only mucus is secreted by

MUD BATH—MUDGE

them, such as the mucous membrane of the nasal passages. Mucus is secreted by glands situated deep in the mucous membrane, and such glands are found in the mucous membrane of the nose; similar glands of very minute form are found scattered thickly in the mucous membrane of the mouth, and are found of considerable size in the back part of the tongue, in the gullet, and other situations. But mucus is also produced by single epithelial cells, lining mucous membranes. The form of epithelial cell called the "goblet cell" is believed to be a mucous-secreting cell, and it is found in large numbers lining the mucous membrane of the air-passages, the stomach, and bowels. So that by their agency the special digestive secretions of stomach and intestines contain a large admixture of mucous material. Pure mucus is transparent, but it is usually turbid from the presence of foreign materials, and epithelial cells from the secreting membrane. Its chief ingredient is mucin, a derivative from albuminous bodies, consisting of carbon, hydrogen, oxygen, and nitrogen, but, unlike albumin, containing no sulphur. It is held in suspension by water, forming an opaque liquid, but is not dissolved by it. Besides mucin, mucus contains small quantities of proteid substances and salts, chiefly common salt. Water constitutes nearly 94 per cent of its bulk. From fluids containing it in suspension, such as bile, it may be precipitated in a flocculent stringy mass by alcohol. Heat does not coagulate it; and it is dissolved by weak solutions of alkalies and alkaline earths.

Mud Bath, in which the body is immersed in mud. At Eger, Bohemia, black mud is heated to a temperature of 100°. It contains sulphate of soda, iron, lime, alumina, and ulmic acid. The body is immersed for 15 minutes, after which the patient goes into water to remove the mud. Such a bath may be of use in chronic skin diseases, rheumatism, gout, etc.

Mud-buffalo, a name, in the leather trade, for the Indian buffalo (*Bos bubalus*) as found in a wild or semi-wild condition in the Malay Peninsula, where they frequent swamps and are shot for the sake of their hides. These hides are not tanned, but are sent green to India, Europe and America to be used in the making of loom-pickers, mallets, gears, and other tools used in cotton-milling. They become harder than wood, and are tougher and more elastic.

Mud-cat. See CATFISH.

Mud-eel, the mud-puppy. See PROTEUS.

Mud-fish, the name of various fishes found in muddy water, or fond of burrowing in the ooze of swamps. The Nile bichir and its relatives, the reed-fishes (q.v.) of the sluggish African rivers, are so called; also the lepidosiren and other dipnoans, which grovel on muddy bottoms. In the United States, the name belongs to some small mud-minnows (q.v.), and to a curious fish (*Amia calva*) of the Mississippi Valley, known as dogfish, bowfin and by various other names. This, like the other mudfishes mentioned, is a lone survivor of a group of remote origin and large importance in past ages, allied to the ganoids. It is a rather shapeless, dark-colored, exceedingly hardy fish, reaching a length of two feet and a dozen pounds in weight. It is carnivorous, feeding voraciously upon crayfish, small mollusks and

anything it is able to seize and swallow; and it greedily seizes a baited hook and then fights gamely for its life, so that it is a favorite with anglers, though hardly fit to eat.

Mud-hen, or **Marsh-hen**, a sportsman's name for any of several rails, gallinules, coots and similar birds which make their home in marshes; it is most often given in the North to the gallinule (*Gallinula galeata*), a bird of the rail family, much like the British water-hen (*G. chloropus*), and common in the marshes about the Great Lakes and Mississippi Valley, where its cluckings resound in summer from every reedy marsh. It is about a foot in length, olive-brown on the back, dull black on the under parts and with a red bill. It is migratory; but the Southern States have a smaller and more handsome mud-hen in the resident purple gallinule (*Ionornis martinica*).

Mud-minnow, or **Dogfish**, one of the small fresh-water carnivorous fishes of the family *Umbriidae*, related to the pikes, and to the Alaskan blackfish (*Dallia*). It lives in muddy bayous, and among weeds at the bottom of clear but sluggish streams, often burrowing in loose mud. There are two North American species: *Umbra limi* of the interior, and *U. pygmaea* of the eastern coast; and one in Austria. Such a distribution increases the probability that this is of "an archaic type, characteristic of some earlier fish-fauna." The mud-minnows reach a length of about four inches and are valued as live bait, since they will long endure with vigor impalement on the hook.

Mud-puppy, or **Water-dog**. See PROTEUS; for its development and metamorphoses, see EMBRYOLOGY.

Mud-shad, the hickory or gizzard shad (q.v.).

Mud-skipper, a minute tropical fish of the goby family and genus *Periophthalmus*, which is accustomed to go ashore and skip about the space between tide-marks, exploring the rocks, roots of trees, etc., for food, and skipping about like grasshoppers. Some curious qualities distinguish these little creatures, which are found from West Africa to Japan, and make them highly interesting to naturalists. Consult Day's 'Fishes of India' (1878) and other works on the natural history of the Eastern seas.

Mud-turtle, or **Mud-tortoise**, any fresh-water turtle usually found in muddy places. In the United States, the ordinary mud-turtle is *Cinosternon pennsylvanicum*, which has a grayish-brown smooth shell, and a dark-colored head, with light dots. See BOX-TURTLE.

Mud-wasp, one of the many kinds of solitary wasps which fabricate out of wet clay cell-like receptacles, variously shaped and placed, in which to store their eggs and the provision for the larvæ. See WASP.

Mud'dock, **Joyce Emmerson**, English journalist and author; b. Southampton, England, 28 May 1843. He has been connected with several London journals and beside publishing some 30 volumes under the nom de guerre of "Dick DONOVAN" is the author of many other works, among which are: 'Basile the Jester'; 'The Great White Hand'; 'Fair Rosalind.'

Mudge, **Enoch**, American Methodist clergyman; b. Lynn, Mass., 28 June 1776; d. 2 April

MUDGTAHIDS — MUHLENBERG

1850. He became an itinerant clergyman of the Methodist Church in 1793, and in 1793-9 traveled on his duties about Maine until hardships affected his health, and he was settled at Orrington (1799-1816). During this period he was twice elected to the legislature, where he obtained the repeal of a law imposing a tax on other denominations for the benefit of the Congregationalists. Having resumed itinerancy in 1816, he was stationed at Boston, Lynn, Portsmouth, Newport, and other places. From 1832 until his retirement from active life in 1844, he was pastor of the Seamen's Chapel at New Bedford. He was a member of the Massachusetts constitutional convention in 1819. He contributed much to the press, and published in book-form: 'Camp-Meeting Hymn-Book' (1818); 'Notes on the Parables' (1828); 'Lynn,' in verse (1830); and 'Lectures to Seamen' (1836).

Mudgtahids. See MOHAMMEDANISM.

Mudie, mūd'i, **Charles Edward,** English publisher: b. Chelsea, England, 1818; d. London, England, 28 Oct. 1890. He engaged in business as a bookseller and in 1842 established his famous circulating library in England which in 1864 he formed into a limited company. At the time of his death in 1890 it had a membership of 25,000 and its annual receipts were \$500,000.

Mudir, moo-dēr', the title of a Turkish official; one who is at the head of a canton. In Egypt, the governor of a province.

Muezzin, mū-ēz'īn, in Mohammedan countries the beadle of the mosque, whose duty it is to summon the faithful to prayer at the assigned periods by public proclamation from the minaret (q.v.).

Muf'ti, the title of a high Turkish official: The Grand Mufti or Sheikh-ul-Islam is one of the interpreters of the Koran, by whose decisions the cadis have to judge.

Mugger. See MARSH-CROCODILE.

Muggleto'nians, a religious sect founded (1610) by Lodowick Muggleton in London. He claimed that he and his friend John Reave, a tailor like himself, were the two witnesses who should "prophesy a thousand two hundred and three score days, clothed in sackcloth" (Rev. xi. 3). He was 40 years old when he received this commission through visions and mysterious voices. 'The Divine Looking Glass' (1656) contains an exposition of the teachings of the Muggletonians who deny the doctrine of the Trinity and believe in a material God, who suffered on the cross. This Muggletonian bible was republished 1846.

Mugwort, an ornamental and culinary herb. See ARTEMISIA.

Mugwump, in American politics, a term originating during the presidential campaign of 1884 between Grover Cleveland and James G. Blaine. It was applied by a New York newspaper to such members of the Republican party as refused to support their party nominee, James G. Blaine, and advocated the election of Grover Cleveland in the interest, they claimed, of civil service reform. The word belongs to the Algonquin dialect of the Indian languages and is used by John Eliot in his translation of the Bible to translate the Hebrew word *allaph*, a "leader." Eliot used it in the sense of "big chief," a term more comprehensible to the Indian mind than that which appears in the King James' version

—"duke." The word was spelled "Mugquomp" in the singular, and "Mugquompaog" in the plural. It appears in many places throughout the Algonquin translation of the Old Testament.

Muharram, moo-hār'am, the first month in the Mohammedan year.

Mühlbach, mül'bāh, **Luise.** See MUNDT, KLARA.

Muhleman, mül'mān, **Maurice Louis,** American author: b. near Alton, Ill., 27 Nov. 1852. He was graduated from the law school of Columbia University in 1879 and was appointed to the United States treasury service in 1872. In 1888-1901 he was deputy assistant treasurer of the United States. He has published: 'The Money of the United States' (1894); 'Monetary Systems of the World' (1896); etc.

Muhlenberg, mü'lēn-berg, **Frederick Augustus Conrad,** American Lutheran clergyman and politician: b. Trappe, Pa., 1 Jan. 1750; d. Lancaster, Pa., 4 June 1801. He was educated in Halle, Germany, and returning in 1770 was ordained to the Lutheran ministry. In 1773-6 he had charge of a Lutheran church in New York and then removed to Pennsylvania where he held several pastoral charges. He was a hearty sympathizer with the cause of the colonies and though not participating in the war aided his countrymen politically and ultimately abandoned his pastoral work for a political life. He served in the Continental Congress and was speaker of the first House of Representatives under Washington, and in 1795 his was the deciding vote which rescued the Jay treaty from defeat.

Muhlenberg, Gotthilf Henry Ernst, American Lutheran clergyman and botanist: b. Trappe, Pa., 17 Nov. 1753; d. Lancaster, Pa., 23 May 1815. He was a brother of F. A. C. Muhlenberg (q.v.), and was educated with him in Halle, Germany. He returned to America in 1770, was ordained to the ministry and became an assistant to his father who was in charge of a Lutheran church in Philadelphia. He served in various charges until 1780 when he accepted a call to Lancaster where he remained until his death. In addition to his pastoral duties he distinguished himself as a scientist and took first rank as a botanist. He published: 'Catalogus Plantarum Americæ Septentrionalis' (1813); 'Descriptio Ueberior Graminum' (1817); etc.

Muhlenberg, mü'lēn-bērg, Heinrich Melchior, German-American clergyman, organizer of the Evangelical Lutheran Church in America: b. Eimbeck, Hanover, 6 Sept. 1711; d. New Providence (now Trappe), Montgomery County, Pa., 7 Oct. 1787. He was educated at the University of Göttingen (1735-7), studied theology there (1737-8) and at Halle (1738-9), was ordained in 1739, and from 1739 to 1741 was deacon of the church at Grosshennersdorf, Upper Lusatia. On 6 Sept. 1741 he was called as missionary to the Lutheran congregations of Pennsylvania, located at Philadelphia, New Providence (now Trappe), and New Hanover. At that time there was a large number of Lutherans in America; but they were unorganized and without pastors, and such religious meetings as they had were conducted by laymen. Muhlenberg, who arrived at Charleston, S. C.,

MUHLENBERG—MUIR

22 Sept. 1742 and at Philadelphia 25 November, was well qualified for the work of effecting union and order. He at once entered on the duties of his charge, and preached his first sermon in Pennsylvania in an unfinished log-building at New Hanover 28 November. Though Muhlenberg's local pastorate was largely restricted to the three congregations which had summoned him, his activities were really those of a bishop. He traveled over a wide extent of territory, preached at Lancaster, York, and other places in Pennsylvania, in New York, and also occasionally in New Jersey, Maryland, and among the Salzburger Lutherans of Georgia. "There was probably," thinks Stoeber, "not a Lutheran church, in his day, in this country in which he had not officiated." He was at first looked upon as an intruder by Zinzendorf and other Moravians, with whom he was for a time involved in conflict. But so successful was he in his labors that by 1745 there was real need for the reinforcement from Halle, consisting of the Rev. Peter Brunnholtz and the catechists Kurtz and Schaum. The first church edifice at Philadelphia, St. Michael's, was completed in 1743, and on 25 June 1769 Zion's Church, then considered the largest and finest in the United States, was dedicated there. On 14 Aug. 1748 the first Lutheran synod in America was organized under the direction of Muhlenberg, who became its president. In 1754 Muhlenberg prepared the 'Kirchen Agende,' a directory for public worship, and in 1762 reorganized the Philadelphia congregation under a constitution which became the basis of that of most congregations later established. He identified himself with the American cause in the Revolution, and was in consequence subjected to many annoyances, particularly when Pennsylvania was the scene of war (1777-8). He was a linguist of high rank, versed in Hebrew, Greek, and Latin (in which he made an address at the synod of 1750), and proficient in English, Dutch, French, Bohemian, and Swedish. His large foreign correspondence appeared at Halle in 1787. Consult: 'Die erlaubte Klage über den Abschied treuer Knechte Gottes' (1788), a memorial sermon by J. H. C. Helmuth (with biographical sketch); Stoeber, 'Mémorial of the Life and Times of Muhlenberg' (1856); Mann, 'Life and Times' (1887), considered the best.

Muhlenberg, mü'lén-bërg, John Peter Gabriel, American patriot: b. Trappe (then New Providence), Montgomery County, Pa., 1 Oct. 1746; d. near Philadelphia 1 Oct. 1807. He was the son of H. M. Muhlenberg (q.v.), the founder of the German Lutheran Church in America. He was educated for the ministry, was for a time pastor of German Lutheran churches at New Germantown, N. J., and Bedminster, N. J. In 1772 he went to Woodstock, Va., and finding that in order to enforce the payment of tithes he must be ordained in the Episcopal Church, he was ordained priest in England. He was chairman of the Shenandoah County committee of safety, and 1774 a member of the Virginia house of burgesses. At Washington's request he became a colonel in the Continental army. His last sermon was upon the duties men owe their country; and saying, "There is a time for all things—a time to preach and a time to fight—and now is

the time to fight," he stripped off his gown after the service, appeared in full uniform, called for recruits and enrolled about 300 of the parishioners. He participated in several battles, was made brigadier-general in 1777, and major-general at the close of the Revolution. After the war he removed to Pennsylvania, where he was elected a member of the supreme executive council, and in 1785 became its vice-president. He served as representative in Congress from 1789 to 1795, and from 1799 to 1801. In 1801 he was elected United States senator, but soon resigned and was appointed supervisor of the revenue for the district of Pennsylvania. From 1803 till his death he held the office of collector of the port of Philadelphia. Consult Muhlenberg (II. A.), 'Life' (1849).

Muhlenberg College, in Allentown, Pa.; founded in 1867 under the auspices of the Lutheran Church. In 1903 there were connected with the college 15 professors and instructors, and nearly 200 pupils. There were in the library 12,000 volumes; the grounds, buildings, and furnishings were valued at \$105,000; the productive funds were \$165,732; and the annual income, including fees, tuitions, and from productive funds, over \$16,000. The courses of study lead to the degrees of A.B. and B.S.

Mühlhausen, mü'l'how-zën, Germany, a town of Alsace-Lorraine. See MÜLHAUSEN.

Mühlhausen, Prussia, a town of Saxony, in a fertile district on the Unstrut, 29 miles northwest of Erfurt. It has two interesting old churches, an old town-house, a gymnasium, various technical, commercial, and other schools, hospitals, an orphanage, etc. It manufactures woolen and cotton or mixed goods, hosiery, cigars, leather, cycles, sewing-machines, wooden wares, furniture; and carries on tanning, dyeing, malting, brewing, etc. The Anabaptist Münzer, a leader in the Peasants' war, had his headquarters here, and was executed near by in 1525. Pop. (1900) 33,433.

Mühlheim, mü'l'him. See MÜLHEIM.

Muir, mür, John, Scottish Sanskrit scholar: b. Glasgow 5 Feb. 1810; d. Edinburgh 7 March 1882. He was educated at Glasgow University and at Haileybury College, whence he passed into the Bengal Civil Service in 1828. He remained in India 25 years, filling various offices in the revenue and judicial departments. His fame will rest on his 'Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions,' illustrated (1858-70). The first volume discusses the legendary accounts of the origin of caste; the second, the primitive homes of the Hindu; the third, the opinions of Hindu writers on the Vedas; the fourth, the contrast between Vedic and later Hindu theology; and the last the cosmological and mythological conceptions of the Indians in the Vedic age. In 1862 he founded a chair of Sanskrit and comparative philology in the University of Edinburgh.

Muir, John, American naturalist and explorer: b. Dunbar, Scotland, 21 April 1838. He came to America in 1849 with his father, who settled near Fox River, Wis., and cleared a farm; entered the University of Wisconsin when 22; and after graduation in 1864 commenced the lonely journeys through Canada,

MUIR—MULBERRY

Eastern and Western United States, the West, and the South, that made him a botanist and a geologist. In 1868 after exploring the Yosemite Valley, he settled there, living alone in his mill and on the mountains for 10 years and making a particular study of glacial traces in the Sierra Nevada. On this subject he wrote letters to the New York *Tribune*, beginning in 1871; he discovered in the High Sierra 65 residual glaciers. He made his first trip to Alaska in 1879, discovered Glacier Bay, and Muir Glacier, and explored the upper courses of the Yukon and Mackenzie rivers; and in 1880 accompanied the DeLong search expedition to the Arctic. He has written much for periodicals, urging the formation of national parks—both the Sequoia and Yosemite are due to his efforts—and has published 'The Mountains of California' (1894), and 'Our National Parks' (1901).

Muir, Matthew Moncrieff Pattison, English chemist: b. Glasgow, Scotland, 1 Nov. 1848. He was educated at the universities of Glasgow and Tübingen and is prælector in chemistry in Gonville and Caius College, Cambridge. He has published: 'Qualitative Analysis and Laboratory Practice' (1874); 'A Treatise on the Principles of Chemistry' (1880); 'Chemistry of Fire' (1893). 'A Course of Practical Chemistry' (1897); 'The Story of Alchemy' (1902); etc.

Muir, Sir William, Scottish Arabic scholar; brother of John Muir (1801-82): b. Glasgow 1819. He attended lectures at the universities of Edinburgh and Glasgow and at 18 entered the Bengal civil service, where he attained distinction. He was lieutenant-governor of the Northwest Provinces, 1868-74, and financial minister to the government of India, 1874-6. Returning to England he sat on the Council of India, 1876-85, was elected principal of the University of Edinburgh, 1885-1900. He has published: 'Life of Mahomet' (1858-61; abridged ed. 1877); 'Annals of the Early Caliphate' (1883); 'The Koran, Its Composition and Teachings, and the Testimony it Bears to the Holy Scriptures' (1878); 'Extracts from the Koran' (1880); 'The Early Caliphate and Rise of Islam' (1881); 'The Mohammedan Controversy' (1897).

Mukden, mook-dên', **Moukden**, or **Fung-tien-fu**, China, capital of Manchuria, and of the province of Shinking, on a tributary of the Liau, about 500 miles northeast of Peking. It is a station on the Russo-Chinese railroad and is surrounded by an external wall, about 10 miles in circuit, and has also an inner wall 3 miles in circuit, enclosing the emperor's residence, the government offices, courts, and other buildings connected with them, which are all arranged on a plan similar to those of Peking. In 1631 the Manchu monarchs made Mukden the seat of government, and succeeding emperors have done much to enlarge and beautify it. The present ruling dynasty of China traces its ancestry back to the Manchu emperors of Mukden, before they conquered China and made Peking their capital. At Mukden are the tombs of the Manchu emperors, and the royal burying ground is ornamented with stone images of elephants as ponderous as some of the carved shapes that mark the graves of Egyptian kings. Muk-

den is to the Manchu class of Chinamen what Jerusalem is to the Jews, or Mecca to the Mohammedans. It is now a fine flourishing city with a population of about 200,000. Its port is Newchwang, about 120 miles distant, near the Gulf of Liao-Tong.

Mukhtar Pasha, mookh-târ' pash'â, (GHAEZEE AHMED), Turkish general: b. Brusa, Turkey, 1837. He was educated in the military schools in Brusa and in Constantinople and entered upon a military career. In the campaign of 1860 in Montenegro he played a conspicuous part and thereafter received steady and rapid promotion. He became a full general in 1870 and in 1873 was appointed minister of public works. In the wars of Bosnia, Herzegovina and Montenegro in which he commanded he displayed great generalship, gaining 20 victories and never suffering defeat. The campaign of Kars-Erzurum in 1877 went against him and he was defeated by the Russian general Melikoff after a brilliant engagement for which he received the highest Turkish military title "Ghazee." In 1878 he was made grand master of the Turkish artillery, in which capacity he subdued the Cretan insurrection in that year, and in 1885 was designated to the post of Turkish High Commissioner in Egypt.

Mulat'to (Spanish *mulato*; from *mulo*, a mule), the offspring of a white person and a black. Numerous other words are used to indicate various degrees of negro blood, but the only one which has become common in Europe is quadroon, three fourths white and one fourth black. The term octoroon is also used in the United States for a person seven eighths or nearly white. Other names as musto, mustafna, cabre, griffe, quatsalvi, tresalvi, and many others, are indigenous growths of different European colonies. In Spain the term mulatto is often applied to those persons in whom the Moorish blood has been mingled with the Spanish. See MISCEGENATION.

Mulazalites. See MOHAMMEDANISM.

Mulberry, a genus (*Morus*) of trees of the order *Moraceæ* (q.v.), of which 100 species have been described, but only five are now recognized. The mulberries are characterized by the possession of leaves variable in form even upon the same twigs; monœcious flowers in axillary catkins; and multiple blackberry-like fruits formed by the coherence of the pistillate flowers which become fleshy as they swell. They are natives of the mild parts of Asia and Europe, whence they have been taken by man to similar regions throughout the world. In the Old World various species are of economic importance, principally because their foliage supplies the food of the silkworm, and their fruit a dessert and a wine. The wood of most species is of inferior quality but that of one species, the red mulberry (*M. rubra*), is fine-grained, strong, and useful for ship-building. The trees are readily propagated by means of seeds, layers, cuttings, or by graftage. They thrive upon almost any soil; even on rocky hillsides and gravelly lands, but succeed best upon arable soil in which they may be planted from 20 to 40 feet apart, and cultivated like other orchard fruits until they have full possession of the ground. The fruits which are borne in great profusion are too soft for market purposes, and usually too sweet for

JOHN MUIR.

MULCH — MULE

preserving alone. They are generally shaken from the trees upon sheets. Pigs are very fond of them.

The following are the most important species. The white mulberry (*M. alba*) is the silkworm mulberry, and has produced most of the named American varieties valued for their fruit, but not those esteemed in Europe. The black mulberry (*M. nigra*) is the European "dessert" species, and is little used for the feeding of silkworms. The red mulberry (*M. rubra*) is a native American tree to be found from Massachusetts to Nebraska and southward to the Gulf States. It has produced several good dessert varieties, the fruits of which are characterized by greater acidity than those of the Old World sorts. It seems to be ill adapted to the feeding of silkworms. The so-called Russian mulberry is a variety of the white. It produces inferior fruits but is valued in the Plains States for wind-breaks, for which purpose its ability to resist extremes of drouth, cold and neglect, specially fit it. All the above species have produced horticultural varieties, some variegated, others weeping, which are planted more for ornamental purposes than for fruit.

Another important species is the Indian (*M. indica*) which is used in silk culture and for its fruit, which is of fine flavor. It is cultivated in India, China and other countries of the East.

The paper-mulberry (*Broussonetia papyrifera*) is a native of Eastern Asia. This tree is of a moderate size, bearing leaves which are either simple or divided into lobes, more or less deep, rough above and hairy beneath. It was originally from India and Japan, but is now very commonly cultivated in Europe, and succeeds even in the more northern parts. The islanders of the Pacific make a kind of clothing from the bark of this tree in the following manner: Twigs of about an inch in diameter are cut and deprived of their bark, which is divided into strips, and left to macerate for some time in running water. After the epidermis has been scraped off, and while yet moist, the strips are laid out upon a plank in such a manner that they touch at the edges, and two or three layers of the same are then placed upon them, taking care to preserve an equal thickness throughout. At the end of 24 hours the whole mass is adherent, when it is removed to a large, flat, and perfectly smooth table, and is beaten with little wooden clubs till it has attained the requisite thinness. This kind of cloth is easily torn, and requires to be washed and beaten many times before it acquires its full suppleness and whiteness. The natives dye it red and yellow, and also make a similar cloth from the bread-fruit tree, an allied plant; but that from the mulberry is preferred. The paper which is used in Japan and many other countries in the East Indies is made from this plant. For this purpose the annual shoots are cut after the fall of the leaves, tied in bundles, and boiled in water mixed with ashes; after which the bark is stripped off by longitudinal incisions, and deprived of the brown epidermis. The bark of the more tender shoots is separated from the rest, as it furnishes a white paper for writing, while that produced by the remainder is coarse and gray, and serves for wrapping, or similar purposes.

Mulch, any material kept in a loose condition at the surface of the soil for the purpose

of checking evaporation, conserving moisture, protecting plant-roots or low-growing plants from frost or heat, preventing puddling and washing of the soil, retarding growth in spring, keeping the surface soil open, supplying plant-food, etc. The materials most frequently applied are straw, marsh-hay, leaves, litter, and brush; but the most widely important mulch is the surface soil itself, kept powdery by frequent tillage, given especially after rains when it is desirable to break the crust formed upon the surface. Since mulches keep the soil beneath them moist by breaking the capillarity, they are of particular advantage in dry climates; but since the vegetable mulches, such as straw and leaves, cannot be used in summer where the land must be cultivated and since they supply hiding places for insects, they can rarely be used advantageously in fruit plantations, in which they are often also a positive detriment because they encourage the growth of roots near the surface. In climates liable to extremes of temperature this position of the feeding roots is often disastrous to the crop if not to the plants themselves. Except, therefore, for winter protection, when such seems to be necessary, the soil itself is generally best. But the depth of the powdery layer will depend largely upon the climate, character of the soil, and kind of crop; in arid regions, with light soils, and with deep-rooted plants, the soil-mulches are usually deeper than with the reverse conditions.

Mulder, mool'dér, **Gerardus Johannes**, Dutch chemist and physician: b. Utrecht, Holland, 27 Dec. 1802; d. there April 1880. He was educated at the University of Utrecht and became professor of botany and chemistry there (1840-68), but first practised medicine in Amsterdam for some years. He was also for a short time professor of chemistry at Rotterdam. He became known chiefly through his researches on the proteids, and advanced the belief in a hypothetical substance which he called protein. This he believed to be the essential nitrogenous constituent of food, existing in animals, and derived ready-formed from plants and vegetables. The publication of this theory involved Mulder in a controversy with Liebig, who from the first doubted the existence of protein as an independent chemical compound. The whole theory has been abandoned, and the word protein is now used to indicate the first element in compounds. His principal work 'Chemistry of Vegetable and Animal Physiology' has been translated into English by Fromberg, and his 'Chemistry of Wine,' by Bence Jones. He also wrote: 'Chemical Researches'; 'De Voeding in Nederland'; 'De Voeding van den Neger in Suriname,' and his posthumous autobiography 'Levensschets' (1881; 2d ed. 1883).

Mule, in zoology, a term loosely used as synonymous with hybrid, more usually applied to the produce of a male ass with a mare, the mule proper, and to the hinny, the offspring of a stallion and a she-ass. The mule does not attain maturity as soon as the horse, but is useful a much longer period. As a beast of burden it is in some respects preferable to the horse; it is easily fed, is equally good for carrying and drawing, its less sensitive skin enables it to support exposure to the weather; like the ass, it enjoys comparative immunity from disease, and it is as surefooted as a goat. Mules have

MULE DEER—MULHALL

been known from the earliest ages; there are frequent references to them in Scripture and in Greek and Latin literature. Kentucky, Missouri, and Kansas take the lead in mule-raising in the United States, and the small Mexican mule is a very useful animal. France is the most important mule-raising country in Europe; then come Italy, Spain, and Portugal, where they are used for pack and draft. They are largely employed as draft animals in warfare. Fecundation of the hybrid-female by the male ass or the stallion is not very rare, though she rarely throws a living foal. Consult: Feget-meier, 'Horses, Asses and Zebras' (London, 1895), and publications of the U. S. Department of Agriculture. (See HYBRIDITY.) For statistics of mules in the United States, etc., see LIVESTOCK, AMERICAN.

Mule Deer, or Blacktail, a deer of the western United States (*Cervus macrotis*; or *Odocoileus hemionus*), remarkable for its disproportionately large ears. Its common name "blacktail" among the hunters is due to the black color of the terminal part of the tail, distinguishing it from the "whitetail" or eastern deer (q.v.); but is better reserved for the Pacific coast species (see BLACKTAIL). This deer is rather larger than the eastern one, and is a deer of the rocky plains, and especially of the mountains, which it climbs in summer as high as it can go, pasturing upon alpine slopes, and resting upon the summits of cliffs and ledges where it has a wide outlook. Its gait is very distinctive, also, consisting of a series of jerking bounds very effective on declivities, but looking strange on a level plain. The character of the sport afforded by this deer depends much upon the kind of country in which it is hunted, the method of pursuit being very different in the chaparral of southern California from that followed among the broken plains of Montana. When hiding in summer it will often wait until almost touched before starting off. In winter it gathers into herds and wanders among sheltering hills and vales. It is therefore the characteristic deer of the Rocky Mountain region, and was formerly exceedingly numerous, and one of the principal sources of food and clothing for the Indians. Originally the species occurred commonly as far east as the plains and prairies extended; but was early exterminated in the central Mississippi Valley; and from about 1875 to 1895 was the object of persistent slaughter by hide hunters. At the beginning of the present century, therefore, it had nearly disappeared from the plains south of the upper Missouri, was scarce in the central Rockies, and numerous only in the less frequented parts of the northwestern States and adjoining provinces of Canada. Its hide makes the best of tanned deer-leather (buckskin), and its flesh is excellent. The mule deer is not much taller than the Virginian deer, standing about 3 feet 4 inches high at the shoulder, but is heavier and of coarser build. The ears are very large and thickly haired, the tail roundish, and white with black tip. The coat is dull yellowish in summer, palest in the southern desert varieties, but becomes bluish gray with the autumnal molt; face between the eyes dusky, elsewhere white; throat, abdomen and inside of the legs white; antlers forking equally, and each prong again bifurcating.

Consult: Caton, 'Antelope and Deer of America' (1877); Lydekker, 'Deer of all Lands' (1898); Baillie-Grohman, 'Fifteen Years' Sport and Life in the Hunting Grounds of Western America' (1900); Roosevelt (and others), 'The Deer Family' (1902).

Mule-killer. See MANTIS.

Mule Machine, a spinning machine in which the rovings are delivered from a series of sets of drawing rollers to spindles placed on a carriage, which travels away from the rollers while the thread is being twisted, and returns toward the rollers while the thread is being wound. It was invented by Samuel Crompton, of Bolton, England, and perfected in 1779. The combination which gave rise to the term mule was the junction of the drawing rollers of Arkwright with the spinning jenny of Hargreaves. The object of the machine is to deliver the roving with the required degree of attenuation and twist it as delivered. For this purpose, the spindles, instead of being stationary, are placed on a movable carriage, which is wheeled out to twist the threads and wheeled in again to wind on the spindles.

Mulford, Elisha, American Episcopal clergyman and philosophical writer; b. Montrose, Pa., 10 Nov. 1833; d. Cambridge, Mass., 9 Dec. 1885. He was graduated from Yale in 1855 and subsequently studied theology, law and philosophy. He entered the Episcopal ministry and held several rectorates, but from 1881 lived in Cambridge, Mass. He wrote 'The Nation' (1870), a much valued treatise on the philosophy of the State, and 'The Republic of God' (1881), relating to the philosophy of religion.

Mulford, Prentice, American journalist and author; b. Sag Harbor, N. Y., 5 April 1834; d. Sheepshead Bay, N. Y., 27 May 1891. He went to sea at 17; settled in California during the gold rush; there became a newspaper writer; in 1872 went to England to advertise California; and on his return to New York became editor of the department called "The History of a Day" in 'The Graphic,' holding this post for six years. In 1886 he started his famous "White Cross Library," a series by which he preached his own peculiar philosophy of life, which held that "thought-power" is indomitable. Besides this occult system, which was introduced to the public under such book titles as 'Force and How to Get It'; 'The God in Yourself'; and 'The Doctor Within'; Mulford wrote 'The Swamp Angel' (1888), a humorous story giving his solitary experiences in a New Jersey wild to which he retired in 1883; also 'Life by Land and Sea' (1889). He was found dead in his boat on Sheepshead Bay.

Mulhall, Michael George, Irish statistician; b. Dublin, Ireland, 1836; d. Killiney, Ireland, 12 Dec. 1900. He was educated in the Irish College at Rome, and in 1861 went to Buenos Ayres, where he founded the *Standard*, the first English daily paper in South America. He gained a wide reputation as a statistician, and in 1880 made a calculation of the census of the United States for 1900 which came within 95,000 of the number given by the census report in that year. He was a frequent contributor to the 'Contemporary Review,' and published: 'Rio Grande do Sul and Its German Colonies'

MÜLHAUSEN—MÜLLER

(1873); 'A Dictionary of Statistics' (1883); 'Fifty Years of National Progress, 1837-87' (1887); 'Industries and Wealth of Nations' (1896); etc.

Mülhausen, mül'how-zën, or **Mühlhausen**, (French, MULHOUSE), Germany, a town of Alsace-Lorraine, on the Ill River and the Rhône Canal, 66 miles by rail southwest of Strasburg, and 18 miles northwest of Basel, Switzerland. It is an important commercial and manufacturing centre, the principal seat of cotton spinning in western Germany, and carries on calico printing, dyeing, the spinning of woolen and worsted yarn, the manufacture of machinery, railway material, and numerous other industries. Its industrial importance dates from 1746, when a cotton-factory was established. It is noted for its model dwellings for the working classes in the "cité ouvrière," workingmen's colony, on the northwest, founded by Mayor Dollfus in 1853. A migration to the suburbs, however, is taking place, leaving the artisan colony in the occupation of small tradesmen. Mülhausen is first mentioned in 717; it became an imperial free city in 1273, and in the 15th century entered into an alliance with the Swiss, which lasted till 1798, when it became French. It was included in the cession of Alsace to Germany in 1871. Pop. (1900) 89,012.

Mülheim, mül'hîm, or **Mühlheim**, Prussia, two towns of the Rhine province: (1) Mülheim-on-the-Rhine, with a bridge spanning the river, is almost opposite Cologne. The town has manufactures of machinery, cables, wire ropes, wagons, velvet, silk, chemicals, etc. Pop. (1900) 45,085. (2) Mülheim-on-the-Ruhr, 14 miles north of Düsseldorf, has coal and iron mines, iron foundries, manufactures of iron-ware, machinery, glass, woolen and cotton goods, and a considerable trade in sandstone, building materials, and coal. The Ruhr is crossed here by a chain bridge and a railway bridge. Pop. (1900) 38,292.

Mulholland, Rosa. See GILBERT, LADY ROSA.

Mull, Scotland, an island of Argyllshire, the largest of the Inner Hebrides next to Skye. Its length is 35 miles; greatest breadth, 30; superficial area, 301 square miles. It is irregular in shape, and the large bay on the west side contains a number of islands, including Ulva and Staffa. Iona lies off its southwest extremity. The island is rugged and mountainous; Benmore, the highest mountain, is over 3,000 feet above the level of the sea. The principal village is Tobermory, pop. (1901) 1,019. Between the island and the mainland, on the northeast, is the Sound of Mull. Pop. (1900) 4,711.

Mullany, mül-lā'nī, James Robert Madison, American naval officer: b. New York 26 Oct. 1818; d. Bryn Mawr, Pa., 17 Sept. 1887. He was appointed to the navy as midshipman in 1832 and received steady promotion, becoming lieutenant in 1844. He served with distinction in the Mexican War, and at the outbreak of the Civil War in 1861 was promoted commander. He commanded the Onida in the battle of Mobile Bay and performed valiant service with her on that occasion. He was commissioned rear-admiral in 1874, and until 1876 was in command of the North Atlantic squadron, and in conjunction with Gen. Emory and Gen. Sheridan

at New Orleans protected American interests on the Isthmus of Panama. From 1876 until 1879, when he was retired from active service, he was governor of the naval station at Philadelphia.

Mullany, Patrick Francis. See AZARIAS, BROTHER.

Mullein, a genus of biennial and perennial herbs (*Verbascum*) of the natural order *Scrophulariaceæ*. The species, of which more than 100 have been described and more than 30 are cultivated, have tap roots, woolly foliage in rosettes during the first year, and terminal spikes or racemes of small, usually yellow, flowers which appear from midsummer until late autumn. Some species were formerly reputed medicinal. In America they are usually considered as weeds, but in Europe they are valued as ornamental plants, particularly for mixing with shrubbery and planting in the rear of flower borders. Though natives of the Mediterranean region, some species are known in England as American flannel or velvet plant. The best known species in the United States are probably the moth mullein (*V. blattaria*), the common mullein (*V. thapsus*), the white mullein (*V. lynchitis*), and *V. phlomoides*, which are all common in pastures and uncultivated fields.

Müller, Charles Louis, sharl loo-ë mü-lär, French painter: b. Paris 22 Dec. 1815; d. there 10 Jan. 1892. He was the pupil of L. Cogniet, Baron Gros, and others in the Ecole des Beaux-Arts, and in 1850 was made director of the manufactory of Gobelin tapestries. His fertility in the production of historic pictures and portraits was amazing. Among them are: 'Heliogabalus' (1841); 'Primavera' (1846); 'May-day'; 'Lady Macbeth'; and his masterpiece, 'The Last Victims to the Reign of Terror'; the last two being in the Luxembourg; 'Vive l'Empereur' (1855); 'Marie Antoinette' (1857); 'A Mass During the Reign of Terror' (1863); 'The Madness of King Lear' (1875); 'Mater Dolorosa' (1877). He executed the frescoes of the Salle d'Etat in the Louvre, and as a painter is more to be commended for clever drawing and composition than for his somewhat flat and mediocre coloring.

Müller, Friedrich, frêd rîh mü-lër, called "Maler Müller," or "Müller the Painter," German artist and poet: b. Kreuznach 13 Jan. 1749; d. Rome 23 April 1825. Some of his etchings, animals, compositions in the Flemish style, pastoral scenes, etc., were remarkable for their originality and freedom. He deserves more credit as a poet, for at a time when German poetry had degenerated, Müller helped to give a new impulse to German literature. His best works, 'Niobe,' 'Faust,' and 'Genevieve,' are characterized by richness, warmth, and elevated delineation of character, though sometimes wild and disconnected.

Müller, Friedrich Max, English philologist: b. Dessau, Germany, 6 Dec. 1823; d. Oxford 28 Oct. 1900. His father was Wilhelm Müller (q.v.), a famous German lyricist, and his maternal great-grandfather Basedow, the educational reformer. His bringing up was in his mother's hands, as his father died when the boy was 4. He studied in Leipsic at the Nicolaischule; had some thoughts of becoming a musician, but entered the University of Leipsic

in 1841, and there, under the leadership of Hermann Brockhaus, devoted himself to Sanskrit, publishing a German version of the 'Hitopadēśa' in 1844; worked under Bopp in philology and Schelling in philosophy at Berlin for a year; in 1845 went to Paris, where Burnouf suggested to him an edition of the 'Rig Veda'; and in 1846 went to England and interested the East India Company in this work, which he undertook at the expense of the Company. He was in Paris in 1848, and brought to Palmerston, in London, the first news of Louis Philippe's flight from Paris. In the same year he settled in Oxford, where the 'Rig Veda' appeared, with Sayana's commentary, 1849-74. He became deputy Tylor professor in 1850, and fellow of All Souls' in 1858; but in 1860 was defeated in his candidacy for the chair of Sanskrit by Monier Williams, after a fierce fight on the part of his opponents, who objected partly to his foreign birth and partly to his very free and unorthodox religious views. The result for linguistic science was unfortunate, as it turned Max Müller from the narrow field of Sanskrit, in which he easily outranked his contemporaries, to comparative philology and the science of religion, in which his achievements were less exact and scholarly, to say the least. In 1868 he became professor of comparative philology at Oxford. He was made a privy councillor in 1866. His greatest single work was as editor of the 'Sacred Books of the East,' a series of English versions of Oriental scriptures, to which he contributed three volumes, and which was begun in 1879 and is not yet complete. He is possibly even better known as a popularizer of the first principles of linguistic science, so that he became in the lay mind the main exponent of this science, whereas his grasp of its detail was inadequate, and many of the etymologies he advanced showed that he was not conversant with the strict rules of phonetics. But the charm of his style, his general grasp of so large a subject, and his admitted pre-eminence in Sanskrit, make interesting and valuable, if not absolutely authoritative, reading of 'The Science of Language' (1861-3); 'Essays on Language and Literature,' and 'Biographies of Words' (1888), all of which have passed through new editions. Max Müller's works on mythology and religion also have a higher repute among general readers than with the specialist, but it cannot be denied that they did much good in stimulating research, as the 'Sacred Books' did in supplying a field for such research. In this class of writings mention should be made of: the 'Essay on Comparative Mythology' (1856); 'Introduction to the Science of Religion' (1873); 'The Origin and Growth of Religion' (1878); 'Natural Religion' (1889); 'Physical Religion' (1891); 'Anthropological Religion' (1892); 'Theosophy, or Psychological Religion' (1893); the 'Essays on Mythology and Folklore' in the 4th volume of 'Chips from a German Workshop'; and 'Contributions to the Science of Mythology' (1897). His versions from the Sanskrit and the Pāli have been alluded to; 'A History of Ancient Sanskrit Literature' (1859), and a 'Sanskrit Grammar' also should be mentioned, and it should be borne in mind that it is in this field that the scholar spoke with authority. From his youth Max Müller was interested in philosophy; he wrote an excellent version of

Kant's 'Critique of Pure Reason' (1881); also 'The Science of Thought' (1887), urging that thought was inconceivable without language, and the Oriental studies, 'Three Lectures on the Vedānta Philosophy' (1894), and 'The Six Systems of Indian Philosophy' (1899). An entirely different side of the man is disclosed by 'My Indian Friends' (1899), which shows much of his broad and charming personality; or by 'Deutsche Liebe' (1857), a romantic and popular story translated into French, Italian, and Russian, and appearing in English in two versions, one American, unauthorized and very successful, and a later one (1873) by Mrs. Max Müller. He also edited his father's poems (1868), and Scherer's 'History of German Literature.' His collected works, including the four volumes of 'Chips from a German Workshop' (1867-75), appeared 1898 *et seq.* Consult his own 'Auld Lang Syne' (1898), and 'My Autobiography' (1901); and his wife's 'Life and Letters of Max Müller' (1902).

Müller, Georg Friedrich, German-English philanthropist: b. Kroppenstädt, Prussia, 27 Sept. 1805; d. Bristol, England, 10 March 1898. Entering the University of Halle as a student of theology in 1825, although he had fallen into irregularities of life, he was converted before the end of that year, and in the following year began to preach and teach. In 1829 he went to London, whither the Society for Promoting Christianity Among the Jews had invited him, settled at Teignmouth as pastor of Ebenezer Chapel, where he gave up pew-rents and substituted box-collections, finally refusing a salary and depending on voluntary gifts. In 1832 he joined Henry Craik, a prominent member of the sect of Plymouth Brethren, in ministerial work at Bristol. In 1835 he published a proposal for the establishment of an orphan home, which took shape in 1836 at Bristol. The experiment was successful, the work grew from year to year, and by 1875 no less than 2,000 children were lodged, fed, and educated without other financial maintenance than that received in donations from all parts of the world. The orphanage was moved in 1840 to Ashley Down, a suburb of Bristol. With his wife Müller made evangelistic tours in Europe, America, and Asia. He published 'A Narrative of Some of the Lord's Dealings with Georg Müller' (1837).

Müller, Johann Friedrich Theodor, yō hān frēd'rīh tāō-dōr (better known as FRITZ MÜLLER, and also known as MÜLLER-DESTERRO), German naturalist: b. near Erfurt 31 March 1821; d. 1897. After studying at the Universities of Greifswald and Berlin, he went to South America in 1848, and settled on the island of Santa Catharina, Brazil, living there the ordinary pioneer's life until appointed (1856) to teach natural history and mathematics in the Desterro gymnasium. From 1874 he was engaged for a time as collector for the museum at Rio de Janeiro. His published papers on crustaceans, insects, worms, jellyfishes, etc., were many, most of them appearing in the 'Annals' of the Rio de Janeiro Museum, Wiegmann's 'Archiv für Naturgeschichte,' and similar publications. In his 'Facts for Darwin' (1864), a book written under the stimulus of Darwin's 'Origin of Species,' he made valuable applications of Darwinianism in new fields, and won

MULLER

reputation among men of science for the originality and fertility of his observations and deductions.

Müller, Johann Gotthard von, German engraver: b. Bernhausen, near Stuttgart, 4 May 1747; d. Stuttgart 14 March 1830. After studying under Guibal, the painter, he turned to engraving, and in 1770 went to Paris, where, under Wille, he studied for six years, and after winning several prizes was elected to membership in the French Academy. Returning in 1776 to Stuttgart, he taught there for nine years. While there he was called to Paris to engrave a portrait of Louis XVI. This is regarded as his most important work, next to which may be ranked his 'Battle of Bunker Hill,' after Trumbull; 'Madonna della Seggiola,' after Raphael; etc. He was knighted in 1818.

Müller, Johannes von, German-Swiss historian: b. Schaffhausen 3 Jan. 1752; d. Cassel 29 May 1809. He studied at Göttingen, and in 1772 became professor of Greek at Schaffhausen. He lived and taught in Geneva 1774-80, where he began his 'Allgemeine Geschichte' (3 vols. 1810), and published the first volume of his 'Geschichte der Schweizer.' In 1786 he became librarian and councillor of state to the Elector of Mainz; in 1792, when Mainz was taken by the French, he went to Vienna, where the Emperor Leopold nominated him a member of the privy council. In 1804 he left Vienna for Berlin, where he was appointed historiographer of the Hohenzollern family. In addition to his important Swiss history and the 'Allgemeine Geschichte,' he published 'Ueber die Geschichte Friedrichs I.'; 'Ueber den Untergang der Freiheit der Alten Völker'; 'Versuch über die Zeitrechnungen der Vorwelt.' After the battle of Jena, he was appointed by Napoleon (1807) secretary of state in the new kingdom of Westphalia. His 'Sämmtliche Werke' appeared in 27 volumes (1800-17); (new ed. 40 vols. 1831-5). Consult lives by Heeren (1820); Döring (1835); Monnard, in French (1839); and Thiersch (1881).

Müller, Johannes, German physiologist and morphologist: b. Coblenz 14 July 1801; d. Berlin 28 April 1858. After studying anatomy and zoology at Bonn and Berlin, he became professor of physiology and anatomy at Bonn, and afterward succeeded Rudolphi at Berlin. Here he also edited the 'Archiv für Anatomie, Physiologie und Wissenschaftliche Medicin.' He remained in Berlin until his death.

Müller possessed one of the greatest scientific minds of the 19th century, and his remarkable powers of application, acuteness, and penetration led him into wide fields of research, where he succeeded in making most valuable observations. He is regarded as the founder of modern physiology. He summed up the work of his predecessors, instituted new methods of experimental and microscopic investigation, and carried out and recorded valuable observations in connection with the mechanism of sight, hearing, and voice. He contributed to the foundation of Bell's law and the principles of reflex action and other nervous movements. He further elucidated the chemical and physical properties of chyle, lymph, and bile, and studied in an original and fruitful way the phenomena of the glands and the quality of glandular secre-

tions. To Müller physiology owes the knowledge of chondrin. His 'Handbuch der Physiologie des Menschen' (1833-40; Eng. trans. 1840-9) exercised great influence as a text-book. Müller counted among his pupils such men as Helmholtz, Vierordt, Du Bois-Reymond, etc. He was also a student of comparative anatomy, and was the founder of the new morphology. His 'Vergleichende Anatomie der Myxinoiden' (1834-43) shows his wonderful insight into the subjects of comparative anatomy and morphology. He greatly enriched the subject of comparative embryology, and was the first to explain the real nature of hermaphroditism. He also discovered the pronephric ducts which bear his name.

Among his important publications is his 'Systematische Beschreibung der Plagiostomen' (1841); and in zoology, the 'System der Asteriden' (1842), in collaboration with Troschel, and 'Horæ Ichthyologicae.' He also published many articles in the 'Transactions of the Berlin Academy of Sciences.'

Consult: Virchow, 'Johannes Müller, Eine Gedächtnisrede' (1858); Bischoff, 'Ueber Johannes Müller und sein Verhältnis zum jetzigen Standpunkt der Physiologie' (1858); 'Proceedings of the Royal Society of London,' Vol. IX., p. 556.

Müller, Julius, German theologian: b. Brieg, Prussia, 10 April 1801; d. Halle, Germany, 27 Sept. 1878. He was educated at Breslau and Göttingen, and abandoned the study of law for theology. He was opposed to the Rationalists, and in 1825-31 was in charge of several small parishes. In 1831 he was preacher at Göttingen University, and in 1835 was elected professor of theology there. From 1835-9 he was professor in Marburg, and for the remainder of his life filled the chair of theology at Halle. His greatest work is 'The Christian Doctrine of Sin' (1829), and among his other books are: 'The Evangelical Union' (1854); 'Dogmatic Treatises' (1870); etc.

Müller, Karl Otfried, German archæologist and philologist: b. Brieg, Silesia, 1797; d. Athens 1 Aug. 1840. He was the son of a field preacher, and his education was begun at the gymnasium of his native town. He was then sent to Breslau, and afterward went to Berlin, where, as a pupil of Böckh, he devoted himself to the study of the life and art of the ancients. After publishing the 'Ægineticorum Liber' (1817) he was appointed instructor in the Magdalenum at Breslau. Here he made an elaborate analysis of Greek mythology, separating allegorical inventions from true history. In 1819 he was made professor of philology, and in 1823 became professor ordinarius at Göttingen. He was a great traveler, and his writings embrace the whole circle of antiquity. His intention was undoubtedly to concentrate the results of his whole life of scholarly activity in his great work, 'Geschichte hellenischer Stämme und Städte.' He only completed two volumes, however: Vol. I., 'Orchomenos und die Minyer' (1820), and Vol. II., 'Die Dorier' (1824). One of his best known works, 'A History of the Literature of Ancient Greece,' a translation by Lewis and Donaldson from the author's manuscript, was published in London in 1840, and the continuator, Donaldson, published another edition in 1858. His 'Kunstarchäologische Werke,' in

MÜLLER—MULLET

five volumes (1872-3), is a valuable work. Müller's 'Æschylus's Eumenides' (Göttingen, 1833) was the object of a profound controversy in which Gottfried Hermann and his followers attacked him with great bitterness. Karl Müller was also prominent as an editor. Consult the biography by Ranke (1870).

Müller, Morten. See MORTEN-MULLER.

Müller, Victor, German painter: b. Frankfurt 29 March 1829; d. Munich 21 Dec. 1871. Beginning his artistic career at the Frankfurt art school, he continued it at Antwerp and ultimately went to Paris (1849), where he stayed for eleven years, diligently studying the methods and manner of Couture, Delacroix and Courbet. He settled in Munich in 1865, and for the castle of Kronberg in the Taunus painted a series of scenes from the history of Baron Hartmuth von Kronberg. He also produced his famous 'Hero and Leander.' Following these works came 'Hamlet with Horatio in the Churchyard'; 'Ophelia'; 'Romeo and Juliet'; and his last and unfinished work 'Faust on a Stroll.' Among his other works are 'Wood Nymph'; 'Tannhäuser in Venusberg'; 'A Scene from Les Misérables.' His last finished picture was a 'Flower Girl.' All of his works are distinguished by a certain literary or poetic character which appeals to the fancy like a strain of lyric music, although the coloring sometimes runs in its vividness to the verge of extravagance.

Müller, Wilhelm, German poet: b. Dessau 7 Oct. 1794; d. there 30 Sept. 1827. He studied at Berlin but the war of 1813 called him from his books, and he was present as a volunteer in the Prussian army at the battles of Lützen, Bautzen, Hanau, and Kulm. In 1814 he returned to his studies at Berlin. His journey to Italy (1819) produced his ingenious work 'Rom, Römer, und Römerinnen' (1820), and on his return to Germany he became teacher of Latin and Greek in the newly established school at Dessau, where he was also appointed ducal librarian. In 1824 appeared his 'Gedichte aus den hinterlassenen Papieren eines reisenden Waldhornisten.' His 'Lieder der Griechen' (1821-4) celebrate the awakening of an oppressed nation, its struggle and its victory. His 'Lyrische Spaziergänge' (Leipzig, 1827) displays the same truth to nature, freshness, and fire, and the same harmony of language which characterizes his other poems. Many of his poems imitate with utmost perfection the true German Volkslied. Several of the 'Müllerlieder' are familiar through Franz Schubert's remarkable musical settings. His 'Bibliothek deutscher Dichter des 17. Jahrhunderts' (1822-7) is a valuable collection of the best lyric poems of that period. His works were collected in five volumes (1830). He was the father of Professor Max Müller, the well-known philologist.

Müller, William James, English painter: b. Bristol 28 June 1812; d. there 8 Sept. 1845. He studied painting under J. B. Pyne, and first exhibited in the Royal Academy in 1833, his picture being entitled 'The Destruction of Old London Bridge—Morning.' In 1833-4 he visited Germany, Switzerland, and Italy, and in 1838 Greece and Egypt; while in 1843 he accompanied the Lycian expedition under Sir Charles Fellows, bringing back many sketches and pictures of Oriental life and scen-

ery. He lived for some time in London, but returned to Bristol in later life. His pictures, though not numerous, are of exceptional power and merit, among the more notable being the 'Baggage Wagon'; 'Dredging on the Medway'; 'The Slave Market'; and the 'Salmon-weir.' He painted both in water-color and in oils, and was remarkable as a colorist.

Mullet, the name of several distinct kinds of fishes having external similarities. (1) The red mullets or surmullets are a group of elongate marine fishes of moderate size, renowned for the delicacy of their flesh, and the esteem in which they were held by the ancients. They with the goat fishes (*Upeneus*) and others form a family *Mullidae*, with five genera and about 40 species, found in all tropical seas, and some species straying northward. Jordan, who classifies them in the suborder *Berycoidei*, remarks: "The family is a very natural one and not closely related to any other." It resembles the barracudas (*Polymixiidae*) in having two long unbranched erectile barbels at the throat, which are of service in exploring the muddy bottom along which these fishes creep and search for animal food, mainly small crustaceans. The best known species is that of the Mediterranean (*Mullus barbatus*), which is a small fish, rarely exceeding 6 inches in length, and is carmine red on the upper parts and silvery white on the lower surface. This is the fish held in so high esteem by Roman epicures, and reared in ponds where they were attended and caressed by their owners, and taught to come to be fed at the sound of the voice or bell of the keeper. Specimens were sometimes sold for their weight in silver. Pliny instances a case in which the sum of about £60 sterling was paid for a single fish; and an extraordinary expenditure of time was lavished and wasted upon these slow-learning pets. Juvenal and other satirists descanted upon the height to which the pursuit of this luxury was carried as a type of foolish extravagance. Hortensius, the rival of Cicero, we are told, had a canal of water constructed below the festive table, in which the mullets were allowed to swim, and from which they might be carried to table, and thence to the fire to be cooked and dressed. Apicius invented a mode of drowning or suffocating these fishes in a certain sauce or pickle, which process was said to add highly to their flavor. A similar fashion prevailed of old in England with regard to lampreys, which were drowned in wine previously to being cooked and eaten. This mullet is still esteemed as an article of food, the flesh being white, fat, and nutritious. They are caught mainly in nets, and are hawked about the streets of Italian cities, not under the old Latin name "mugli," but by one from the Greek, "trigle." The roes are preserved as condiment called *botargo*, and resembling caviare.

A closely related fish, the striped red mullet or surmullet (*M. cephalus*), is caught abundantly about the British Islands and along the continental coast, and is seen sparingly in the local markets. By some naturalists these mullets are thought to be only the females of the Mediterranean species. A smaller form of the same species is frequently taken on the eastern coast of the United States. Another genus (*Mulloidides*) is represented in the Gulf of California by a single species.

MULLIGAN LETTERS — MULTAN

(2) The gray mullets are a group of spiny-rayed marine fishes forming a family (*Mugilidae*) of the suborder *Percesoces*, allied to the silversides and barracudas. They are oblong fishes of moderate size, without a lateral line, very numerous in species common in all warm parts of the world, and often appearing in vast schools, so that they may be captured by wholesale in large nets. Though the flesh is not so good as that of the red mullets it is nutritious, and many species are economically important. These mullets are short-finned, small-mouthed, bottom-feeding fishes, subsisting chiefly upon the little animals and organic matter found in sand and mud; and they have a special straining apparatus in the pharynx for the purpose of preventing objects of too large size from entering the stomach, or foreign substances getting into the gill-chamber; after grinding a mouthful between the pharyngeal bones (for teeth are absent or feeble) the mineral matter is rejected. Another peculiarity of the mullets is to be found in the structure of the œsophagus and stomach, the former being lined with long thread-like papillæ, while the latter has its second portion furnished with muscular walls like the gizzard of a bird, but not divided. The common species is the striped mullet or liza (*Mugil cephalus*) which seems to be almost cosmopolitan, as it is known not only on both Atlantic shores but abundantly from California to Chile. It is 1 to 2 feet long, dark bluish above, sides silvery, with conspicuous dark stripes along each row of scales. A smaller, more thoroughly marine species, dark olive and without streaks is the white mullet or liza blanca (*M. curema*), numerous on both American coasts. Several other species are taken in the Gulf of Mexico and southward, one of which (*M. gyrans*) has the curious habit of swimming round and round at the surface in schools, and is called whirlingig mullet.

(3) In the Mississippi Valley, several suckers (q.v.) of the family *Catostomidae* are called mullets in reference to their mullet-like appearance and behavior.

Consult: Gunther, 'Study of Fishes' (1880); Goode, 'Fishery Industries,' sec. 1 (1883); 'American Fishes' (1888); Jordan and Evermann, 'American Food and Game Fishes' (1902).

Mulligan Letters, in American political history, a series of letters written by James G. Blaine (q.v.) to a business associate, which it was alleged proved legislative corruption upon the part of Blaine. The letters were obtained by one James Mulligan, a clerk, who appeared as a witness before a Congressional committee appointed to investigate Blaine. On 5 June 1876 Blaine secured these letters and read them before the House, after defying the committee to compel him to surrender them. The letters were freely used as campaign documents in the Presidential contest of 1884, by Blaine's enemies.

Mullinger, mül'ling-gér, **James Bass**, English educator and author: b. Bishop Stortford, England, 1834. He was graduated from St. John's College in 1866 and in 1881-3 was lecturer at Bedford College, London. In 1885-95 he was lecturer on history of education at Cambridge and in 1890-4 lecturer on ecclesiastical history at Trinity College, Cambridge, since when he has been librarian and lecturer in history in St. John's College. He has published:

'Cambridge Characteristics in the 17th Century' (1867); 'The Schools of Charles the Great' (1876); 'The Age of Milton' (1897); 'History of St. John's College' (1901); and wrote the article 'Popedom' for the ninth edition of the 'Encyclopædia Britannica.'

Mullion, in architecture, a vertical division between the lights of windows, screens, etc. The term is also applied to the division between the panels in wainscoting.

Muloch, mü'lök, **Sir William**, Canadian educator and politician: b. Bond Head, Ontario, 19 Jan. 1843. He was graduated from the University of Toronto in 1863 and 1868 was admitted to the bar. He was first elected to the parliament of Canada in 1882 and was vice-chancellor of the University of Toronto from 1881 until 1900 when he resigned. He is postmaster-general of Canada and was instrumental in establishing the penny postal rate with other parts of the empire. Besides his public duties he is connected with many large financial interests.

Mulock, mü'lök, **Dinah Maria**. See **CRAIK**, **DINAH MARIA**.

Mulready, mül'réd-ī, **William**, Irish genre painter: b. Ennis, County Clare, 1 April 1786; d. London 7 July 1863. He went to London while yet a child, and there his talent for art came under the notice of Banks, the sculptor, who assisted him in his education, and in 1800 he became a student of the Royal Academy, where he first exhibited in 1804. In 1806 appeared his 'Hampstead Heath' and in 1809 'Returning from the Ale House' and 'The Carpenter's Shop.' He was elected an associate of the Royal Academy in 1815, and to full membership in the following year, an honor won by 'The Fight Interrupted.' Although purely English in his education, subjects, and general treatment, Mulready's pictures, in color and characteristic care of detail, have often suggested comparisons of him with the Dutch painters. While popular in character, his work never descends to the merely vulgar or sensational, his representations of common life being properly dignified by the fidelity and thoroughness of his art. Besides those already mentioned, his best known works include: 'Giving a Bite' (1836); 'Snow Scene' (1842); 'Choosing the Wedding Gown' (1846); 'The Bathers' (1857); and 'The Wolf and the Lamb.' His illustrations to 'The Vicar of Wakefield' were very successful. Mulready became most widely known through the ornamental design which he furnished in 1840 for the postal envelope devised by Rowland Hill (q.v.). Nearly all of Mulready's best pictures are now the property of the English nation.

Multan, mool-tän', or **Mooltan**, India, an ancient city of the Panjab, capital of a district, 164 miles southwest of Lahore, and four miles from the present bank of the Chenab. It is surrounded by a dilapidated wall, upward of three miles in circumference, and is overlooked on the north by a fortress. The principal manufactures are silks and fine cotton fabrics, while coarse cotton cloth is also produced for home consumption. Multan has an extensive foreign trade with the countries west of the Indus, and a large banking business is carried on by its merchants. The fortress built in 1640 stands on a mound of earth on the site of the old city. The vicinity is covered with a vast quan-

MULTIPLE STARS — MUNBY

tity of the ruins of tombs, mosques, and shrines. Many of these have been substantial edifices. Multan is one of the most ancient cities in India. It was taken by Mahmud of Ghazna in 1005; by Pir Mohammed for Tamerlane in 1398. After many vicissitudes it fell into the hands of the Sikhs, from whom it was taken by the British in 1849. Pop. (1901) 87,394.

Multiple Stars. See **DOUBLE STARS**.

Multiplication. See **ARITHMETIC**; **MATHEMATICS**.

Mul'titubercula'ta, a group of fossil mammals, of uncertain position, so called from the many tubercles developed upon the molar teeth. The group ranges from the Jurassic to the Eocene periods. Little is known of the animals except about the lower jaws and teeth. The character of these last had suggested that these forms belong near the Monotremata (q.v.) in the sub-class Prototheria (q.v.). The propriety of the term and the characteristics of the group are discussed by Beddard, in 'Mammalia' (1902).

Mumbo Jumbo, an African superstition; a bogie, hideous and malignant, who is the terror of negro women and children.

Mum'michog. See **KILLIFISH**.

Mummius, mŭm'ī-ŭs, **Lucius**, Roman consul: flourished about 185-130 B.C. He served as prætor in Spain and in 146 B.C. conquered Greece, where he burned and pillaged her finest cities, sending the art treasures of Corinth to Rome. He was made governor of Achaia with the surname Achaicus, and a triumph was held in his honor. He later became a censor, but of his last years and death little is clearly known.

Mummy (Arab. *mumia*), a dead body preserved from putrefaction by embalming or other means. The custom of thus preserving the bodies of the dead has prevailed in several countries. Humboldt found mummies in Mexico, and in Peru the bodies of the incas were rudely embalmed and dried. The Guanches, or aboriginal inhabitants of the Canaries, removed the entrails of the dead, dried the corpse in the air, covered it with aromatic varnish, and, wrapping it in goat skins, kept it in a wooden case. These mummies, of which thousands have been found, are light in weight, of a yellow color, and have a strong aromatic odor. But it was by the ancient Egyptians that the art and practice of embalming the dead were carried to the greatest extent and highest perfection. All the dead of Egypt were embalmed in some manner, partly, it is supposed, from religious motives, and partly for sanitary reasons. The notion formerly prevalent, that the Egyptians preserved the body in order to keep it in a fit state to receive the soul when it should have passed through its allotted transmigrations, is inconsistent with the facts that tombs were sometimes sold to later occupants, and that animals of all kinds were also embalmed. The origin of embalming among the Egyptians has been attributed to their first merely burying in the sand, impregnated with natron and other salts, which dried and preserved the body, which natural process they afterward imitated, drugs and bitumen being later improvements. It is singular that few

mummies of children have been discovered in Egypt, though even those just born were embalmed. Embalming was practised by the Hebrews to some extent. Joseph commanded the physicians to embalm his father, and in the time of Christ it was "the manner of the Jews" to bury the body "wound in linen cloths with spices." The practice continued in Egypt till the 6th century, and was common among the Greeks there, and even among the early Christians. It seems to have fallen gradually into disuse. See also **EMBALMING**; **EGYPT**.

Mummy Wheat, a variety of wheat said to have been produced from grains found in an Egyptian mummy; but there is no good reason to believe the legend. It has long been in general cultivation in Egypt and neighboring countries in Africa. The spike is compound.

Mumps, a popular name for a contagious epidemic inflammation and enlargement of one or both parotid salivary glands, occurring usually in youth. In some localities it disappears for years, in other places it is endemic. Epidemics usually occur in the spring or fall. One attack generally gives immunity. The disease is sometimes preceded for a few days by malaise, loss of appetite, irritability, and feverishness. Its onset is marked by stiffness and pain about the jaws, followed by heat, pain, and swelling about the lobe of the ear, fever (100°-104° F.), more or less rigidity of the neck, with distortion of the side of the head, and difficulty in chewing, swallowing, and talking. The inflammation is usually at its height by the third day of the disease, and the disease has subsided generally by the seventh or tenth day. Very seldom is there any suppuration of the affected gland. In some cases the subsidence of the gland inflammation is followed by pain and swelling of the testes of the male, and of the ovaries, vulva, and breasts of the female. Occasionally a meningitis supervenes. The term mumps is sometimes applied to a parotiditis following a local injury, diseases of the mouth, diphtheria, occlusion of the salivary duct by a foreign body, etc. There is a secondary symptomatic or metastatic form of mumps which sometimes follows dysentery, scarlet fever, smallpox, measles, etc. The parotid gland in this form of mumps tends to suppurate. The best treatment for mumps consists in rest, the giving of saline laxatives and soft food, relieving the fever, and securing sleep by mild remedies, and keeping the face warm with flannel, or some other agreeable application.

Mun, Thomas, English merchant and political economist: b. London, England, June 1571; d. there July 1641. He engaged in mercantile business when very young, was interested in the Mediterranean trade and in 1615 was a director of the East India Company. As a writer on economics he presents really the first clear and systematic treatment on the subject and his is admitted to have been of great influence. He published 'A Discourse of Trade, from England into the East Indies' in 1621, and his greatest work 'England's Treasure by Foreign Trade' was published posthumously in 1664.

Mun'by, Arthur Joseph, English poet: b. Bulmer, Yorkshire, England, 1828. He was educated at Trinity College, Cambridge, and was subsequently admitted to the bar of Lincoln's

CASE AND MUMMY IN ITS CEREMENTS

MUNCH — MUNDE

Inn. He has published 'Verses Old and New,' which contains the much admired pastoral poem 'Doris' (1865); 'Dorothy' (1880), which has been widely circulated in the poet's own country and in America; 'Vestigia Retrorsum' ('Steps Backward,' 1891); 'Vulgar Verses,' by Jones Brown' (1891), mostly in dialect; 'Susan' (1893).

Munch, moonh, Peter Andreas, Scandinavian historian: b. Christiania, Norway, 15 Dec. 1810; d. Rome 25 May 1863. He was educated at the University of Christiania, and studied deeply into the old Norse language and antiquities. In 1841 he was appointed professor of history at the University of Christiania. He was accorded the unusual privilege of access to the papal archives in Rome, where he spent much time in study. His principal work is 'History of the Norwegian People' (1852-63). Munch published several works of a linguistic character, and, repudiating the term "Icelandic," maintained that the so-called Icelandic literature was really Old Norse. He also translated several of the Old Norse sagas. A collection of his essays was edited by Gustav Storm (1873-6).

Munch, Peter Andreas, Norwegian poet: b. Christiania 19 Oct. 1811; d. near Copenhagen 27 June 1884. He was originally a student of law, but became an editor (1841-6) and professor in the university (1866) at Christiania. Among his writings are: 'Sorg og Trost' ('Grief and Consolation'), of which seven editions have been printed; 'Ephemera' (1836); 'King Sverre's Youth' (1837), a drama; 'The Singer' (1838); 'Poems Old and New' (1848); 'Pictures from North and South' (1848), in prose; 'New Poems' (1850); 'Lord William Russell' (3d ed. 1888), a tragedy; and 'An Evening at Giske' (1855), a historical drama. Munch translated into Norwegian many works from such authors as Tennyson and Walter Scott, and wrote some popular Norwegian songs.

Münch-Bellinghausen, münh' bēl'ing-how-zēn, Eligius Franz Joseph, BARON VON, better known as FRIEDRICH HALM, Austrian dramatist: b. Cracow 2 April 1806; d. Vienna 22 May 1871. He studied law, and held various official positions at Vienna. In his lifetime his popularity as a dramatist was very great, and several of his plays were translated into English. 'The Gladiator from Ravenna' (1854, 5th ed. 1893) is considered his masterpiece. Among other of his plays are: 'Griseldis' (1834, 10th ed. 1893), which had great success; 'The Adept' (1836); 'Camoens' (1837); 'Imelda Lambertazzi' (1838); 'The Son of the Wilderness' (9th ed. 1894), famous in England and America under the title 'Ingomar'; 'Wild Fire' (6th ed. 1894), a romantic comedy.

Münchhausen, münh'how-zēn, Hieronymus Karl Friedrich, BARON: b. Bodenwerder, Hanover, 1720; d. there 1797. He was a German soldier and served in his youth as a cavalry officer in the Russian army. He was possessed of an adventurous and dare-devil spirit, and an imagination that knew no bounds. He told the most wonderful stories of his adventures in the Turkish campaign of 1737-9, and soon became famous as the most unique exaggerator that ever lived. The tradition of the baron's

story-telling is supported by the evidence of a clergyman, who says that in his old days the officer used to relate his most surprising adventures "in a cavalier manner, with a military emphasis, but without any passion and with the easy humor of a man of the world, as things which required no explanation or proof." His tales are thought to have been first compiled by Rudolf Erich Raspe, a man of letters, who, being compelled to flee from his position as curator of the museum at Cassel to England on account of a charge of embezzlement, was engaged in London in literary pursuits, and is generally believed to have published anonymously an English edition of the stories under the title of 'Baron Münchhausen's Narrative of his Marvellous Travels and Campaigns in Russia' (1785). A second edition, enlarged and ornamented, was published at Oxford in 1786, under the title of 'The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munnichhausen,' commonly pronounced Munchhausen; as he relates them over a bottle when surrounded by his friends. A third edition, published by Kearsley in London the same year, bore the title of 'Gulliver Revived.' One of the best editions is that by Shore (1872), illustrated by Doré, with additions by Theodore Gautier.

It is said that a large proportion of the hunting tales are derived from Henry Bebel's 'Facetiæ' (1508), while other incidents are borrowed from Castiglione's 'Cortegiano' and Bidermann's 'Utopia,' which are included in Lange's 'Deliciæ Academicæ' (1765).

München (mün'hēn) Gladbach. See GLADBACH.

Muncie, mün'sī, Ind., city, county-seat of Delaware County; on the White River, and on the Chicago & S. W., the Lake Erie & W., the Cleveland, C., C. & St. L., the Chicago, I. & E., and the Cincinnati, R. & M. R.R.'s; about 50 miles northeast of Indianapolis. A belt railway encircles the city and furnishes intercommunication among the lines which enter the city. Muncie is situated in an agricultural region and in a natural-gas belt. In the vicinity are coal fields and glass-sand, and the river furnishes good water-power. The chief manufacturing establishments are iron and steel works, glass works, machine-shops, canneries, pulp and paper-mills, manufactories for silver and silver-plated goods, wagon and carriage works, and flour-mills. Other articles manufactured are gas engines and gas fixtures, men's clothing, knit underwear, caskets and undertakers' supplies. There is a large trade in the manufactures of the city, and in coal, farm products, and live-stock.

Muncie is the seat of the Eastern Indiana Normal University, a private school which in 1903 had over 400 pupils. The city has good public and parish schools, a public library which has over 14,000 volumes, a city hospital, court-house, and a number of fine churches. The government building cost over \$80,000, and the new (1903-4) library building \$50,000. The electric-light plant is owned and operated by the city. Pop. (1890) 11,345; (1900) 20,942.

Mundé, mün'dā, Paul Fortunatus, American gynecologist: b. Dresden, Saxony, 7 Sept. 1846; d. New York 7 Feb. 1902. After coming to the United States in 1849 he attended the

MUNDOS—MUNGOOS

Boston Latin school and then studied medicine at Yale. He left before completing his course, entering the Union army as medical cadet in 1864. He was afterward graduated from the Harvard Medical School in 1866, and went to Germany, where he enlisted in the Bavarian army. He was decorated by the emperor with the Iron Cross for heroism in saving the lives of patients from a burning hospital near Paris. After devoting himself to study and practice in hospitals in Berlin, Heidelberg, Paris, London, and Edinburgh, he took up his residence in New York in 1873, and practised obstetrics and gynecology. He was appointed professor at Dartmouth Medical College, and in the New York Polyclinic in 1882. He edited (1874-92) the 'American Journal of Obstetrics,' and was president of the American Gynecological Society in 1897-8. Among his works are: 'Obstetric Palpitation' (1880); 'Minor Surgical Gynecology' (1880); 'Appendix to the Midwifery of Cazeaux and Tarnier' (1884); 'Pregnancy and the Puerperal State' (1887); and 'Diseases of Women' (1891).

Mundos, mún'dós, heathen tribes living in the wilds of Panay and Cebu, Philippines. Little is known of their race and customs, and the name is a collective one applied to various different tribes.

Mundt, moont, **Klara Müller** ("MÜHLBACH, LUISE"), German novelist: b. Neubrandenburg 2 Jan. 1814; d. Berlin 26 Sept. 1873. She was married to Theodor Mundt (q.v.) in 1839. She was an extremely prolific writer of popular historical novels, which though quite without merit in point of style are by no means wanting in descriptive excellence. They were all published under the pen name of 'LUISE MÜHLBACH' and have had as many eager readers in this country and England as in the writer's own land. Among them are: 'Queen Hortense' (5th ed. 1861); 'Emperor Joseph II. and his Court' (9th ed. 1866); 'Marie Antoinette and her Son' (1867); 'Emperor Alexander and his Court' (1868); 'Mohammed Ali and his House' (1871); 'Frederick the Great and his Court' (8th ed. 1882).

Mundt, Theodor, German author: b. Potsdam, Prussia, 19 Sept. 1808; d. Berlin 30 Nov. 1861. He studied at the University of Berlin, and in 1842 became private docent there. In 1848 he was appointed professor of literature and history at the University of Breslau, and in 1850 was recalled to Berlin as University librarian and professor. He belonged to the "Young German" school, was a Radical in politics, and favored the emancipation of women. His writings include: 'Madonna, Unterhaltung mit einer Heiligen' (1840), a memoir of Charlotte Stieglitz; the novels, 'Thomas Münzer,' 'Carmela' (1844); 'Mendoza, der Vater der Schelme' (1847); 'Die Matadore' (1850); the critical and historical works, 'Kunst der Deutschen Prosa' (1837); 'Geschichte der Gesellschaft'; 'Geschichte der Weltliteratur'; 'Geschichte der Litteratur der Gegenwart' (1852); and political sketches included in 'Pariser Kaiserskizzen' (1856); 'Paris und Louis Napoleon' (1858); 'Italienische Zustände' (1859-60).

Munger, müng'gér, **Theodore Thornton**, American Congregational clergyman: b. Bainbridge, N. Y., 5 March 1830. He was grad-

uated at Yale in 1851, and at Yale Theological School in 1855. He held pastorates at Dorchester, Mass., 1856-60; Haverhill, Mass., 1862-70; and Lawrence, Mass., 1871-5. He was for several years pastor at North Adams, Mass., resigning in 1885 to become pastor of the United Church, New Haven, Conn. He has been prominent in his denomination as well as an active supporter of municipal reform. He has published: 'On the Threshold' (1880); 'The Freedom of Faith' (1883); 'Lamps and Paths' (1883); 'The Appeal to Life' (1887); 'Horace Bushnell' (1899); 'Character Through Inspiration'; etc.

Mun'go, Saint, or Kentigern, the patron saint of Glasgow: b. Culross about 518; d. Glasgow 13 Jan. 603. He was baptized and brought up by Saint Serf, the head of a monastery at Culross. His name, Kentigern or Cyndegyrn (from *ken* and *tigearna*), means head lord, and it is said that it was exchanged by the brethren of the monastery for Mungo, the beloved, on account of the affection they bore him. On leaving Culross Kentigern took up his abode as a missionary priest near the site of the present Glasgow. Here he was chosen bishop, but having troubles with the king of the Strathclyde Britons, afterward took refuge at Saint David's in Wales, and while in that region founded a religious establishment under a follower named Asaph, which afterward became the seat of the bishopric of Saint Asaph. Redderech, king of the Strathclyde Britons, recalled him to Glasgow, where he acquired a character of great sanctity. The city arms of Glasgow are associated with various legends concerning Saint Mungo, and the cathedral is supposed to be built on the site of his monastery. The parish of Saint Enoch, in Glasgow, is so called from a corruption of his mother's name (The-neu). A Life, written by Jocelyn of Furness about 1180, was published in Pinkerton's 'Vite Antiquæ Sanctorum Scotiæ.' Consult: Skene, 'Celtic Scotland.'

Mun'goos, or **Mongoose**, an ichneumon (*Herpestes griseus*), common in many parts of India, and closely akin to the Egyptian species ichneumon (q.v.). The mungoos is a burrowing, nocturnal, weasel-like animal, tawny yellowish-gray, 16 or 17 inches long, and with a long thick terete tail. It kills numerous birds, sucking their blood and leaving the body uneaten. It also with great adroitness seizes and kills many snakes, the formidable cobra included, usually avoiding the serpent's stroke by its quickness. Its excitement and ferocity in these encounters is almost indescribable. It is, however, commonly domesticated as a mouser in the Orient, and has been colonized in various parts of the world to destroy vermin, usually with sad results; hence the bringing of a living one into the United States has been forbidden by law since 1902. This animal was introduced into Jamaica and some other islands of the West Indies about 1872, and later in Hawaii, in the expectation that it would overcome the plague of rats in the sugar plantations. It did so, but it multiplied excessively, killed off poultry and insect-eating birds, reptiles and mammals, which were useful. Many of these animals changed their habits somewhat to accommodate themselves to the novel enemy, and the mungoos does not now multiply so rapidly as

MUNICH

at first, and does less damage. The same experience was had elsewhere, and has warned other countries to avoid a repetition of it. Consult: Blanford, 'Fauna of British India: Mammals' (1889); Morris, 'The Mungos on Sugar Estates in the West Indies' (1884); and 'The Field' (London, 13 July 1895).

Munich, *mū'nīk*, or **München**, *mū'n'hēn*, Germany, the capital of Bavaria, considered to be "the most uniformly beautiful city in Europe," lies on an extensive but uninteresting plateau, about 1,700 feet above sea-level, on the left bank of the Isar, with suburbs on the right, the river being crossed by nine bridges. The original nucleus of the town was at one time surrounded by walls and ditches, and entered by lofty turreted gates. The ditches have been filled up and the walls removed, but three of the old gates, with their loopholed and embattled flanking towers, still remain. In the older part of the town there are many old houses, irregular both in size and form, and of quaint but not unpicturesque architecture. This quarter, though it contains the government offices and many public edifices, is surpassed, both in extent and magnificence, by the new town, which has risen chiefly to the north and west, with almost unexampled rapidity and splendor, due to the art-loving proclivities of King Ludwig I. and his successors, who spent over 7,000,000 thalers in beautifying the city, and adorning it with buildings of almost every style of architecture, wide and handsome streets, and squares and gardens decorated with statues and other monuments. Near the centre of the city, between the Max-Joseph-Platz and the palace gardens, is the royal palace, consisting of an old central building of vast extent and two modern wings. From this great pile run at right angles to each other the two finest streets in Munich—the Maximilianstrasse and the Ludwigstrasse. The chief public buildings are the old town-house and the new, the latter in the Gothic style, considerably enlarged in 1899; the old palace and the Herzog Max Burg, now used as public offices; the post-office; the central station (1880); the chief customs house (1876-9); and the new palace of justice (1897). Buildings connected with art embrace the gallery of sculpture, or Glyptothek, an edifice of the Ionic order, containing a series of the finest ancient and modern sculptures; the Old Pinakothek or picture-gallery, another beautiful edifice, containing one of the richest collections of pictures in the world; the New Pinakothek, adorned externally with frescoes and containing only paintings by recent masters; the academy of arts, an imposing building in the renaissance style; the academy of the plastic arts (1885); the Schack gallery of paintings (1804), named from its donor; the Schwanthaler and Kaulbach museums, etc. Other collections are the Hof-und-Staats Bibliothek, with 900,000 printed volumes and 40,000 MSS.; the old Bavarian national museum, now used for art collections; the new Bavarian national museum (1800); etc. The chief theatre is the Royal and National theatre, with a lofty Corinthian portico. Munich is rich in monuments, which adorn its squares, gardens, and public promenades. Among the chief are the monument of Maximilian II., with his statue 26 feet high; and the colossal bronze figure of 'Bavaria,' 65 feet high,

in front of the "Hall of Fame," a Doric building containing busts of notable Bavarians. The "Gate of Victory," in imitation of the arch of Constantine at Rome, and the Propylæa, in imitation of that at Athens, should also be mentioned. The Hofgarten is a garden near the palace, finely planted, and surrounded by an open and richly ornamented arcade; the so-called English Garden is an extensive and beautiful park. The ecclesiastical buildings include the cathedral, founded in 1488, a vast pile, entirely of brick, with two lofty towers, terminating in domes 333 feet high; St. Michael's or the Jesuits' Church (1583), a handsome Italian structure; the church of the Theatines, another Italian structure, beneath which are the burial vaults of the royal family; the church of St. Louis, a modern building of brick, faced with white marble, decorated externally with statues by Schwanthaler, and internally by the finest frescoes of Cornelius; the church of All Saints; the basilica or church of St. Boniface; the Mariahilf church on the right side of the river; the three Protestant churches; and the Jewish synagogue. At the head of the educational institutions is the university, attended by about 4,000 students and with about 180 teachers. Closely associated with it are the university library; the Collegium Georgianum (1494), a priests' seminary; the Maximilianeum (1852), etc. There is also a high school of technology, and numerous other high class institutions for educational purposes. The industrial development of Munich lags behind its æsthetic development. Its stained-glass works, iron, brass, and bell foundries, lithographing and engraving works, and manufactories of optical and mathematical instruments, and various artistic articles are, however, deservedly noted. Still more famous are the enormous breweries of Bavarian beer, which annually produce about 49,000,000 gallons, of which 37,000,000 are consumed in the city itself. Munich carries on a large trade in grain and in objects of art.

In 1158 Henry the Lion raised the *Lilla Munichen* from its previous obscurity by establishing a mint and a salt-emporium within its precincts, the name (also appearing as *Forum ad Monachos*) being derived from the monks who owned the site. In the 13th century the dukes of the Wittelsbach dynasty selected Munich for their residence and fortified the town. In 1327 the old town was nearly destroyed by fire, and was rebuilt by the Emperor Louis the Bavarian; it was not until the fortifications were razed at the close of the 18th century that the limits of the town were enlarged to any extent. The true history of modern Munich is the account of its artistic development in the 19th century, closely identified with which are Klenze and Gärtner the architects, Schwanthaler the sculptor, Cornelius and Kaulbach the painters, and Wagner the composer. The modern Munich school of painting, headed by K. von Piloty and W. Diez, is characterized by marked realism in color and detail, in contrast to the romanticism of the older masters. The elevated site of the city and the neighborhood of the Alps render it liable to sudden changes of temperature, sometimes ranging over 20° in 24 hours. The population in 1801 was only 48,885, in 1900 it was 499,959; from 30.4 per thousand in 1871 the death rate fell to 24.1 in 1898.
